Dr. E. Jucker: I will try to explain my point. A patent law is enacted by a country for the protection of the patentee and for the protection of the inventor. If I say that 4 per cent is not enough, then I mean that compared with the inventor's effort and compared with the amount of money he has spent, it cannot be enough. I could not, of course, at the same time, take into consideration the national interest of India or of any country. I have to concentrate my thinking on the inventor. He is the one who spends money and in order to continue his research work, in order to continue to contribute for further progress he needs certain remuneration and this he would not get if 4 per cent is fixed because after taxes it would mean only 2 per cent which is too little to be considered proper recompense.

Shri R. Ramanathan Chettiah: I would like to refer to a survey made by the Reserve Bank of India which was published in their bulletin wherein it is stated that in 1962-63 on an investment of Rs. 14 crores by foreign interests in the pharmaceutical industry they had remitted Rs. 2 crores by way of remittances and Rs. 5 crores by way of royalty from our country. So, don't think their profits are meagre as you are trying to make out.

Dr. E. Jucker: I am not trying to make out any case.

Shri R. Ramanathan Chettiar: I may just point out to you that 50 per cent of the capital they have taken out. This is a counter reply to your point that 4 per cent is not enough. Considering the stage of development of our country, some people think that even 4 per cent is too high.

Dr. E. Jucker: Looking at it from the point of view of the patentee it is very little and it is not enough to be considered just compensation.

Shri B. K. Das: Do you want the percentage of royalty to be fixed or it should be left to be settled by negotiation? If you want it to be fixed, how would you like to fix it?

Dr. E. Jucker: I think it is a very important question. First of all, I think it is wrong to fix the royalty because sometimes 4 per cent is too much and sometimes it is by far not enough. I think the royalty must be established in every case individually. First of all, it must be discussed between those who wants to buy something and those who want to sell something. One invention might have cost 10 million dollars to develop and another invention only 500 dollars. So, why should the percentage of royalty be the same for both? A very good comparison is the British system. In Britain there is a proviso for compulsory licence and royalty is established by the Controller of the Patent Office. He fixes for example at 10 per cent. But in England it is not of the bulk price but of the price of the speciality and the decision of the Controller is subject to High Court decision. In one of the most recent cases it was fixed at 18 per cent because the court felt that the patentee has invested such a terrific amount on his invention that one who gets results must contribute something to the research expenditure. I believe that in each individual case it should be discussed, perhaps together with the Controller of Patents.

Shri B. K. Das: If the parties are not satisfied with the decision of the Controller, you want the matter to go to the court or to the Government?

Dr. E. Jucker: It should go to the court.

Shri B. K. Das: You do not like the provision about licensing rights even for a country like India?

Dr. E. Jucker: No.

Mr. Chairman: Even countries like USA and Germany have a provision for licensing rights.

Dr. E. Jucker: No, India is the only country which has got such a provision.

Mr. Chairman: UK has it.

Dr. E. Jucker: I am sorry to contradict you. It is different. It is this way. In various countries the inventors themselves have the right to endorse their patents with the words "licence of right" but in each case it is done individually if the patentee wants to offer his invention for licensing. In the Bill it would be done automatically without the patentee's consent with all pharmaceutical patents. That is the difference.

Shri P. S. Naskar: You have laid so much emphasis on research and basic research of which you are a a scholar. Do you thing that research expenditure is a factor for the high prices of drugs?

Dr. E. Jucker: It is one of the factors.

Shri P. S. Naskar: You said a little while ago that 8 to 10 per cent of the total turnover is spent on research. After that statement, how do you say that it is a major factor for high prices of drugs?

Dr. E. Jucker: I would not say that it is a major factor.

Shri P. S. Naskar: Do you consider that research expenditure is one of the main factors for high prices of drugs? believe that drugs are sold at too hih consider that research expenditure is

Dr. E. Jucker: First of all, I do not believe that drugs are sold at too high a level.

Shri P. S. Naskar: In India.

Dr. E. Jucker: I do not know the Indian price structure.

Shri P. S. Naskar: You said that you have visited India five or six times Do you not care to find out about antibiotics and other life-saving drugs, whether they cost more in India than in other countries? You have come to give evidence before this Committee and I thought you should have had a little information on that point.

Dr. E. Jucker: I am very sorry. I came here as a research chemist and not as an expert on prices.

Shri P. S. Naskar: You made out the point that patent is necessary for an incentive to research; so, I am asking you whether you think that research expenditure is one of the main factors for high prices of drugs. We in India consider that drugs imported into this country from America, Switzerland and other places are costlier than in other countries.

Dr. E. Jucker: It is a very good question, but it is not easy to answer.

Shri P. S. Naskar: If you have no answer, please say so.

Dr. E. Jucker: I would like to tell you that one of the major factors is the packing of the drug for which we are not responsible. The aluminium tube or a proper packaging sometimes is so costly and we can do nothing about it.

Shri P. S. Naskar: I am restricting my question only to research expendi-

ture. I am not going into allied expenditure. Would you say that research expenditure is one of the main factors?

Dr. E. Jucker: Yes, Sir.

Shri P. S. Naskar: If I asked you to give a detailed financial statement of your company, that is, Sandoz....

Dr. E. Jucker: In Switzerland these figures are published; they are available to the public. I do not know how they are handled here.

Shri P. S. Naskar: From your detailed financial statement could you show that research expenditure is higher than 8 to 10 per cent of the total turnover and how much is spent on fundamental research out of those funds for research?

Dr. E. Jucker: When I am speaking about basic and fundamental research, I mean research which is not carried out for the specific purpose of finding out a drug; therefore, our expenditure does not go into what I call basic and fundamental research because that is done by universities.

Shri P. S. Naskar: So, basic research is mainly done in universities or public laboratories.

Dr. E. Jucker: What do you understand by "basic research"?

Shri P. S. Naskar: You said "fundamental research".

Dr. E. Jucker: By "basic and fundamental research" I mean research not direc ly applicable to drugs.

Shri P. S. Naskar: So, basic research has nothing to do with patent. Do I take it?

Dr. E. Jucker: No, Sir.

Shri P. S. Naskar: You said that Sandoz has got only one patent perhaps in this country.

Dr. E. Jucker: Not patent; I said that of our products not more than two are patented.

Shri P. S. Naskar: That means, most of the Sandoz products in this country are unpatented. Has that affected your sales in this country?

Dr. E. Jucker: This cannot be answered because up till now we have been working under the old law.

Shri P. S. Naskar: You say that a patent is necessary for all drugs, but, at the same time, you say that Sandoz has one or two patented drugs; mostly they are unpatented drugs which are sold in this country. That being the position, how has it affected you?

Dr. E. Jucker: I assume that if we had patented all our products our sales would be higher; but it cannot be established because we do not have the patents any more.

Shri P. S. Naskar: It has not affected the sale.

Shri E. Jucker: Of course, it has affected.

Shri P. S. Naskar: Have your sales increased or decreased?

Dr. E. Jucker: Of course, they have increased but with some exceptions If you have competition with those who sell the same substance without having had the research expenditure the price is probably pressed down.

Shri P. S. Naskar: The relationship is between sale of the product and patent, which is not all the time correlated.

Dr. E. Jucker: It must be correlated.

Shri P. S. Naskar: But here you are making so much money on inpatented drugs.

Dr. E. Jucker: I do not know how much money we are making here, but these drugs have been on the market

for so many years and are sold for their quality and the firm's name.

Dr. C. B. Singh: How does payment to a research worker compare with the payment to the administrative head of your department?

Dr. E. Jucker: In my country research workers are paid very well, usually higher than the corresponding ranks in administration.

Dr. C. B. Singh: How much money has your firm spent on research in this country?

Dr. E. Jucker: I am sorry that I am not in a position to answer this question because I do not know the exact figures; but we spend quite a lot of money. I can say that for the following reasons, about ten years or so ago, we extracted a compound from an Indian plant podophyllum. This plant is not available in larger quantities. We had to cultivate it first; the whole botany cultivation and everything had to be studied. We have farms established and we are spending lots and lots of money millions of rupees, on drug research in the natural products field. The exact figure I do not know.

Mr. Chairman: We have the information that international prices of some of the patented drugs are far lower than the prices that they are charging in India; if that is so, do you not want that the Government should take some steps to control prices by way of limiting the period or working of the patent?

Dr. E. Jucker: This question is a very important one, but I do not know the figures.

Mr. Chairman: If you want, I will give you the figures. Vitamin B-6 sells here at Rs. 800 per kilo whereas the international price is Rs. 206 per kilo. The international price of Vitamin B-12 (Merck, Sharpe and Donme) is Rs. 32 per gm. while the indigenous price is Rs. 215 per gm. The international price of chloramphenicol (Parke Davis) is Rs. 100 per kilo whereas the indigenous price is Rs. 410 per kilo. Tolbutamide—the international price is Rs. 20 per kilo and the indigenous price is Rs. 75 per kilo. Vitamin A (Glaxo)—the international prices Rs. 54 per kilo and the indigenous price is Rs. 421 per kilo. Procaine Hydrochloride—Rs. 8 per 500 gm. is the international price and Rs. 21 per 500 gm. is the indigenous price. Tetracycline Hydrochloride—Rs. 107 per kilo is the international price and Rs. 1,147 per kilo is the indigenous price.

Dr. E. Jucker: How was the international price established? For example, Tollulamide is marketed—it is Upgoha product—and there is no such figure of international price for Toleulamide. Is it the price for the bulk? Is it for speciality? All this must be taken into consideration. Do you take into account the packaging cost? The packaging in this country is much more expensive than what it costs in other countries because of the climate. This must also be taken into consideration. Only then, one can compare the prices. May I say your approach is not too good. I think the drug prices must not be controlled by the patent system. Our experience shows quite clearly that in a country like Italy where there is no patent system for pharmaceuticals, the drugs are not cheaper there. Many of the items are very expensive. I do not see how we can relate the prices of pharmaceuticals with the patents system.

Shri D. P. Karmarkar: Along with the grant of patent, you get the exclusive right of sale and, therefore, it is expensive. It is just possible that the prices are lower in the world market because there is competition. Here, because of the protection, the product costs more.

Mr. Chairman: They have a patent for exclusive manufacture and for sale.

Dr. E. Jucker: May I ask one question? Why the cars manufactured in this country cost more than two times or so as compared to the cost abroad?

Shri D. P. Karmarkar: In respect of cars, we have not given them the exclusive right of importation and sale. Now, the moment you get a patent, you have the right to import your own product. It is a fact that what costs Rs. 120 in Switzerland costs Rs. 300 or Rs. 500 here depending on the price. I wish you appreciate that there is a strong feeling in this country. In order to meet the reasonable requirements of the peop'e at reasonable prices, the State may have the power to intervene. If you are going to be unreasonable, then we shall see to it that you are reasonable. That is the point.

Dr. E. Jucker: May I say one thing. The hon. Chairman was going through the list. Not all the drugs that were mentioned are patented. Therefore, this difference in price also exists in respect of those drugs which are not patented in India. So, according to my humble opinion as a chemist, there must be other reasons as to why the drugs are costlier here than abroad and I do not think that the answer to this problem which is a very severe one is patents.

Mr. Chairman: Thank you very much.

Dr. E. Jucker: Thank you, Sir.

(The witness then withdrew)

(The Committee then adjourned)

MINUTES OF EVIDENCE GIVEN BEFORE THE JOINT COMMITTEE ON THE PATENTS BILL, 1965

Saturday, the 23rd April, 1966 at 09.30 hours.

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Shri Panna Lal Barupal
3. Shri Dinen Bhattacharya
4. Sardar Daljit Singh
5. Shri Basanta Kumar Das
6. Shri V. B. Gandhi
7. Shri Kashi Ram Gupta
8. Shri Prabhu Dayal Himatsingka
9. Shri Braj Behari Mehrotra
10. Shri Bibudhendra Mishra
11. Shri P. S. Naskar
12. Shri R. Ramanathan Chettiar
13. Shri Sham Lal Saraf
14. Dr. C. B. Singh
15. Shri Balkrishna Wasnik

Rajya Sabha

16. Shri Arjun Arora
17. Shri Vimalkumar M. Chordia
18. Shri R. S. Doogar
19. Shri D. P. Karmarkar
20. Shri B. T. Kulkarni
21. Shri Dahyabhai V. Patel
22. Shri Mulka Govinda Reddy
23. Shri R. P. Sinha

REPRESENTATIVES OF THE MINISTRY

1. Shri K. V. Venkatachalam, *Joint Secretary, Ministry of Industry.*
2. Dr. A. Joga Rao, *Controller General of Patents, Designs and Trade Marks, Bombay.*
3. Shri S. K. Borkar, *Drug Controller of India, Ministry of Health.*
4. Shri B. N. Atrishi, *O.S.D., Ministry of Industry.*

DRAFTSMAN

Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESS EXAMINED

Prof. G. H. C. Bodenhausen, *Director of United International Bureau for the Protection of Intellectual Property (BIRPI), Geneva.*

Prof. G. H. C. Bodenhausen, Director of United International Bureau for the Protection of Intellectual Property (BIRPI), Geneva.

The witness was called in and he took his seat.

Mr. Chairman: Mr. Bodenhausen—we have received your memorandum. The evidence that you give here will be printed and published and distributed to the Members and also laid on the Table of the House. If you want anything to be kept confidential, even that portion will be printed and distributed to the Members of the House. Your memorandum has been distributed to all the Members. If you want to add anything, you may kindly do so.

Prof. G. H. C. Bodenhausen: With your permission I would like to add a few words to the memorandum that has been distributed.

My first remarks concern my personal background because I think members should know something about me to understand my position better. I have been a Barrister since 1928 and took the first patent case in 1931. Afterwards more patent cases and trade-mark cases followed and I have become a specialist in this field. In the last 15 years of my practice I have not taken any case but cases of patents and industrial property and my experience is mainly with patents and trade marks within my country, the Neitherlands. I have been appointed in 1946 as Professor of Intellectual Property Law in the University of Utrecht and I had an opportuniy to teach industrial property law especially patents for 16 years. Then of course I acquired a more general knowledge because I had to survey also other legislations on patents. Then in the beginning of 1963, 3 years ago, I became the Director of the United International Bureaux for the Protection of Intellectual Property in Geneva which, as you may know, is an inter-Governmental organization and the joint secretariat of the Paris and Berne Unions. India, while it is a member of the Berne Union for the protection of copyright, is not a member of Paris Union for the protection of industrial property like patents and trade marks. This latter convention now comprises 74 States—75 States if you take into account the German Democratic Republic. The composition and membership of the Paris Union makes it obligatory for us to be completely neutral—politically neutral and as far as we can technically neutral too. Amongst its members are not only important industrialised countries of the West such as the United States. U.K., Federal Republic of Germany, France and Japan but also all Communist States including the Soviet Union, with the exception of China and Albania Part of our membership consists of States which have a highly developed industry and are very prominent in industry and commerce such as the USA. But a large majority of the Member States are of course developing countries—Many in Asia, many

in Africa and some also in Latin America. This is just to tell you why our approach to problems in the sphere of patents and trade marks has to be neutral and objective.

We try to give, if desired by countries, technical assistance. I have not come here to convince you of anything. I am here at your disposal. If you want to put questions to me I will try to answer them to the best of my knowledge.

But I want to tell you at the start that I do not want to take sides on your Patents Bill. It is your responsibility. I am here to tell you what I think of it as being a Patent specialist for many many years and in charge of an international organization in this field. We have some experience also with the problem of giving technical assistance to developing countries in the field of patents and more with industrial property in general. We have organized seminars in different parts of the world—the first one was held in Africa, the next was in Latin America and the third was held in Ceylon where we had also representatives of India who participated in this Seminar. We had fair and frank discussions on all the problems of industrial property which are interesting to developing countries. I know there connot be any comparison between some of these countries because of differences of development, size and interest. We have had many dealings with them. I think we are making progress in understanding their problems. We have made a Model law on patents and are now working now on a Model law on trade marks. We have a programme of training. We have trained officials--many patent officers of developing countries, who wished to improve their knowledge and we also give technical assistance to Governments which require such assistance on their legislative and administrative problems. We gave assistance to the Government of Algeria on their Patent law and we have given the same assistance to other African States, for instance, Uganda, Kenya and Tanzania. We have assisted the Governments of these countries in drafting patent legislation, of course leaving the entire responsibility to them. I will take one example, Algeria. There they have a new patent law which came into force on 1 March this year. They have ordered that patents or inventors certificates derived from the Communist System can be taken out at the choice of the interested enterprises or men, but for nationals only an inventor's certificate can be granted and no patent. I personally think that this regulation is unwise. It creates an imbalance in the economy, but it is their decision. I have not tried to convince them that it is not the right way to deal with the problem.

I want to come now to the Patent Bill which is before you. I hope that you will not identify me with any particular interests, neither with any group of industries or commercial people nor with any group of States, because in my organisation all States are equal and we do not take sides at all. I am here—I repeat—to give you my views to the extent you wish and not to convince you. The only point of view which is valid on this issue is what is good for India. I have tried very hard to live with this problem in this sense that I can feel what you need and give you advice as to what will be the best procedure to get what you need. My memorandum has also been drafted only from this point of view and I have to apologise to you for the rather critical tone of it. I had to strike this tone in order to make my point clear and to warn you that in my view you will not succeed with this Bill as it stands. In a few moments I will explain my views. Of course, it is true that this Bill has good points too and it has even definite improvements over the U.K. law, which clearly has been the starting point also for the existing Indian Patent Act. The principle of absolute novelty which is introduced now in

your Patents Bill and also the fact that the non-obviousness of an application has to be examined from the start—that from the first moment it has to be judged whether there is invention or not—not as in England where it is left to be considered in a further stage, are the two main improvements.

Mr. Chairman, I regret to repeat that my main impression of the Bill is that it will not be good for India and the reasons are these. I think there is—it is perfectly justified also—a fear of patents, the fear of the restraint of competition which patents may cause. But this fear has overshadowed to a very large extent all other considerations. In the Bill, as it stands, the good influence of patents has practically disappeared. No doubt this Bill is against the abuses, but a patent law is supposed to do some good too. The fight against the abuses has been so strengthened in the Bill that I don't see it will work to a good purpose any more. I will explain that more fully. The country I come from does not have tigers, but you have plenty of them. They are dangerous animals; they are obnoxious and they can present dangers to the society. The measures which have been taken in this Bill reminds me of another measure—which you may take—by which you decide to do away with all animals, to eliminate the danger of tigers. To be sure that all tigers will be killed you would kill all animals. Surely the balance of Nature will be upset. It is not a logical measure which would kill both the advantages and the disadvantages of animals.

On page 5 of my memorandum I have pointed out a few technical features which are most important. The main point is that the very short duration of a patent would not encourage anyone to start an industry, because when the industry starts, the patent will be about to lapse. The intention will have no protection during the time he needs it. Another difficulty lies in the very large powers given to the Government. I know this comes from the British law. Only the countries in the British Commonwealth are under the influence of the British legislation and in no other country such powers are given to the Government. In other countries, if the Government wishes to exploit a patent, it has to take a licence like anybody else. Sometimes they may have to obtain a compulsory licence. The English system dates back even before the Statute of Monopolies in 1624 when the patents were considered a monopoly given by the State, by the Crown, freely and arbitrarily. The Crown then retained of course the power of use for itself, which in modern technology and modern political and economic circumstances, I think, is not justified any more. It is certainly not justified to the extent in which it practically destroy the encouragement which is exists in the patent system to establish industries. Then, under the system of compulsory licences and the automatic licence of right, the patentee has only the right of remuneration. It has been fixed in some cases at 4% which seems unscalistic. If I may add a few words in general about the usefuless and the dangers of a patent system not only with respect to India but for the economy of any country, the patent system is only one of many many factors that influence the national economy. There are many other factors like the security of investments, education of labour force, tax facilities and so on. The patent problem may not even be a major one. It is scientifically impossible to prove the value of a patent system. We cannot compare the same situation of the same country in the same period with and without patents. It remains an impression. It is like your getting well after taking medicine for some time. It may be that you would hav got well also without medicine but when? Nobody can prove that it is because of the influence of the medicine you have got well. On the basis of the experience that many people have taken the same thing and become well, you can pro-

bably form to the impression that the medicine has helped you also. The same is the case with the patents. When we compare the U.S.A. and Japan and see that their patent laws have proved a success, we feel that a good and strong patent system has a healthy influence on industrlialisation It encourages research and it encourages investment in industries. I agree it is not scientifically proven, but it is the impression we get when we see the patent system in operation in different countries.

I think another advantage you get is that the patent system provides more transfer of know-how under licence contracts. You get better know-how. It enables you to carry out inventions in the best conditions.

There is an interesting statement in the recent report of a United Nations body. It is in the report of the Advisory Committee on the Application of Science and Technology to Development. It says, even complete and frank disclosure cannot invest the recipient with the integrated operative experience needed to assure the effctive and economical adaptation and utilisation of the technology involved.

Now, what are the advantages and what are the dangers of the patent system? I will first deal with some dangers. Of course, the system has dangers. First of all a patent is temporarily a monopoly which can put limitations to the manufacture or importation of useful materials or substances. Its effect is also in most countries to enlarge foreign influence. In many countries, almost all countries, the number of patents taken out by foreigners is greater than the number of patents taken out by nationals. The exceptions are only some industrial giants such as Soviet Union, United States, Federal Germany and Japan where local industry is so strong. There inventions are so many that they beat all the other countries together. But in almost all countries the situation prevalent is that foreign patents out-number national patents. I am familiar with Netherlands and where we have more than 70 per cent foreign patents. It is not entirely disadvantageous because under the foreign patents you can have national licensees. This is the way the patent system normally operates.

The other disadvantage or danger is high prices which is no doubt uppermost in your minds. Under a patent system prices can be higher because the patentees and licensees can control more and there is no free competition. Nevertheless, this has to be considered with great care even in the case of medicines. There is one country in Europe—Italy—where patents are available neither for medicines alone, nor for processes to manufacture medicines. On this basis one would expect that the prices of medicines would be lower in Italy than elsewhere. I do not think this is true. I think in the free competition prices have a tendency to go up because of competition. The competitors make propaganda and publicity and spend more on these than on research. It is however true that patent do not lower prices. The price factor is certainly important and especially in India. What is the remedy for this? It is really necessary to do away with the patent system or part of the patent system or should there be price control by law allowing the patentee or licensee the right to produce or import at fixed prices and if he does not wish to accept these, be subject to a compulsorily licence? Which is more flexible?

I would like to draw your attention to a few comparisons with other countries. The comparison I have in mind is on the one side United Kingdom and on the other side Japan. The United Kingdom patent law is not a very strong patent law when you compare it with other laws of countries which can be compared with United Kingdom. They have a number of exceptions, compulsory licences, shifting of the onus of proof, etc. which

are unusual. I remember the time when this law came into being. It seemed doubtful then whether it could give strong inducement to industries which any patent law is supposed to have. I do not know how for the United Kingdom can get away with that. There is now some economic illness in that country. I do not think it can be attributed to the patent system alone, but perhaps to some extent the patent law is responsible.

Now take the case of Japan which was completely ruined after the last war. Maybe under pressure from Americans, the Japanese adopted a strong patent law. It is even one of the strongest in the world. It may not be entirely due to this that Japan has come up. There may be other reasons. For instance, Japanese are industrious. They have a well developed technology. Maybe they have a good tax system. I am not a tax specialist and therefore I cannot speak of tax system. But one of the many factors influencing industrial development is whether your patent law is good or bad. After giving these examples of United Kingdom and Japan, I will wind up with one other remark.

It is a pity that India is not yet a member of the Paris Union. That would have been better for purposes of consultations with your Government on the modifications of the patent law in order to strive what in my view would be a better balance. It is unfortunate. Nevertheless, I am very happy to be here to give my opinion and have an exchange of views with you. You would have to make a choice whether to keep this Bill or to throw it out. I would say that some of the provisions are good or at least they may be worth while trying. In other respects, I fear it will lead to disaster in the field of patents. One of the things you have to think about is the exclusion of patents in regard to pharmaceutical and chemical products. This exists in many other countries. It is for you to decide whether it is good or bad. I think you have your own experience. If you do not like it, try it without. A thing you should not keep is the limited duration of patents, that is, ten years. It is really too short. Nobody will ever dream of investing his money under a patent when it lapses the minute you invest and you start operation. It should be at least raised to 14 years. I am strongly of the opinion that this should be amended. Government powers are also in my view developed too far. How can you expect anybody to invest lot of money under a patent when he knows Government will be his foremost competitior? He will ask himself the question: Shall or shall I not build an industry in India? He will not do it if the Government could come in and compete royalty fee. Also, compulsory licenses should be limited. They go too far. I don't think this Bill will be good for the development of industry in India.

Thank you very much.

Dr. C. B. Singh: You just now mentioned that India is not a member of the Paris convention. Do you know the reason for that? What is that?

Prof. G. H. C. Bodenhausen: I don't know the reason. The reason may be, or may have been that India wanted to conserve more liberty in drafting legislation.

Dr. C. B. Singh: Government of India must have some good reason not to become a member of this convention. Will you be able to throw light on that?

Prof. G. H. C. Bodenhausen: I am not informed of the reasons.

Mr. Chairman: He does not know.

Prof. G. H. C. Bodenhausen: The reasons are not known to me.

Dr. C. B. Singh: In respect of changes you have mentioned monopoly and heavy foreign influence and prices. Last item is prices. We are concerned with this part of it. How can we safeguard the interest of the general public in this price part of it? Can we do

something by which prices can be so adjusted that heavy charges need not be paid? The prices should be reasonable—not harming the investor, not harming the consumer, not harming the Government. What will you suggest?

Prof. G. H. C. Bodenhausen: There is this proposal of mine to introduce in this Bill the power for the Government to fix prices for patented products. The Government can fix a maximum price. When the patentee does not accept the price he will stop production or stop importation, but then becomes liable to compulsory licences.

Dr. C. B. Singh: What is the basis for fixation of price? Is there some scientific data or what do you suggest?

Prof. G. H. C. Bodenhausen: I don't think you can generalise in this matter. It depends upon various things—it varies from one field to another. You can empower government to fix prices for patented products of drugs from patented processes. There should be some organisation for this including technical and economical experts.

Dr. C. B. Singh: A case was made out that heavy price is one of the reasons, as, they spend lot of money on research. That is what they say and our opinion is this. They spend not so much on research, but on processing, and advertising and other things. One suggestion is made that that money should be earmarked for research. What do you suggest? Can they earmark certain percentage of profit by which research could be encouraged? What do you suggest for that?

Prof. G. H. C. Bodenhausen: It is difficult to suggest a solution. You cannot force an entrepreneur to invest. There may be a period when research is carried out to a great extent. There may be another period when the product described has to be developed and so on and so forth—I don't think you can make a rigid rule. I don't think you can give a general solution to that problem. When the patent system is strong the patentee will, of necessity, invest in research. He will expect that by research he will find out new things and he will profit by such research. When you have a system of price control it is not feasible and not necessary to make a provision that the patentee has to spend all that money on research. That should be left to his discretion.

Dr. C. B. Singh: You said that one of the worst feature is the fixation of the period of ten years. You said ten year period is not advisable, it is one of the worst features, etc. What do you sugegst for that? There are two extremes: One is, no period at all; another view is, have it for 20 years. We have brought down a compromise and we have fixed 10 years. What do you suggest now in this regard?

Prof. G. H. C. Bodenhausen: It is all right having 16 years with possibility of extension in cases where the patentees for some objective reasons have not earned a profit.

Shri Basanta Kumar Das: The Bill should safeguard against the abuses. You said about that. Have you got any idea as to how the abuses are prevailing in our country? What are the abuses that are prevailing in this country?

Prof. G. H. C. Bodenhausen: They are the same abuses you find everywhere. There is the lack of local manufacture and importation sometimes at fairly high prices. The procedure of control may be improved. But the means for this are already there under the existing Act.

Shri Basanta Kumar Das: There is too much of profiteering in this country. Prices of medicines are so high, patented or imported. Do you know some such cases?

Prof. G. H. C. Bodenhausen: I do not know the figures. There may be some cases of high prices in comparison with

other countries, in the East. One thing we should remember. The patentees are not angels. I think every Government and every country is entitled to protect itself against prices that are to high. I do not see any objection to it. Only you should not abolish for that the whole Patent system.

Shri Basanta Kumar Das: But here the Patentees are not manufacturing the product but simply importing them. How can we prevent this abuse?

Prof. G. H. C. Bodenhausen: Both in your existing Patents Act and in the present Bill you have got provisions for compulsory licences and you can apply these. May be it has not been done many times. It may be due to two factors, I believe. I am not absolutely well-informed about Indian Law of procedure. I believe the procedures are cumbersome. Also when there is a threat of compulsory licence, many times people come to terms because otherwise there will be enforcement. So the patentee prefers to grant a licence voluntarily and he would then also give the technical-know-how which is very important.

Mr. Chairman: So, when the patentee abuses his patent you support the compulsory licence provision that is in the Bill?

Prof. G. H. C. Bodenhausen: Yes; only that should not be overdone.

Shri Basanta Kumar Das: Do you think that the provisions of the Patent Law which is already in existence in this country i.e. the 1911 Patent Act are better than the provisions of the present Bill?

Prof. G. H. C. Bodenhausen: Yes.

Shri Basanta Kumar Das: In your opinion we should continue that Act?

Prof. G. H. C. Bodenhausen: I would prefer the existing Act; I would much prefer the existing Act to the present Bill. Of course the present Act can be improved. You can make a few improvements for instance, in procedure; making compulsory licence more accessible and cheaper to get. But I think when you change from the existing law to a law according to the Bill, you would be taking a step backward. It will be a disadvantage to your economy and scare away foreign investors.

Shri Basanta Kumar Das: But as regards investment by other countries in our country we want foreign investment in this country as we are still in the developing stage. In your view this Bill will shut the door completely.

Prof. G. H. C. Bodenhausen: I won't say 'completely', but it will gravely endanger the situation.

Shri R. Ramanathan Chettiar: In your remarks earlier you had said that you do not represent any interests or you do not represent any point of view while giving evidence before this Select Committee. But from the course of your remarks one has to come to the conclusion that you are representing some vested interests who want to have a monopoly in this pharmaceutical industry because you yourself said 16 years and you yourself said that the present Bill is not good in the larger interests of this country and there practically you are voicing the view-point of the vested interests in the pharmaceutical industry. There is one other point and your reasons have not been convincing for us to come to the conclusion...

Mr. Chairman: It is not fair to comment like that. He has given his opinion. You may have your own.

Shri R. Ramanathan Chettiar: He had requested us saying that he has come here as a dis-interested person.

Shri Sham Lal Saraf: I object to this sort of question.

Mr. Chairman: He has given his opinion.

Prof. G. H. C. Bodenhausen: I have no objection to answer that.

Mr. Chairman: He has given his opinion. You may have a different opinion. You can ask questions on facts.

Shri Arjun Arora: The witness is prepared to reply.

Shri R. Ramanathan Chettiar: He is prepared to reply. Had he not said that, I would not have asked him this question.

Mr. Chairman: It is not fair.

Shri R. Ramanathan Chettiar: I have no other question.

Prof. G. H. C. Bodenhausen: It is true that I represent any particular interest, especially in pharmaceutical industry. But, of course, when one studies on a subject like this—the Patents Bill—and one asks self whether this Bill will work well or not, in my view and within my limited experience, the conclusion is that the Bill will not work to the satisfaction of India. The fact that I do not represent or cannot be identified with the interests of pharmaceutical industry is proved by the fact that when summing up I said that if you want to make some changes, you can keep the exclusion of patentability of pharmaceutical substances. If I represented the pharmaceutical industry, I would not have said that.

Shri R. Ramanathan Chettiar: There is another point. How do you say that the present Bill will retard the possibility of foreign investment in this country?

Prof G. H. C. Bodenhausen: Not only foreign investment but also any investment by Indian entrepreneurs. In my view they will be very hesitant to do under the provisions of the present Bill as there will be constant danger. Government will have a free right; there will be compulsory licences and licences of right and the patent will have a very short duration.

Shri R. Ramanathan Chettiar: There are countries which are members of the Paris Convention where the Patent Law is far stricter than as envisaged in our Bill. Yet, it has not retarded the foreign investment.

Prof. G. H. C. Bodenhausen: I do not know any existing Patent law which goes so far in limiting patent rights.

Shri R. Ramanathan Chettiar: Your own country—Netherlands.

Prof. G. H. C. Bodenhausen: No We have a compulsory licensing system just enough for the general interest and the interests of industry. After 3 years you can apply for compulsory licence. Nothing wrong that. It is much weaker and there is no revocation at all like the Japanese law. I think I can fairly say—I have not studied all the Patent Laws of of the world—as far as my knowledge goes, this Bill goes much farther in limiting the Patent system than anything I know.

Shri Arjun Arora: What do you think about the proposition that a country should give patent rights only to those who are prepared to and actually do manufacture the patented item within the country and do not utilise their right of patents to import?

Prof. G. H. C. Bodenhausen: Under that system you can get the patent only when you commit yourself to exploitation in the country itself and not import. The difficulty is this. At the moment one applies for a patent nobody can know what he can invest. It is dependent upon various circumstances on labour force, on establishment of industries, on transport, so may problems are involved. It is better to make the patent freely obtainable but then the patentee has to

exploit. If necesseary there will be a compulsory licence. That will be a better system than to grant the patent only on the condition that patentee will exploit.

Shri Arjun Arora: The proposition which you advocate, in more ways than one, gives the patentee such a right to go on importing for a long time to come.

Prof. G. H. C. Bodenhausen: There should be a procedure quicker and less costly for giving compulsory licences. When you have this, this evil system of importation for a long period will disappear.

Shri Arjun Arora: Is it so, that because of the existing patent law prices of drugs and medicines are abnormally high? Should they be less privileged?

Prof. G. H. C. Bodenhausen: You can limit prices in many ways. Government can fix prices. For that it is not necesseary to abolish the patent system. That was my point. I would remind you of the example of the tigers.

Shri Arjun Arora: What do you advocate as plausible reasons for the period of 16 years—which is fairly long period?

Prof. G. H. C. Bodenhausen: I have no special preference. I don't think it is wise to change your law. 16 years is not a long period. Other countries have 18 years or 20 years. The position is this. In modern technology inventions age quite rapidly. Many inventions are useful only for three or four or five years. But there are also exceptions, and for these cases it is not wise to limit the patent to a very short period—it impairs the establishment of industries. I have worked with industrialist for a good part of my life. They are not angels. They will establish industry only when they expect some profit.

Shri Braj Behari Mehrotra: When these patentees charge more higher price than the international price, is not the only remedy to impose restriction for 10 years for patents?

Prof. G. H. C. Bodenhausen: The remedy will be a law enabling Government to fix the ceiling of prices for all products, pharmaceutical products and also others. It will be a good solution, because if the patentee is not willing to meet that ceiling of the price, you give compulsory licences to Indian industry.

Shri Braj Behari Mehrotra: You are prepared to agree for patents of 16 years and 20 years. Will you not agree for 10 years when these high prices are charged in India for medicines in relation to prices of international market?

Prof. G. H. C. Bodenhausen: I can say that too short a period defeats the very purpose. It takes away the harm but it takes away the advantage also.

Shri B. T. Kulkarni: You said that this present Bill is an improvement on the U.K. provisions. I would like to know more about it.

Prof. G. H. C. Bodenhausen: It goes further than the UK Provisions. United Kingdom limits the examination of novelty to publications in England, which means that something which is not novel in another country say, France or Germany, still gets a patent in England, if it is new in England. You may obtain, a British patent for subjects for which you cannot obtain a patent elsewhere. It is a continuation of the old conception of the 17th century. It was difficult for the inventions from other countries to come to England over the English Channel. That was the reason. In your Bill it is said that the patent

cannot be granted when the subject is published wherever and whenever possible. It is a big improvement in my view. It is different in England. It is much better as proposed in your bill and you get better results. You get good patents that way.

Shri R. P. Sinha: So far as the duration of the patent is concerned, 10 years for the pharmaceutical and chemical products is too small a period. You said about that. You said that the investor or the entrepreneur will not be able to earn enough profits in this short period. Profitability in the industry is very high—in chemical industry, in pharmaceutical industry, etc. There is a study made by the Reserve Bank. We find that the return on the invested capital is very high. It is higher than the return in other countries . . .

Mr. Chairman: You may give the figures.

Shri R. P. Sinha: I have not got it. You accept this from me for the time being. I can give the figure later on. The profitability is very high. This is what has emerged out of the independent study made by the Reserve Bank of India. It is accepted by the American and other foreign investors. If that is the criterion what is the justification for patents for such a long period, when the entrepreneur is going to get that much from India in 10 years as he expects from the other countries in fourteen years or fifteen years?

Prof. G. H. C. Bodenhausen: There is relation between the degree of profitability and the necessary duration of a patent. If it is true, I accept your data without questioning, that in India profitability is much higher than some other countries, there will be a motive to limit the duration of a patent because the patentee will have earned enough in first few years. But at the same time, ten years will be too short. Certain chemical and other tests must be carried out. It will take some time even for the Government to give permission to make or sell the product. I think this might be true in India too. Even with higher profitability, what can you do when two years of the patent remain and then it becomes subject to free competition. I think ten years is unrealistic. If you say that there is high profitability, and it might be true, still the patent should last at least 14 years. Nobody will embark on exploitation when he has, after being given Government permission and after he has tested the invention, only two or three years to exploit it.

Shri R. P. Sinha: There are two types of cases: one, the inventions done here; and the other will be inventions done under foreign patents. They are usually put on the Patent Register after the product had been properly tested or tried in other countries. The period will start from the date when you file the complete specifications. We are told that it will take about two-three years for the grant of the patent. Probably the entrepreneur will start to establish his industry after this period. If we put it that the period should start from the period of the grant of the patent, will it serve your purpose and then will you agree to retain ten years without any change?

Prof. G. H. C. Bodenhausen: It makes it better. You give the protection the moment the patent starts. To start protection from the moment of the publication of the specification is illogical because you start protection at a moment when you do not have the patent. You have to wait for the grant of patent. Then only you can fight your competitors. If you say that it will start from the grant, it is better. I still hesitate to say that it should be ten years. It is not a sufficient period.

Shri R. P. Sinha: You get ten plus two.

Prof. G. H. C. Bodenhausen: Maybe ten years with extension. When a patent has reached the exploitation stage and when the patentee is not rewarded, there can be an extension of this period by five years. That is the position in some Latin American Countries.

Shri R. P. Sinha: You mean to say that where the Government find that it will be desirable to extend it, they should have power to extend the period upto five years.

Prof. G. H. C. Bodenhausen: It will be an improvement. Start protection from the grant and give power to the Government to extend the protection period.

Shri R. P. Sinha: Will that be more acceptable to you?

Prof. G. H. C. Bodenhausen: It will be more acceptable.

Shri R. P. Sinha: Would you tell me in how many countries does it start from the date of the filing of the full specifications and in how many countries it starts from the date of the grant and which is more popular?

Prof. G. H. C. Bodenhausen: I cannot exactly tell you. I think it is almost evenly divided. I am familiar with the Netherlands. There protection starts from the grant—it is 18 years from the grant.

Shri R. P. Sinha: The other point is regarding grant of patent of the product and the grant of the patent of the process. We have made that difference in our Bill. Do you think it is good to have the mixed system?

Prof. G. H. C. Bodenhausen: It is illogical to give protection both to the process and the product except in the case of chemical or pharmaceutical industry. I was a delegate at the Lisbon Conference for the revision of the Paris Convention about which there is a reference in the Ayyangar Report. It was discussed whether it should be compulsory under the Paris Union to protect chemical products, not only the process. It was not accepted—those for it and those against it almost being equal in number. But the modern trend is that it is better to give it for both. There is however, a technical difficulty. Your Bill extends this limitation not only to medicines but also to chemicals which may serve as intermediary products. At the date of the application or the date of the grant of the patent or even afterwards, some chemical products may become useful for medical processes. I think you should confine the limitation to pharmaceutical products as such and introduce also the onus of proof which appears in many legislations.

Mr. Chairman: I think your model law says one patent for one product, one process and one patent. Am I correct?

Prof. G. H. C. Bodenhausen: We have this onus of proof question when there is a new product by the patented process.

Mr. Chairman: By the same intermediary products you may derive two or three products and then you claim patent rights for all those products. But your model law says—one product, one process and one patent.

Prof G. H. C. Bodenhausen: It is not so. When you may obtain ten or more products through the same process, you can protect them all.

Mr. Chairman: Same intermediary products can be used for different products. That will be shutting out others.

Prof. G. H. C. Bodenhausen: I do not think that was the intention.

Shri R. P. Sinha: Don't you think it will be more in keeping with the modern trend that we have the process patented and not the products.

Prof. G. H. C. Bodenhausen: No, this is still an open question.

Shri R. P. Sinha: What is your experience in other countries about compulsory licence? Has it led to the industrialisation of the country or led to the putting up of the patented products manufactured in those countries? What is your experience in other countries?

Prof. G. H. C. Bodenhausen: I cannot give figures. The only thing I know is that the granting of compulsory licence is comparatively rare. It does not happen frequently.

Shri R. P. Sinha: The patentees themselves would like sometimes to have the products manufactured in different countries provided there is market for them.

Prof. G. H. C. Bodenhausen: I think the clause of compulsory licence works indirectly by encouraging contractual licences.

Shri R. P. Sinha: We are concerned with the results. If the industrialisation takes place, we will succeed. Does it lead to industrialisation?

Prof. G. H. C. Bodenhausen: I believe it does.

Shri V. B. Gandhi: As you have seen the provisions of this Bill, we have been rather anxious to see that the patent holders are not allowed to charge too high prices for their products. You have suggested as one of the possible remedies some kind of price control. Do you know of any country where such a price control has been instituted and it has been working with some success?

Prof. G. H. C. Bodenhausen: After the last war, nearly all the countries of Europe adopted some system of price control and I think it worked comparatively well. Of course there also some loopholes can exist. But it is better than the drastic remedies proposed in this Bill.

Shri V. B. Gandhi: Do you suggest that provisions for price control could be incorporated in this Bill?

Prof. G. H. C. Bodenhausen: Yes.

Shri V. B. Gandhi: In that case, the incentives to the patent holders which he gets as a result of the monopoly element will be absent or will be to some extent reduced.

Prof. G. H. C. Bodenhausen: You have to strike a balance somewhere. If the prices are too high, then you have to provide measures for lowering prices trying at the same time to keep the incentives to the patentee at least to some extent.

Shri V. B. Gandhi: I want to know from you whether it will be feasible for the Government to consider all the elements before controlling the price, such as the expenditure which the patent holder may have met in arriving at the patent, the publicity expenditure etc. Then it should be ensured that the controlled price should also give some incentives to him.

Prof. G. H. C. Bodenhausen: The Board which advises the Government regarding fixation of ceiling price can hear the patentees individually and then it will be possible to arrive at a satisfactory price both ways.

Shri Himmatsingka: You stated that because of the wide powers taken by the Government under the provisions of this Bill, it will frighten away persons who want to have patents in this country. As regards the compulsory right, you say that if the royalty is fixed it will act as a disincentive. Would you be satisfied if the limit of 4 per cent is not fixed and the right is given to the Controller to fix the amounting according to the circumstances of each case?

Prof. G. H. C. Bodenhausen: That would be an improvement. It is unfair to fix 4 per cent. There might be cases where 4 per cent may be too high when the product is cheap and

sold in good quantity; 1 per cent may be a satisfactory rate in such a case. Where it is very expensive to make a product, 4 per cent royalty will not satisfy.

Shri Himatsingka: Would you agree with the suggestion that the period begins to run from the date the patent is granted and not from the date of application . . .

Mr. Chairman: From the date of specification, not application.

Shri Himatsingka: Yes, from the date of specification.

Prof. G. H. C. Bodenhausen: That would be an improvement.

Mr. Chairman: He has agreed to that.

Prof. G. H. C. Bodenhausen: Yes.

Shri Himatsingka: In that case, what would be the protection in the interim period, *i.e.* from the date of specification to the date the patent is granted?

Prof. G. H. C. Bodenhausen: Under some legislations there is a stipulation that you can claim damages after grant of the patent even for the period before grant but after submission of the specification.

Shri Himatsingka: If there is a provision limiting the powers of the Government to use patents for its own purposes, will that satisfy the prospective patentees?

Prof. G. H. C. Bodenhausen: It would be an improvement. If you limit it to the extent as in the U.K. law, it would be less dangerous. Basically I don't agree with the whole idea of free use by the Government. When the Government wants to use patents, they can take a licence like anybody else. There can be compulsory licence under which royalty can be given. In Germany, Austria Switzerland, Scandinavian countries, Japan, and also in the USA when the Government wants to use the invention, it applies for a licence.

Shri Kashi Ram Gupta: You have just mentioned that the Patent Law of the U.K. is a weak one while the Patent Law of Japan is stronger. Please explain it in detail as to how one law is weak and the other is stronger.

Prof. G. H. C. Bodenhausen: There is no revocation of patents under the Japanese system, while there is revocation under the English system. This revocation is an important thing for a patentee. It seems that the idea of this Bill and also of the Report of Justice Ayyanger is that there is advantage in doing away with patents, so that it is better to have revocation. However when you revoke a patent, you get to the situation where there will be no industry; nobody will be prepared to risk on exploitation of the invention. There will be more importation. That is why the Japanese have done away with revocation. The second difference is that the compulsory licence clauses are much narrower in Japan. There one can get a compulsory licence—I have got a book here on Japanese law—only when the patent has not been worked and when it is particularly in public interest.

Shri Kashi Ram Gupta: May I say that the Japanese law when compared to our present Bill in so far as the compulsory licence system is concerned, is more or less similar?

Prof. G. H. C. Bodenhausen: It is very dissimilar.

Shri Kashi Ram Gupta: In India there is a section of the pharmaceutical industry which is of the opinion and which has represented that there should be no patent law for drugs or if at all there should be one, it should be the present Bill enacted in the present form.

Prof. G. H. C. Bodenhausen: I think the Bill admits patentability for processes but not for substances in the pharmaceutical field.

Mr. Chairman: It is for us to decide.

Shri Kashi Ram Gupta: I want to know whether he has studied this aspect. That is my point. There is a section of the Pharmaceutical industry which has represented that there should be no patent law and if there has to be one, the present Bill will suffice.

Mr. Chairman: What is good for our industry—that is for us to decide.

Shri Kashi Ram Gupta: He has also given it to us.

Mr. Chairman: He has made certain general observations.

Shri Kashi Ram Gupta: In view of those observations, is this a fact?

Prof. G. H. C. Bodenhausen: The Indian Pharmaceutical Industry also tried to give me information but I do not want to be identified with their point of view.

Shri Kashi Ram Gupta: So far the pharmaceutical industry works in an organized way and the industry mostly has got its own research laboratories. Generally this research is a part of their annual budget and this is allowed as revenue expenditure under the Income Tax Law. Therefore, when you say that the industry may not be able to recover the money, when that expense has been allowed yearly and so after 8 or 10 years they become successful. Naturally it is not accepted on mathematical grounds to take out that expenditure on which income tax has been allowed. Therefore, that reasoning does not hold good these days. In view of this can we hold that this 10 years after the sanction of the licence as a reasonable period will suffice?

Prof. G. H. C. Bodenhausen: I still believe that the 10 year period is a misjudgment of the situation.

Shri Kashi Ram Gupta: My point is that the research expenditure is allowed as revenue expenditure and income tax rebate is given on that. Therefore, that burden is not there and we have to fix the period in relation to that.

Prof. G. H. C. Bodenhausen: There may be cases where 10 year period is enough and there may even be cases where even 5 years will be enough. But as a rule 10 years is unrealistic.

Shri Kashi Ram Gupta: The question is: the period is related to the amount of expenditure involved. Nowadays that changes vastly.

Prof. G. H. C. Bodenhausen: The patentee may have an invention now which yields enormous profits but which he found after enormous research. He tries money methods or products and only one succeeds.

Shri Kashi Ram Gupta: Can you give the example of any patent law of any developing country which has got similar conditions as India and which differs very much from the Indian law or which does not differ very much from the Indian law?

Prof. G. H. C. Bodenhausen: I do not know any developing country whose patent law resembles your Patent Bill. Your Bill goes much farther in limiting patent rights and allowing exceptions.

Shri Kashi Ram Gupta: Is there any law which resembles our law?

Prof G. H. C. Bodenhausen: There is no law I know of.

Shri Kashi Ram Gupta: My last point is: can you give any suggestion for improvement of the Bill in so far as the question of fixing the period

Shri Sham Lal Saraf: Italy has no patent law for pharmaceuticals, chemicals and drugs. In our country we do have such voices that there is no necessity of having patent law. Please tell us whether this state of affairs has fared well in Italy.

Prof. G. H. C. Bodenhausen: Italy will shortly create patents for pharmaceutical processes.

Shri Sham Lal Saraf: Is it due to the reason that the drugs which they manufactured and sent out were fond to be defective?

Prof. G. H. C. Bodenhausen: I believe they had many quality troubles when competition, completely free.

Shri Sham Lal Saraf: U. K. law is softer. Japanese law is harder. Is it due to more checking or what?

Prof. G. H. C. Bodenhausen: When you call U.K. law weak and Japanese law strong, I would say your Bill is much weaker.

Shri Sham Lal Saraf: What do you mean by that? From what aspect particularly will you say that the Japanese law is harder?

Prof. G. H. C. Bodenhausen: There are few exceptions to the rights of the patentee, few compulsory licences and there is no revocation and no automatic fixation of royalties. It gives the essential protection to the national economy. But it is not spelt out in so many exceptions in the Bill.

Shri Sham Lal Sarf: Instances have come to light where ridiculous prices have been charged for pharmaceuticals and medicines. In certain cases prices have been 300 to 400 per cent higher than those charged for these medicines by foreign manufacturers elsewhere. Keeping that in view would you suggest that Government should have right or authority for importing such drugs and paying certain percentage of commission to the patentees registered in the country?

Prof. G. H. C. Bodenhausen: Under the Bill your Government would have the right of royalty-free importation of medicines. This is authorised by clause 48. This is too much. The system we have proposed in the Model law is quite different. It is compulsory licence with the possibility for the Government to declare certain classes of products for which licence can be given forthwith and also for importation of course against payment. But courts should fix the payment.

Shri Sham Lal Saraf: So the point is agreed upon that Government should have that right.

Prof. G. H. C. Bodenhausen: It is a matter of procedure. The procedure should be different. In your Bill exceptions are so strong and so numerous that the incentive for the investor completely disappears. We have tried in our Model law to keep that incentive.

Shri Sham Lal Saraf: Then I come to the point with regard to process and product. Would you suggest that in certain specifications the process also should be registered and in certain cases only the end product?

Prof. G. H. C. Bodenhausen: Yes.

Shri Sham Lal Saraf: Where the licence-holder or the patentee feels that he is harmed by the actions taken by the Government under the law, he can prefer an appeal. In this Bill it is suggested that such appeals may lie to the Executive. But ycu recommend that appeals should lie to the judicial authority. May I know what is the main plank on which you base this argument?

Prof. G. H. C. Bodenhausen: It is a matter of confidence. When you induce the industry to invest and when you have compulsory licence, appeal to the Government is not proper. You need a court for that. But it is very important to have the court procedure accelerated.

Shri Sham Lal Saraf: At the time of cancellation of certain data or revoking the licence or somebody placing a different process, at that time in order to prove that it is an improved process than what is patented for, the burden of proof should be on the new person?

Prof. G. H. C. Bodenhausen: Yes.

Shri Dahyabhai Patel: With your permission, I would request the witness to elucidate what he said about UAR. I could not quite follow that. Is their patent law similar to the law that exists here or is it a little harder or looser? What is the reason why they have been able to build up their industry? I can give you the background of my question. In this country, particularly in the matter of drugs and medicines, we had a very old system. The world has taken quite a lot of medicines which are known in this country though they are not perhaps practised in this country in the most modern scientific manner for lack of research. Still some of them have stood the test of time and some of the drugs that are known in the Ayurveda and Unani systems are very potent and effective. Why is it that we have not been able to develop these medicines? Is it because of this that some feel that a Bill of this kind is necessary for us?

Prof. G. H. C. Bodenhausen: With regard to UAR, I am not absolutely sure. I believe that UAR has a patent law which grants protection for both process and product in the pharmaceutical field. With that patent system, they have achieved some progress in the pharmaceutical field.

Your second question was about so many drugs which have not been developed in India. These things do take time. You have already a pharmaceutical industry in India which is now very much concerned with this Bill. Sooner or later research will more be developed. All these things take time—to train the people, to encourage the inventive spirit, etc.

Shri P. S. Naskar: I think we have come to the last lap of this questioning. I see in this booklet it is written—United International Bureaux for the Protection of Intellectual Property. Do I take it that this intellectual property belongs to the inventor? Or, does it belong to some commercial firm who utilises that intellectual property for commercial purposes?

Prof. G. H. C. Bodenhausen: It depends on the national patent law. In many cases the inventor works for a firm in which he tries to invent. When he fulfils that obligation, the invention goes to the enterprise. The patent will go to the enterprise.

Shri P. S. Naskar: You said about investment and patentees. I have not heard anything from you about the individuals who invent. It is necessary to give them protection. Do you think in that context that the patent encourages invention especially in drugs?

Prof. G. H. C. Bodenhausen: If the inventor works for himself, he will get the patent without any difficulty for himself. If he works in any firm, he is working and trying to make inventions because when the firm makes profits he will also be provided for; he will get a higher reward; he will get bonus and also a part of the profit which the enterprise gains from his inventions.

Shri P. S. Naskar: You know that most of the life-saving drugs have

been invented in public laboratories which have no profit-making motive, life-saving drugs like insulin, sulpha drugs, etc.

Prof. G. H. C. Bodenhausen: I may be wrong, but I believe the laboratories of pharmaceutical firms also have inventions to their credit.

Shri P. S. Naskar: India is a developing country. Industrially we are trying to develop technological know-how, etc. But the research has not developed to the extent comparable to other industrially developed countries. Now the patent system as it exists today is detrimental to the national interests of India.

Prof. G. H. C. Bodenhausen: No. I think the patent system is a favourable system almost in any country. It provides incentives for investment in an industry. Of course, in the beginning stages of development it will be partly to the advantage of foreign enterprises. The other day I was talking to the Director of National Patent Office in Algeria. He was saying "we have to pass through that stage; we have to be patient and rely for a certain number of years to a certain extent on foreign inventions; but the Algerian inventions will follow soon after".

Shri P. S. Naskar: If that is so, why research is not being done in our country? Research is always done in their own country. After inventing it, the foreign companies come here and obtain the patent right for commercial purposes. How does it help the development of research in our country?

Prof. G. H. C. Bodenhausen: When you don't have a patent system, there will be no industrialisation at all.

Shri P. S. Naskar: They don't even take up research work in collaboration with our people.

Prof. G. H. C. Bodenhausen: Under the threat of compulsory licence they will do.

Shri P. S. Naskar: No such thing is being done by foreign pharmaceutical industries. Only the patent is taken out so that others are blocked. Hindustan Antibiotics had done a lot of research on tetracyclin, but the Pfizer firm came and held up the work on account of their patent. The whole project is held up now.

Prof. G. H. C. Bodenhausen: Why don't you insist on compulsory licence?

Shri P. S. Naskar: We want compulsory licence. That is why we want to amend the Bill. I would plead with you to understand our difficulties.

Prof. G. H. C. Bodenhausen: I know the tetracyclin case very well. By using your compulsory licensing system you would achieve better results. Even the best law cannot give you a solution when it is not used.

Shri P. S. Naskar: I find that your model law is quite suitable for newly independent countries as in the Continent of Africa where there is no existing patent office or industrial property office and they don't have a well-developed patent system. But we have a well-developed system, a patent office and also an industrial property office and everything. With this background, how does your model law help us?

Prof. G. H. C. Bodenhausen: I know that this Model law is of less use for you. Nevertheless, you can perhaps take out one or two stipulations which could fit into your system too.

Mr. Chairman: My friend referred to you about the foreign remittances. I will give you figures for the year 1956-57 and for 1962-63 in the shape of royalty remittances, technical service remittances, dividend remittances, etc.

	1956-57	1962-63
	(Rs. in millions)	
Roalty Remittances :		
Basic Industrial Chemicals . .	0.07	0.49
Pharmaceuticals	0.39	0.79
Other Chemicals	1.21	3.02
Technical Service Remittances :		
Basic Industrial Chemicals . .	0.11	2.13
Pharmceuticals	..	0.43
Other Chemicals	0.01	5.22
Dividend Remittances :		
Basic Industrial chemicals . .	..	3.24
Pharmaceuticals	0.54	9.96
Other Chemicals	..	7.25
Total remittances of all the above items	2.33	32.5

The prices charged have been nearly 3 to 4 times the international price in antibiotic drugs. You have said in the introduction to your model law that patent law is one of the factors that comes into operation in regard to the question of prices. That is true. But, with these things happening in our country, especially with our very large population and our people being very poor, don't you think that these restrictions for compulsory licence and licence of right are necessary in the interests of our public?

Prof. G. H. C. Bodenhausen: I don't pretend for a moment that the situation in India is satisfactory. I don't question your figures either. The question is whether you will be able to meet the situation with this patent Bill. I am sure that it will make it worse. You may find some temporary influence on the prices. But, as time passes, you will find that the prices will rise again because of the shortage of drugs; and people will not risk investment in India. Some other means should be found to influence the situation.

Mr. Chairman: One of the reasons you have given is that there is no right of judicial appeal. Would you be satisfied with a special Tribunal?

Prof. G. H. C. Bodenhausen: I am in favour of existing courts. Special tribunals are inclined to follow a different pattern.

Mr. Chairman: So you prefer judicial appeal. You also say that 4 per cent. royalty on food and chemicals is rather too small.

Prof. G. H. C. Bodenhausen: I don't say 'too small'. I say it is an arbitrary figure. It can be too high in some cases.

Mr. Chairman: So Government has drawn a *via media* and fixed it.

Prof. G. H. C. Bodenhausen: You cannot fix it once for all products.

Mr. Chairman: You would like it to be left to the parties?

Prof. G. H. C. Bodenhausen: In some cases it may be 1 per cent; and in some it may be 15 per cent. Both may be justified.

Mr. Chairman: So you would leave it to the parties to come to some agreement.

Another objection you raised is that the Government cannot import medicines royalty-free and you want royalty to be paid.

Prof. G. H. C. Bodenhausen: I think the proposed system will hamper industrialisation.

Mr. Chairman: If it is done ir the interests of the public?

Prof. G. H. C. Bodenhausen: It depends where the interests of the public lie: 'no industrialisation and free importation'—is this in the public interest?

Mr. Chairman: Government hospitals are in the interests of the public. Some Governments have this power.

Prof. G. H. C. Bodenhausen: There is Sec. 48. I do not know of any parallel to that.

Mr. Chairman: After all Patent law is in the interests of the country where the law is made. It should be in all interests. You agree to that in your introduction.

Prof. G. H. C. Bodenhausen: Only I said that today it may be good for India, but not for ever.

Mr. Chairman: The country's industrial development and the stage of development, richness or poverty of the population—all these things had to be taken into consideration in enacting this law. You agree with that?

Prof. G. H. C. Bodenhausen: Of course, yes.

Shri R. Ramanathan Chettiar: In regard to the figures you quoted it will be better if I also add this....

Mr. Chairman: He does not dispute the figures.

Shri R. Ramanathan Chettiar: In 1962-63—Page 1387 of the Reserve Bank Annual Bulletin, November 1964—Pharmaceutical Industry: investment—Rs. 14 crores; Dividends remitted—2 crores and the royalties etc., Rs. 5 crores. So Rs. 7 crores was the profit on an investment of Rs. 14 crores and most of it is owned by foreigners in this country. Don't you think this is unconscionable?

Prof. G. H. C. Bodenhausen: I do not contest the figures.

Shri R. Ramanathan Chettiar: Mr. Chairman was referring to comparative figures—1956-57 and the present time. Does he know this fact that fictitious profits are made by the Indian pharmaceutical industry under the present Patent Law. That abuse we want to put down. Naturally we want to tighten up the law. The more the number of years we give the more are the chances for the pharmaceutical interests to make more money and also establish cartels and monopolies.

Prof. G. H. C. Bodenhausen: Again I revert to my theme—whether the purpose is to kill only the tiger or all the animals?

Mr. Chairman: The main object of the Patent law is that research should be carried on in India and the manufacture should be done in India. But most of the Indian patentees import some intermediary from outside and finalise the product and label and sell it and make huge profits. Our Bill is designed to prevent such abuses. In the circumstances you have no objection to the provisions of compulsory licensing and licence of right that has been incorporated in the Bill?

Prof. G. H. C. Bodenhausen: I think they go too far. I don't object to the principle. That is necessary.

Shri R. Ramanathan Chettiar: Every other Patent law has such a provision.

Mr. Chairman: And your model law too. Then what is your objection for these provisions?

Prof. G. H. C. Bodenhausen: They go too far in many respects. First of all the compulsory licences are given without appeal to a court. That is one point that may be corrected. Licence of right particularly for pharmaceuticals is automatic.

Mr. Chairman: Naturally before granting a licence of right or compulsory licence Government makes an

investigation. The Drugs Controller makes an investigation and grants the licence after hearing the parties.

Prof. G. H. C. Bodenhausen: He is after all human. He can make errors too.

Mr. Chairman: So you want a right of appeal?

Prof. G. H. C. Bodenhausen: I think it is better to leave the final decision to the Judiciary.

Mr. Chairman: Thank you very much.

(The witness then withdrew).

(The Committee then adjourned).

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Friday, the 1st July, 1966 at 09.30 hours.

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESS EXAMINED

National Foreign Trade Council Inc. 10, Rockefeller, Plaza, New York.

Spokesman

Mr Leonard J. Robbins.

National Foreign Trade Council Rockefeller, Plaza, New York.

Spokesman

Mr. Leonard J. Robbins

(The witness was called in and he took his seat)

Mr. Chairman: Mr. Robbins, whatever evidence you give here is public; it will be printed and distributed to the Members of this Committee as well as to all other Members of Parliament. If you want anything to be treated as confidential, even that may be distributed to the Members.

We have received your memorandum and also the latest statement you gave us last night. That has also been sent to the Members. Probably they had no time to go through it. If you want anything to be stressed upon, you can do so now. Please give us a short resume of the notes that you have submitted.

Mr. L. J. Robbins: Mr. Chairman and Members of this hon. Joint Committee, I should first like to apologize to you for presenting this typed Statement at such short notice before my appearance here, but there is a reason which I hope you will appreciate. When it was initially proposed, at the end of the last year that the American National Foreign Trade Council should request permission for me to appear before you, we were not at that time very familiar with the precise procedure of this Committee. As you know, we only presented a very brief and very generalized statement as to what our ideas were about this Bill. Also, I expected to be called in January or February and just make a verbal statement at rather short notice. In view of the subsequent postponement after the initial hearings, I was not certain whether I would be able to come, owing to other commitments, but there was time for me to prepare a written Statement possibly to be used as a substitute for personal appearnace.

I should like to say that the National Foreign Trade Council gave me a very free hand. However, this text has been studied and reviewed by various committees and you will appreciate that there are various changes made. But I can say that this Statement

does represent a concensus of the American view point.

I do not propose to read this statement straight through, but I would like to emphasize certain points and elaborate on others. Also, during recent months, I have been able to collect a number of documents which I believe are significant, and which I hope you will find of interest, I have them here, and with your permission, I will refer to certain of these documents which I believe are of significance in connection with each of the sections of my Statement, and I will draw attention to certain passages. I propose to leave these documents with you, arranged in order, together with an index, for the Committee's records.

Those of you who may have read through the Statement will realise that certain sections are rather different from each other and have different approaches. Do you wish to put questions right at the end or do you wish to put them after each section?

Mr. Chairman: You may complete your statement; the questions will come afterwards.

Mr. L. J. Robbins: Very Well. I now come to the introduction. In the first paragraph. I naturally refer to my sponsorship by the American National Foreign Trade Council. I have here a report for the year 1963, and a program of the last annual convention and declaration of principles which indicate the vital interests of American business in international co-operation and the relevance of patent protection in this connection. There is a section in the declaration of principles relating to patent problems generally. I have been informed that 35 members of the Council—well known US Corporations—have actual manufacturing operations themselves in India in many fields. Some 20 have licensing and technical assistance arrangements with Indian firms and over 30 have extensive trade and service connections. I need hardly say that I am greatly honoured by your invitation to apear before you, and I earnestly hope that the submissions that I make at this Hearing and the answers to questions you may put to me—based on some 35 years' experience in this field—will be of assistance to you in your deliberations on the Patents Bill of 1965.

I am here before you as an expert in the international patent field. I hope I can furnish any information you require concerning the past and the present patent laws and practices in all countries throughout the world. I can discuss the licensing of patents from the viewpoint of a lawyer who is naturally interested in obtaining the best terms for his clients. I feel sure you will understand that I do not have any expert knowledge in connection with the prices to the public of patented articles and materials. I merely become a member of the public in this area. I may buy something which is useful, but I may complain about prices from time to time, like everyone else.

However, in view of want I will say subsequently, I can venture the following two generalisations on a purely personal basis of conviction: (1) that patent monopolies and royalties based thereon play only a minor part in the price structure of the competitive market place and (2) that any special situations or temporary dislocations in India or any other country should be dealt with by appropriate and flexible regulations or decrees and not by imposing arbitrary restraints on the sensitive and unique operations of the patent system.

In view of the importance of patents in promoting technological development and the resulting effect on international relations, any changes in patent laws anywhere in the world are of major interest, and are followed closely, certainly in the United States and in Europe and elsewhere. However—this is something which I would like to emphasise—in all my experience, this is the first time that

so spontaneous a reaction has occurred and that business organisations from so many countries—from the United States, from Europe and from Japan—have requested permission to send representatives or to submit their views in writing to a Parliamentary Committee of a Sovereign State in connection with patent legislation. It is clear that the significance and implications of Patents Bill, 1965 extend far beyond the borders of India.

My own experience totally convinces me that a sound and generous patent system, with fair and reasonable safeguards of the public interest, is absolutely essential for the future growth of any country, whatever its status in the present industrial hierarchy. Please permit me to quote what can be regarded as unsolicited testimonials from three of America's greatest Presidents:—

Over 150 years ago, Thomas Jefferson, who was an inventor himself, said:

> "The issue of patents for new discoveries has given a spring to invention beyond my conception."

Abraham Lincoln, also an inventor, said:

> "The Patent System added the fuel of interest to the fire of genius."

30 years ago, Franklin D. Roosevelt said:

> "The American Patent System has promoted countless applications of the arts and sciences to the needs and well-being of our people."

This is undoubtedly a very technical field. At this point, I should like to set out a few basic propositions which apply in India, even at the risk of stating what is familiar to you:

(i) Inventions must be distinguished from patentable inventions. Inventions have been made and remade from the dawn of history. The wheel was orginally a patentable invention, if there had then been any patent law. Patentable inventions involve the modern legal concepts developed during the 19th century, of novelty, utility, inventive height, etc.

(ii) The best invention in the world can be ruined by an incompetent patent attorney. The protection against infringers afforded by a patent depends on the scope of its disclosure and the wording of its claims.

(iii) Patents are not things but legal concepts. They cannot all be treated alike by arbitrary rules.

(iv) The very rare pioneer patents create new industries. If they are not adequately worked by the patent owner, third parties can come in through compulsory licensing. Most patents are improvements which may or may not be of interest to competitors. Patents relating to unsuccessful inventions can be ignored; they are merely pieces of paper.

(v) Apart from the USA, West Germany and Japan, the majority of national patents are owned by foreigners. This, of course, is true in India. Why is this? The answer is very simple. The owner of a new invention must essentially be a gambler. It is something like putting on a new play in the theatre. It will be a success or a failure, but you do not know in advance. When a patent application has been filed in the inventor's home country, he must decide promptly whether to file abroad, even though he is still not certain that the invention will be profitable. The International Convention gives him a year. But in India, which does not yet belong to the Convention, any publicity or use in India would destroy the validity of patent rights. Therefore, many patents are obtained in India by foreigners purely as speculations. If they are not successful, they remain paper patents doing no harm and probably abandoned. If

they are useful and are not manufactured in India, then Indians already have the recourse of compulsory licensing, if they wish, under the present law.

I am aware that the Patents Bill, 1965 has been under preparation for several years past, and I do know something about the previous history of this whole proposal. The Bill, of course, demonstrates legal scholarship and sophistication. But in operation its practical effect would inevitably be to restrict, reduce and circumscribe the rights and activities of patentees in India—Indians as well as foreigners.

As a result, if Patents Bill, 1965 should be enacted into law, this law would be unique and far more drastic in overall effect than the patent law of any other country operating under free enterprise conditions, and would, I believe, have a detrimental effect on the Indian economy.

Those of you who have had an opportunity to glance through my Statement will see that I have arranged it in sections and proceeded from the specific to the general. I have included what I believe will be of interest to you including a special section on the U.S. Kefauver investigation.

I start with section 2 which deals with some specific provisions of the Bill. I am aware that a number of detailed and comprehensive analyses of the provisions of the Bill have already been prepared and will be submitted or have already been submitted by various Indian and foreign organisations. I wish to avoid any unnecessary repetition. So, I will only refer to just a few sections of the Bill which based on my own experience would be either ineffective as regards their avowed purpose or would be positively harmful to Indian interests.

Coming to product and process claims, (Chapter II, Clause 5) clause 5 attempts to define certain technical fields in which independent product claims will not be allowed, but only process claims. I consider this actually to be an example of wishful thinking. The apparent prohibition could in practice be easily circumvented by skillful patent attorneys with the cooperation of the inventors while the strict application of this clause would cause enormous difficulties of administration and interpretation in the Indian Patent Office and undoubtedly would result in delays in prosecution.

Such a process limitation, at any rate in the field of chemicals, including pharmaceuticals and foodstuffs, is a 19th century concept in Europe, which arose when technical knowledge and social ideas were very different. It has now become quite academic. In certain countries, such as Germany, Holland, Switzerland and the Scandinavian countries, where the patent laws still do not permit independent chemical product claims *per se*, in actual practice very broad process claims are permitted, even covering conventional reactions, if the product is new and has advantageous and unexpected properties. The emphasis in these countries even though on the surface they only protect process claims, is to protect the product and, of course, in all these countries process claims do automatically protect the immediate product of the process. I say that a broad process claim can be really equivalent to an independent product claim.

It is highly significant that in recent years Great Britain, Australia, New Zealand and France and still more recently Ireland and the new country of Algeria, have switched over to independent broad product patent protection for chemicals and pharmaceuticals. Almost everywhere on the basis of informed legal commentaries and contemplated legislation, this can be regarded as the modern trend to facilitate the work of examining Patent Offices and Courts. I am sure you know that there is a proposal for a European patent. This may never come through, but it was based on the latest thinking which definitely permits inde-

pendent product claims. The same is true in Scandinavia where a proposal for a uniform law is under consideration.

If the chemistry indicates possible alternative routes to obtain a new product, the alert and skilled patent attorney together with the inventor will conduct sufficient experiments in the beginning to justify a broad process claim which will bar infringers. Furthermore, if the product is successful, the patentee is likely to explore all the chemistry involved ahead of competitors and obtain further supplementary patents when advisable. Therefore, I consider there is no basic difference but only a matter of degree between a product patent and a process patent.

Chapter II, clause 5, of the proposed Bill goes far beyond the law of any other country in applying this illusive restriction to fields outside chemistry—namely, alloys, optical glass, semi-conductors and intermetallic compounds. I believe this indicates some lack of technical appreciation by the drafters of the Patent Bill. For example, for many alloys, the only process involved is mixing and heating the ingredients. The invention resides in the combination of ingredients. Thus, process and product claims are actually identical in effect.

I would also point out that the technical border lines of these terms 'alloys', 'optical glass' etc. are so vague that arguments with a Patent Examiner as to whether a given case does or does not fall within Chapter II, clause 5, could be very difficult. Thus, while it is doubtful whether the restriction of the patentee to process claims will produce the desired result, there can be no question that the Patent Office would have a most difficult and frustrating experience in administering this provision.

In the exhibit here I would refer you particularly to item 7 where I have selected some Germanpatents relating to alloys and optical glass. Germany at present, as you know, does not permit independent chemical product claims. However, these two patents, which are typical, do have product claims. So, this clearly indicates that the highly skilled German . Patent Office does not regard alloys and optical glass as being result of chemical reactions. This is a most difficult field in the present knowledge of atomic and molecular structure and it would be most unfair to the Indian Patent Office to make it state that a given alloy or glass invention involves a chemical reaction or a physical mixture. The same applies to intermetallic compounds. So, I consider that the proposed restriction in this field is entirely artificial. For your general information as regards what I said about the effect of broad process claims I have in the Exhibits some examples of Indian patents which have already been granted with some extremely broad process claims which would in practice operate just as broadly as product claims. So, it is possible in India now under the present system to do this. I have a chart here prepared in my office to show just what the situation is as regards product and process claims in all countries throughout the world and that I think is the latest information in this field.

We now come to the sections relating to compulsory licensing and licences of rights—Chapter XVI, clauses 87, 88, 89, 95, 96, 97 etc. It is true that in the early years of the 19th century many countries provided for outright revocation of non-worked patents. This was finally considered unjust and impractical and compulsory licensing was proposed as a more equitable and less drastic alternative. The laws of most major countries now provide for compulsory licensing of patents in general (that is, the grant of licenses to approved applicants on suitable terms after Patent Office or Court investigation) after three years from grant, in conformity with the provisions of the International Convention. A few countries, such as

Great Britain, also provide for compulsory licensing of patents for drugs and foodstuffs without any period of delay after grant.

I think you know that the United States does not have any provision as regards working and compulsory licensing in the patent statute, but owing to the different approach in America as regards anti-trust measures and decisions of courts, it is probably true that more American patents are subject to compulsory licence than anywhere else in the world.

The history of statutory compulsory licensing since the beginning of the 20th century is highly significant. Very few compulsory licences have been applied for anywhere. The broad general explanation is that a successful invention is fully exploited by the patentee at a reasonable price to the public and that an unsuccessful invention dies. Intermediate situations are dealt with by voluntary licensing, as a much preferred alternative to the official intervention of compulsory licensing procedures.

At the present time, no country anywhere has fixed any ceiling for royalties under a compulsory licence, but leaves this to negotiation between the parties involved and the appointed authorities, with the right of appeal in the event of disputes. Inventors and industry, throughout the world, have lived and survived with the mild and consistent compulsory licensing provisions of countries which broadly adhere to the International Convention.

I would like to emphasize the next two statements on page 4. The provisions of Indian Patents Bill 1965 are so drastic in respect of compulsory licensing, in comparison with the laws of all other countries, that they are detrimental to Indian interests from every aspect.

Consider, for example, the situation of an American company originating a successful invention and have worldwide patent protection, including India, and willing to invest capital abroad to manufacture the product. It seems obvious that a manufacturing plant would not be established in India if the American company could be compelled to grant a low royalty licence to any and all competitors.

Also, and I would emphasize this, consider the situation of Indian industry itself—assuming, as everyone hopes, that this will expand and that domestic Indian research and development will become an important factor of the economy. Under the compulsory licensing provisions of the Bill an Indian company could in effect appropriate the inventions of its competitors, whether they were Indian or foreign. Indian industry, in certain fields, may not be concerned with this at the present moment, but in the future this could be most harmful to commercial initiative. Furthermore, the possibility of compulsory licences to import products would actually favour foreign over domestic Indian industry.

In connection with this brief statement on compulsory licensing I would very definitely refer you to these Exhibits particularly. There is a most interesting report prepared for the American Congress—the 85th Congress. It was entitled, "Compulsory Licensing of Patents under some non-American systems". This was prepared by a very well known Swedish lawyer who was intimately connected with the problem all over the world. I would draw your attention to the conclusion—the implication is that if you push too hard in this field, you may kill the goose that lays the golden eggs—

> "The dissatisfied inventor will pass over into the area of trade secrets, cease publishing the results of his intellectual research, which if known and available will be useful in further development, or simply stop inventing. Public interest in patent matters, there-

fore, can never neglect the interest of the new inventors without defeating its own purpose."

The very first proposal for compulsory licensing, surprisingly enough, was made in the United States. For the last 50 or 60 years there have been many, many proposals for compulsory licensing in America, but they have not succeeded because, as I said, there is a different viewpoint with regard to anti-Trust.

The Exhibits include a highly interesting list of reported cases on compulsory licensing in both Great Britain and Canada during the last six years and you will see how very few controversies and requests for licences have arisen in these very typical countries.

I have also included a copy of a recent decision in England, which may not be available to you, which denies compulsory licences for importation of a pharmaceutical product and I submit that this decision should be carefully studied. It is by a well known and a highly respected senior hearing officer in the British Patent Office and refers to the possible results of weakening the patent law by permitting importation of patented products from abroad.

I come now to the provisions about Government use of inventions, that is, Chapter VIII, Clause 48, Chapter XII, Clause 66, Chapter XVII etc. The laws of, I think, practically all countries, as in India at the present time, do provide for Government use of inventions for military purposes and in time of emergency. This is considered absolutely legitimate, but in recent years this relatively clearcut proposition has been complicated, it is true, by various countries in which there is socialised medical legislation. In Great Britain, the House of Lords, in a very important decision only last year, did construe the British Patents Act to enable the Government, in the operation of the National Health Scheme, to make unlicensed use of imported patented products, of course subject to compensation. However, in spite of this decision, I am reliably informed that the British Ministry of Health has elected not to import any more but has preferred to resume obtaining its medical supplies from local production. There are a number of reasons for this decision by the British authorities. Partly it involves the question of keeping up the quality of the product. When there is an imported product, it may not be possible to control the vitally necessary quality of the product. I will come to this question of importation later.

The powers granted to the Indian Government in the Patents Bill 1965 are so sweeping, particularly in connection with clauses 48 and 102, that it is quite unlikely that any foreign owner of an important invention would actually apply for patent protection in India at all. It seems much more likely that any operation in India, either by direct investment or by a licensing arrangement, would be based on secret know-how. I would point out that secret know-how would be outside the provisions of the patent law. Of course, these days anything based on secrecy is to be deplored. It is unscientific and it does not benefit the public.

The next of these comments is on special provisions involving examination in the Patent Office, that is, Chapter III, Clause 8 and Chapter IV, Clause 13. An applicant is expected, under the provisions of this Bill, to furnish particulars of all other corresponding foreign applications. I would point out that at the present time—and, of course, probably for some time in the future—the preponderance of applications will be owned by foreigners. There are well over 100 countries having patent laws and many important inventions are widely filed. In view of international trade that is now becoming essential. I can assure you that it would be a clerical task of most appalling proportions for a busy patent department of a large corporation, say,

in the United States or in Europe, handling thousands of pending patent applications all over the world, to compile the information called for under Clause 8 and forward it to India within eight weeks.

I would point out it is quite uncertain what the Indian Patent Office would then do. Clause 8(2) is permissive. The Controller may call for particulars of prosecution of any or all other foreign applications. But foreign examination practices, and novelty and patentability requirements, are extremely variable and in many countries quite different from those of the Indian Patent Office. For example, the average official action in the United States or Germany would result in arguments and amendments based on legal principles not present in the Indian Patent Law. Also in many foreign Patent Offices it may take several years before even a first official action is issued. If the Indian Patent Office invoked Clause 8(2), it would receive an erratic flood of material which it would find either difficult or impossible to digest.

If you will refer to page 5, I refer specifically to the situation now in Canada and also in various other Scandinavian countries and Holland. In the Exhibits I have some examples of what they do require. But I would emphasize that in these countries, the requirement of furnishing information is permissive and voluntary. Some applicants may occasionally furnish information if it is convenient to them. There is absolutely no penalty in any of these countries for not furnishing information of what is done elsewhere.

Clause 13, Chapter IV, provides for a novelty search of publications not only in India but elsewhere also, that is, throughout the world. I submit the Indian Patent Office has no library facilities for such searching. Even in Great Britain the search is confined to domestic publications. It is only a very few highly industrialised countries that provide for world-wide novelty. It is also notorious that the quality of searching even in these countries is becoming very poor owing to the vast increase of the technical literature in recent years.

I refer now very briefly to the Right of Appeal, Chapter XIX, Clause 116. This Bill positively and severely restricts the right of appeal from Patent Office decisions and decisions of the Central Government, to higher tribunals or to the Courts. I could say much more on this point but I do not feel that this is a matter on which outsiders should go very far. I consider this as a matter for the Indian legal profession. I may point out that about a year ago in Washington I had the honour of meeting a number of Indian Judges. I feel quite sure that if this restriction of the fundamental right of appeal is enacted into law, it ought to be a matter of very great concern for the legal profession and judiciary in India.

I would now like to refer in more detail to the general effect of a law based on this Bill on the future functioning of the Indian Patent Office. I consider this as most important from the practical viewpoint.

With your permission, I may point out that I visited the Indian Patent Office in Calcutta in 1953 and met many officials and members of the examining staff. I was greatly impressed by their dedication, hard work and, at that time, their concern about the efficient operation even under an increasing work load. A decade later, it is generally conceded that the Indian Patent Office, as it stands now under the present law, has serious difficulties in carrying out the relatively mild provisions of the existing patent law. I can state quite categorically that the Indian Patent Office, as it is at present constituted and organised, would not be able to administer a new patent law based on this Bill. This would be true even if the present number of patent applications filed per year does not increase. But, as you know, in all

other countries, the number of patent applications is increasing. There is no doubt that it will increase in India also. The efficient administration of clause 8 and clause 13, irrespective of all the other clauses, would call for a large number of highly skilled examiners, familiar with the patent laws and practice of other countries and at any rate conversant with several European languages to enable them to search the technical foreign literture. It would take many years to train such an elite examining crops. I ask: Is the personnel available? Apparently, many odd situations would arise. The Patent Office would have to compete for technically qualified manpower with the industry it is intended to serve—just at a tims when industrial expansion in India will produce a shortage.

Obviously, to carry out the potential requirements of the proposed new patent law, the Indian Government would have to budget for very substantial increases in staff and office space. Would this be justified? If even some of the submissions presented in the present statement, contentious as they may now appear, should turn out to be correct, there might actually be a decline in the number of patent applications filed by both Indians and foreigners, contrary to the normal trend.

Whatever the underlying objectives and reasons may be for the preparation of Patents Bill, 1965, I feel convinced that the legislature as a whole, irrespective of economic or social pressures which may be responsible for some of these provisions, is not yet aware of the purely practical problems the Indian Patent Office would face. There would be no point in enacting a law which could lead either to administrative chaos or to stagnation.

I can well understand that the officials of the Patent Office who are very devoted public officials, would have great hestitation, obviously, in criticising a Patent Bill, which might be regarded as serving their own interests. This problem of the Indian Patent Office can, I think, best be presented from the outside on the basis of a comparative evaluation of what is going on in other patent offices all over the world.

Now I come to Section 4, *i.e.*, the effect of this Bill in certain specialized technical fields. This Bill, of course, would affect patent rights in general but would have very special impact in certain technical fields in which very intensive research is essential for progress, unless human nature in India has become entirely altruistic. These fields include, of course, pharmaceuticals and foodstuffs in particular. All governments throughout the world are concerned with public health and availability of essential drugs and foodstuffs, but the basic issues are the same in all countries, whatever their size, population and the stage of industrial development.

Possibly the drafters of this Bill hope that the result of their efforts will be to provide freedom of action to the public and private sectors of the Indian Pharmaceutical Industry to furnish drugs and foodstuffs to the Indian public at the lowest possible prices. But, I say, gentlemen, that there are no valid and rational arguments that would indicate fulfilment of such a hope. It is far more likely that foreign applicants, now responsible for over 80 per cent of the Indian applications, would gradually find the restrictions too difficult, too onerous, in this highly difficult and technical field and might even bypass India entirely and refrain from filing on new inventions in this field. At the present stage of Indian domestic research, this means that Indian manufacturers might actually have to appropriate and use inventions made abroad which are the legitimate property of others.

I respectfully submit that this Committee should most carefully consider the Italian pharmaceutical situation in all its aspects. I am sure you are aware of it in general, but there are

many particular aspects that are not so well known. It is, of course, a unique situation that the Italians do not grant any type of patents for pharmaceuticals. I will not now explain the reason why this has occurred, but let us treat it as a fact. After the War, the Italian industry did indeed copy many important drugs originating in the United States and Europe. The theory, of course, was that the Italian industry had been so much damaged by the War that this was the only way they could keep the industry going. The industry became quite competent and aided by the publications of foreign inventions did begin to develop its own knowhow. I have referred here in the Exhibits to a situation that you may be aware of that certain Italian firms, in recent years, not only copied but actually stole technical information and even physical organisms that were used in producing antibiotics.

The fact that there are no patents granted on pharmaceuticals in Italy has not led to any great benefit to the Italian public. I can assure you that the prices of pharmaceuticals in Italy are at least as high as, if not higher than, those in other countries and for any given drug, there may be 20 or 30 different products on the market, all under different names, so that the emphasis is on advertising. Owing to the great cost of advertising, each of these 20 or 30 companies fight one another. It has become, I can only say, a ridiculous situation and that is now apparent to the Italian pharmaceutical industry and partly as a result of this and partly due to the Italian entry into the Common Market, it is highly probable that the Italians will enact a pharmaceutical patent law comparable to that in other countries. In other words, having been in a unique situation for many years, Italy may now join with the rest of the world in handling pharmaceutical inventions.

You are, of course, aware that, during the last generation, a medical resolution has occurred particularly owing to the discovery of sulfa drugs and antibiotics. But in countries having strong patent systems, competition has actually been intense due to the stimulation of research. If in certain instances and at certain times, costs to the patient may appear to be high, this is not due to the existence of patents, but to research costs. Alleged unsatisfactory or inappropriate commercial practices in any country should be controlled by government by suitable regulations.

I would again say that the patent system is not the correct system to apply restrictions against commercial practices. I say that this is true in India and I say that the Legislature should look forward into the future and not consider merely the present situation and I would emphasize that the nature of medical research is changing very rapidly everywhere. A great deal is being conducted by Universities and Foundations, intimately tied up with biology, physics, chemistry and what is known as the group of "life sciences"; there is pure research and there is applied research. Startling discoveries will undoubtedly be made, which will become available to everybody. The initial patent protection is the price you must necessarily pay to encourage this research. It is only of limited duration and after that, the results of these discoveries will be available to all mankind permanently without any patents being involved.

The next Section, on the Kefauver investigation, I believe, will be considered by you as of considerable importance because there has been so much of misunderstanding about the Kefauver investigation. Senator Kefauver, many years ago, started an investigation through his sub-committee of the Judiciary Committee to investigate what he called "administered prices", *i.e.*, prices he did not consider the result of the natural operation of commercial market conditions. He first of all investigated automobile

industry prices; he then investigated the baking industry and then some other industries. It was, more or less by accident that he finally got down to investigate the pharmaceutical industry. Before going into this discussion, I want to point out the result. I am sure you will understand that, since Senator Kefauver was the Chairman of his Sub-Committee, his political Party was in power. After years of investigation—I think you have the full Kefauver Committee Report available—his own Party disagreed with him. The net result on the patent laws of America was absolutely negligible and the practical result was nothing. Senator Kefauver tried to do in a way what this Indian Patent Bill is aiming at—I would not say wholly because American law is different—but he was trying to use the patent law to control prices of drugs. As I said, the net result was zero. The main result of Kefauver's investigation was in an entirely different field which the pharmaceutical industry in America welcomed. That was somewhat stricter investigation of the quality of drugs and of their effect, because most of the manufacturers in America felt that this was a way of keeping the marginal producers in this highly competitive field in line. So, I would just emphasize—I will not go into all the details—that the net result of the whole Kefauver Investigation was that the Patent Law itself was merely modified in completely negligible directions and there was no restriction on the terms of patents and no restriction on licence royalties. Whatever they were, his proposals were considered totally impracticable. I am sure that many of you will read what I have written here at the beginning of page 8.

I will, if I may, just read from the last paragraph. 'After extensive hearing the Kefauver Sub-committee Report was issued on June 27, 1961.' If you will read it carefully, you will also see that 'it bears every evidence of the most hurried preparation and very crude distortion of facts.' I would point out that Senator Kefauver, though I am sure his basic ideas were to protect the public interest, was a politician with presidential ambitions. He was a very, very skilful publicist and much of his sensational statements, many of them totally wrong, were, released early in the afternoon so that they would just catch the afternoon newspapers and make very large headlines. "Few people seem to know that there was a very vigorous minority report by Senators Dirksen and Hruska which begins with the words "The majority's views in the report on administered prices in drugs do little credit to the Subcommittee for there is no attempt whatsoever to be objective and constructive through judicious evaluation of all the testimony and exhibits'. It also states 'There has been a general confusion on the subject of patents, which pervades the majority's report on process patents versus product patents'. I can personally testify to this because the Kefauver Report has quoted a single paragraph from a very innocuous informational article I had written many years ago entitled 'Pharmaceutical Patents in Foreign Countries' to imply that certain countries do not grant patents for new pharmaceutical products. However, the Dirksen Minority Report points out:

> 'Any careful review of the comments made in the majority's report as contrasted with the text shown above indicated that there is a completely different concept of patent protection abroad than the report attempts to convey.'

Then they refer to subsequent statements I made that record exactly the opposite impression.

Shri R. P. Sinha: You were responsible for providing that motive.

Mr. L. J. Robbins: I was not responsible. Senator Dirksen picked it up himself. This was a very old paper I had written. They found it themselves.

There was a very great gathering criticism of the whole Kefauver Investigation, but in spite of this he introduced Bill S1552 in the United States Senate and I hope this Committee will study this Bill in connection with what you are proposing to do here.

Now, this Bill was actually in three parts. It affected three different United States Laws—the Sherman Antitrust Act, the Patent Act, and the Food, Drug and Cosmetic Act. You can ignore the proposed Sherman Act revision as it is in a specialised region that does not affect the Indian Patent law at all.

The proposed US Patent Act revision was drastic, and here if I may, I will read from my Statement in view of some of the parallel provisions proposed in the Indian Patents Bill. One provision would have prohibited grant of patents for molecular modification or new combinations of existing drugs unless it was determined that the therapeutic effect is significantly greater than that of the original drug so modified or combined. Another provision proposed to reduce the exclusive term of a drug patent to 3 years, after which it would be available for licensing to any qualified third party (for the next 14 years) for a royalty not exceeding 8 per cent per annum. Such compulsory licensing would also require the disclosure of the original applicant's know-how.

The Federal Drug and Cosmetic Act provisions were numerous and I do not think we really need to be concerned with these here in discussion of your Patents Bill, but they were the ones to which the Pharmaceutical Industry in America was quite sympathetic.

There was very little comment on the very specialised revision of the Sherman Act. However, the patent provisions were strongly objected to by all sectors of the industry, by economists and patent experts. I will refer in a minute to these exhibits I have here which I do hope will be read by many of you.

After all this, the Kefauver Bill went through the legislative machinery of the United States Congress. I would point out that the Kefauver Antitrust Sub-committee was merely one of several Sub-committees of the main Judiciary committee. In accordance with the usual procedure these provisions were referred back to the Patents Sub-committee. Now, this Committee held its own hearings, reviewed the matter thoroughly, talked to many experts and then it disapproved the drastic and controversial patent provisions. This disapproval was confirmed by the main Judiciary Committee in the final Bill which was actually submitted to the Congress.

The only legislation that was then finally enacted in the field of Patents, as a result of the whole Kefauver investigation extending over many years, and which was signed in due course by President Kennedy, are two minor and limited statutes. I will not read them in detail because you will have the text here in the Exhibits. One provided for recordal of patent interference settlements in the Patent Office. You do not have interference practice here, so it should be ignored. The other amendment was to enable the U.S. Patent Office to call on the Secretary of Health to furnish technical information concerning drugs if he wishes to do so. In actual practice there have been very few instances of requests as the Patent Office has its own qualified examiners.

About these Exhibits here, you have not yet got, I think, a copy of this list, but it will be available to you. I am referring you to the main Kefauver report to the U.S. Senate. I would refer most strongly to pages 105 to 154 which deal with patents and research relating to drugs. And I would point out as an illustration of the many misleading statements in

the whole Kefauver investigation, that on pages 106 and 112 there are totally incorrect statements relating to India itself. I would also refer you to point 3 of the minority report beginning on page 138.

Of these Exhibits, number 4, entitled "Prescription drugs and the public health" is a digest and summary of the complete presentation of the Pharmaceutical Manufacturers Association in America. And there is very interesting testimony from Prof. Rostow and Mr. George Frost, a well-known American Patent lawyer. I may point out that it was originally proposed at the end of last year that Mr. Frost, who was actually a witness before the Kefauver Committee in this field, should come over here because he had the most expert knowledge of the whole proceedings and would have been able to answer any of your questions. But Mr. Frost has just been appointed Patent Counsel of General Motors Corporation and his new duties made it impossible for him to come over here. But Mr. Frost made available all his files to me and I spent many hours with him talking over what we considered the key points. So even though I can't pretend to be an expert on the Kefauver investigation, I think I have a certain amount of general information and can refer you to the particular things of interest to you. I may for the record refer now to exhibit No. 5 which is called "Legislative Analysis." This is a fairly brief pamphlet which gives a complete summary of the legislative results of the Kefauver hearings. I would draw your attention particularly to these passages—the summary on page 1, the introduction on page 4, and the digest on page 6. All these are quite brief. I would refer you to part 1 entitled "Competitive Structure of the Pharmaceutical Industry" on pages 7 to 23. I would refer you to part 2, "The Nature of Ethical Competition" on pages 27 to 47. I would refer you to part 4, "The Patent Code Amendment", on pages 55 to 64, and part 5, "The Food and Drug Amendment" on page 68. All of those, I think, are well worth your consideration. I also refer you to item No. 6; this is unofficial but is a complete comparison of the Kefauver Bill—the Senate Bill S1552 introduced by Senator Kefauver with all its ramifications—and the Bills S1552 as finally enacted. It must be said that the mountain laboured and brought forth a mouse; the final patent revisions are of completely minor significance. These are the Kefauver Exhibits. I leave with you and which will, I hope, be of interest to you.

I now turn, Mr. Chairman and gentlemen, to Section 6 entitled "Recent World-wide Developments Affecting Patents." I believe that all the following specific foreign developments have a bearing, in their different ways, on the general Indian patent situation, and I submit that each of them and all of them are reasons why the Indian Parliament should not take precipitate action in this field in a direction which, I believe, is contrary to the world-wide trends in this field.

First, there is a new concept in patent law which has recently been introduced. Acually, I believe the origin was in France, very surprisingly. Now, as you know most major industrial countries long ago incorporated examination procedures as distinguished from simple registration. France and Italy and some other countries are exceptions, but all the others in Europe and the United States, and Japan and countries elsewhere in the world and, of course, including India, examine patent applications the reason being to try and get a reasonable presumption of the validity of the claims instead of having claims put in by the applicants which are far too broad so that it is very difficult to determine what the scope is. I would say, in general, the strictness of the examination in any given country is a measure of its industrial development. The purpose is to issue only patents of reasonably certain and well-defined scope. But the rising

tide of invention everywhere has begun to swamp patent offices, and in practice serious backlogs have developed and the quality of the examination has declined. And I think top officials in the Indian patent office are well aware of this problem.

Now as a solution to this, what is called "deferred examination" has been proposed. This means in essence that a patent application is filed and assuming it is in formal order, it is published quickly; when I say 'quickly', I mean, within 18 months or two years. Now it is considered that early publication is a great benefit to industry and to everybody concerned and that a great delay before a new invention is published is not a good thing. But the idea is that the actual technical examination in the patent office should be deferred at the option of the applicant or at the option of third parties. As you know, it often takes four or five years in any case before an invention is commercially developed. It is a great waste of time in patent offices to examine every application because ultimately so many of them fall by the wayside. So, it is much better to examine only those which are likely to be important inventions.

This proposal gives any applicant the option to request that his application's examination should be deferred by say some 5 to 7 years. On the other hand, since it has been published some parties may be interested in this very field and wish to be quite certain of the scope of this invention. So the idea is that the third party can come in and also request examination. But the general proposition is that the burden on the Patent Office is relieved, because it does not have to examine every case and if a given application has not been examined at the end of this 5 or 7 years term, then it is just considered as abandoned. If no request has been made, it is not considered of interest and it is assumed that the applicant is not interested and third parties are not interested, so that the Patent Office has not had to waste its time to give consideration to this case. This is a totally new idea in recent years. It has met with some criticism, as new ideas are generally met with criticism. But I would say, generally the merits of this idea are beginning to be appreciated. Holland is the only country that has as yet adopted this, actually in practice, and there were among members of the Dutch Patent profession grave doubts whether it would work. I have consulted them and also the President of the Dutch Patent Office. It can now be said that upto the moment, it is working satisfactorily and it has cut down the burden on the Dutch Patent Office by something like over 60 per cent. Now under such deferred examination procedure, many other benefits might arise which have not yet been explored. These statistics are not yet very accurate but the Dutch experiment is being closely watched elsewhere in the world. A Bill has actually been introduced into the German Parliament for deferred examination in Germany. That, of course, would be a major step which should have influence all over the world. It has been proposed in Australia also. Now I do not suggest, of course, that this Committee should study this proposal in detail, but I do submit that this is something which is being considered elsewhere in the world as a solution to a very grave problem in Patent Office operation.

The next section relates to Harmonization of Patent Laws. This is something which is going on very quietly particularly in Europe. As you know, in Europe, the Common Market authorities proposed the entirely new concept of a single European Patent. The actual text was prepared but for various political reasons and other reasons and partly due to the enormous complexity of this proposal, it has not gone through and personally I think I am correct in saying there are considerable doubts as to whether it ever will be enacted. The inter-

nal and external problems of this proposal have not been solved. There is the question whether outsiders not in the Common Market should be invited. That is not relevant to this particular session here. Many experts and industrialists consider that harmonisation of the national patent laws is a far more simple and practical approach and in any event would be an essential preliminary to any multi-national operations. This harmonisation movement is proceeding quietly in Europe, and among the exhibits I have here are the texts of two Treaties that have been enacted—one making formalities in the countries the same and the other relating to substantive law to unify legal concepts. I merely mention these things to indicate that there are worldwide trends in the Patent field at the present time and this Indian proposal is so specifically contrary to these worldwide trends that I feel I should draw these general considerations to your attention.

I would refer now to the International Convention. Chapter XXII of your Patents Bill indicates that India may in the future wish to join the International Convention. India is free to join International Convention at any moment. Any country can join merely on request, but the provision of your Bill are so contrary to the provisions of the International Convention that it would be a very anomalous situation. The International Convention now has some 80 or more countries and I would point out that Russia recently joined and a very interesting publication which is available here in the Exhibits discusses the Russian Patent Law in relation to the International Convention. Surprisingly it finds that the Russian Patent Law is not contrary in many respects to the provisions of the International Convention. The main provision in the patent field of the Convention is the one year priority provision. That of course from the practical point of view is most important. When Indian industry develops and you have many domestic inventions made, as I am certain it will happen, that provision of the International Convention would be of vital importance because otherwise your inventors would have to hurry and rush, as I pointed out, to file in other countries before publication. There are certain South American countries that are not yet members of the International Convention. In my own practice in America, it is often a great problem making a decision—should this case be filed, immediately or should the member take a chance and wait. The provisions of the International Convention constitute a minimum set of rules, apart from the priority provision, about compulsory licensing, national treatment, and so forth. The adhering countries bind themselves to adopt them. That does not necessarily mean they actually do carry out these provisions, because in most countries even when an international treaty has been signed and ratified, domestic legislation is necessary to effectuate the provisions of the treaty. I might point out that for many years, although France in a way was the home of the International Convention, going back to 1883 and known as the Paris Convention, France did not have any compulsory licensing provisions until about 10 years ago. All that time, France invalidated a Patent if it was not worked, after litigation by request of third parties. Italy, a long time member of the International Convention—almost from the beginning—still does not have compulsory licensing provisions. A patent in Italy will be revoked if it is not worked, if a third party objects and brings suit on that ground. There are anomalies. If an Indian law were to be enacted based on this Bill, this would not prevent India becoming a member of the International Convention, but it would cause a very much more anomalous situation because the provisions in India under a Patent Act based on this Bill would be so contrary to what would amount to your commitments under an international treaty.

The next point is about the BIRPI Model Law that has been drafted on which you have already heard evidence. An Indian representative was present at the discussions of the Model Law before it was adopted, I think, your Controller General of Patents. So, it is rather anomalous that the Bill as presented should contain provisions which are totally different from those of the Model Law.

I am convinced myself that in a country where the economy is developing rather than highly industrialised, the provision of Patents of Confirmation is extremely useful, and that, of course, is one of the optional sections proposed in the Model Law. It takes many years for an invention to be developed practically. Foreign patentees would come to India, and obtain a patent for something which was already a practical, useful invention. Of course, Patents of Confirmation would be subject to compulsory licensing if not in actual production in the country like any other patents. I would recommend a study of the benefits of Patents of Confirmation which are adopted in some countries at present, particularly in South America, and I believe that the comments of BIRPI on Patents of Confirmation are well worth consideration.

In the United States, I can assure you we do have our own patent problems. As you know, the U.S. law is very different from other countries as regards claim practice and patentability. The backlog in the U.S. Patent Office has increased, and industry is gravely concerned by the potential consequences. There have been many proposals for amendment. In April, 1965, President Johnson appointed a Commission to study all aspects of the patent system and recommend appropriate changes. The American Patent Law Association established a special committee to study this, of which I am a member, to advise and report to the Presidential Commission, and many proposals are under very intensive study. It is far too early yet to say whether these proposals will be favourably received, but many of these proposals are quite radical and drastic, and there is quite a possibility that ultimately the U.S. law will be amended and brought into much greater conformity with the laws of other countries. It is definitely true that a change in the American patents system would be of great interest all over the world. I would suggest that possibly India might wait and see what happens in the United States and other countries also before proceeding with this very different, specific, drastic legislation.

I now come to my general conclusions. There is a ferment in this whole patent field all over the world. It is not peculiar to India alone. On top of this there is the general idea of international co-operation. Duplication of effort of patent offices in examining and re-examining the same invention in different countries is admittedly waste of time. You probably know that there is already in exitence an international institution at the Hague which uses the remarkable facilities of the Dutch Patent Office Library, and there a very excellent examination can be made. There is a proposal that patent offices all over the world, including even the U.S. Patent Office, may begin to use these facilities, in other words have a centralised examination system to avoid duplication. This is one of the proposals.

Some time back at the World Peace and Law Conference held in Washington, they surprisingly introduced an industrial property section, indicating how important it is from the world point of view, and since this was a very general meeting, I spoke about what might be the patent situation in the world in the year 2,000A.D. It is all speculation and nobody can prove me right or wrong, and I indicated there might even be an international satellite for exchange of information by patent offices all over the world. It is quite possible.

I would emphasize that because of the very technical nature of the patent field, it is usually quite difficult to get the attention of Parliaments to patent legislation, and when comprehensive changes are made, they are likely to remain for a very long period. The present Indian Patent Law has been in force for over 50 years apart from certain specific amendments. It would be most unfortunate if a new patent law should be enacted, which is quite different from that of other countries, and which might remain in effect for a long period. I feel that this might even hinder India in its struggle to take its deserved place as one of the world's largest markets.

At the present time, India does not have sufficient capital resources of its own to finance all the industrial expansion and investment that is needed to maintain the necessary rate of growth in all sectors of the country. No one can predict how the restrictions on patent rights—they are very definite restrictions—in this Bill would hamper the future flow of investment capital. I am being followed by Prof. Kilbridge tomorrow. He is an expert economist and he will be able to deal with those aspects.

American capital has many competing regions of interest. As an analogy, I would refer to an article in *Chemical and Engineering News* of November 15, 1965, entitled "Low Capital Spending Mars Italy's Economy". A quotation reads:

> "U.S. chemical firms are slowing down their Capital outlays in Italy this year. U.S. dollars are skirting Italy in favour of West Germany and the Low Countries."

The general climate for foreign investment is complex and depends on many factors. I want to point out that Mr. Nehru himself, in his book "Nehru: the First Sixty Years", has said that "I do not think it is possible for India to be really independent unless she is a technically advanced country. I am not thinking for the moment in terms of just armies but rather of scientific growth."

I submit that if certain conditions now in any specific industry here in your country are of concern to the Government, it would seem that suitable specific legislation or regulations should be or are available, to control or ameliorate them without attacking or debasing the patent system, a system which is really the handmaiden of scientific growth.

May I very respectfully urge that the Patents Bill should be further studied in the light of what other countries have found to be a very satisfactory procedure. When important new legislation is contemplated, I would suggest that the Government might appoint a Special Commission, a Commission of prominent citizens from all sections of the community, to study the true interests of industry and the public under the patent system and then make appropriate recommendations after considering developments in other countries.

I can refer to England, Canada and the United States and their Commissions, for example. In conclusion, I would say that the best patent laws are indeed the simplest ones, and not the complex ones, as has been very well proved by what is going on now with the revisions that are being made and proposed in other countries.

In connection with this conclusion of my Statement, I would finally refer you to the Exhibits here. I hope you will read them. The first one is a copy of a memorandum which one of my partners submitted to Mr. Modawal of the Ministry of Commerce in connection with Registered User practice under the Indian Trade and Merchandise Marks Act. 1958. The comments on page 1 relate to an air of suspicion and to the severity of requirements and formalities which do not exist elsewhere in the world. I say that the unfortunate air of sus-

picion is relevant to the present situation and the provisions in this Bill.

I would also refer to the Canadian Royal Commission Report. It is true that the Canadian patent law has not yet been amended for various political and other reasons, but the Royal Commission conducted most comprehensive hearings; I was a witness before them and if you refer to page 23 of the Report, you will find that one of my proposals was very favourably considered by the Commission.

I have some documents here relating to one of your famous scientists, Dr. Yellapragada Subba Row and the recently established Subba Row Memorial Library in America. There have been many famous Indian scientists of world-wide fame, such as Dr. R. C. Bose, Prof. Raman, Dr. Chandrashankhar, and Dr. Bhabha who unfortunately was tragically killed recently. I wish to speak of one, whom I had the honour of meeting—Dr. Subba Row, who was the Director of Research of the Lederle Laboratories Division of American Cyanamid until his untimely death in 1948, and who was also a friend and associate of Mr. R. Norris, President of the National Foreign Trade Council. Among his many achievements, Dr. Subba Row first synthesized the B^{12} vitamin folic acid and he was largely responsible for the discovery by Dr. B. Duggar of the first broad spectrum antibiotic chlorotetracycline known as Aureomycin. I personally handled the filing of patents on both these developments throughout the world and I will know that Dr. Subba Row was an enthusiastic supporter of the patent system, without which the dramatic results achieved by Lederle and other pharmaceutical manufacturers would not have been possible.

I may also suggest that this Committee should most actively enlist the interests of the Indian scientific community in patents generally and in the proposed new patent legislation. I am certain that they will confirm that Indian research and foreign investment must go hand in hand and that both will depend on a fair and equitable patent law. Thank you.

Dr. C. B. Singh: We are very grateful for your views, Mr. Robbins. But I am sorry that you are not an expert as far as the prices of these commodities are concerned, an aspect with which we are most concerned. But I would like you to give a reply to one question. Is there any widespread complaint about the price structure, the claims of firms, about the quality and the methods of advertisement, in respect of the pharmaceutical products in America at the moment?

Mr. L. J. Robbins: I would not say there was any widespread complaint. But over the years, in any industry, there are always specific complaints going on by certain people, as to what certain people are doing and what certain manufacturers are doing. It is common all the time. As you know, the US Government has recently appointed a new director, Dr. Goddard of the FDA, and he is very much tightening up. But what he is doing in the field of quality and advertisement.

Dr. C. B. Singh: I was referring to the first speech of Dr. Goddard. He has complained very bitterly about these things, and he has given a warning to the pharmacists. Do you agree with that?

Mr. L. J. Robbins: As you know, he has only recently been appointed, and I think you know that new brooms can sweep clean. He is very vigorous at the moment, but whether what he asserts is justified is far too early to say.

Dr. C. B. Singh: He is the first Chairman who is a medical man with MD degree; the first one in forty years and that is why I put this question. He is supposed to know more about these advertisements and so on and their effect.

Mr. L. J. Robbins: You will find that possibly India might wait and see

years and in a rather remote part of the country. His experience has been in the administrative field rather than in actual practice of medicine. But, as I said, I am not an expert in this field. I am merely talking as a member of the public.

Dr. C. B. Singh: I am a doctor myself, and I am putting before you the public point of view. There is a great complaint in this country also. It is a very reasonable complaint as well. So, that question has been put.

My second question is this. You have mentioned at page five, about the examination of patent applications. You have mentioned certain difficulties of the Patent Office. What will you suggest in that regard? You have mentioned that the world literature has been growing very fast and that it becomes very difficult for the Patent Office to go through everything. What will you suggest to remedy this?

Mr. L. J. Robbins: For the time being, the provisions for novelty, of Indian patents should be restricted to publications within India, as it is under the present law. If you go to the world-wide novelty concept, the Indian patent office examiners would have to consider publications in German, Russian and other foreign languages. For that, you will have to build up first an enormous library and you will need skilled people to study all those things.

Dr. C. B. Singh: The trouble will be a good number of applicants will be foreigners themselves. So, we will have to refer to some foreign publications also.

Mr. L. J. Robbins: You will find that the applications from major countries like America are well prepared and are in good form. They know what they are entitled to and obviously they will not make their claims too broad. But applications from other countries, say France, may not be so well prepared. There is no examination in France and the claims may be rather too broad. That is why the Indian examination is important.

Dr. C. B. Singh: You have mentioned about right of appeal. Right of appeal has not been agreed to because of certain difficulties we have been experiencing in this country. If it goes to the High Court it takes 8 or 10 years or even more. That is why the Bill provides that the appeal will lie with the Indian Government. Can you suggest a method by which there would be no delay and yet the appeal will not be to the Government?

Mr. L. J. Robbins: I appreciate your point about delay. But it is not every controversy in the patent field that has to go all the way to the Supreme Court. In Germany validity is determined separately in a special novelty court which is now an extension of the patent office. In the United States and England, there are specialised courts which are constituted for this purpose. In England, there is what is known as the Appeal Tribunal and with a very few exceptions, most appeals stop there. This is a very efficient Tribunal and it disposes of appeals in a very short time. In America also, if there is a controversy about a patent application, while it is pending, it can go up to the CCPA—the Court of Customs and Patent Appeals. So, here also, except for some major concepts which involve basic rights, legal and other technical controversies can be decided on appeal by a special tribunal.

Dr. C. B. Singh: Would you fix a period for the judgment to be given by this tribunal, because time is a very important factor?

Mr. L. J. Robbins: Everywhere, if there is a controversy about a patent, a certain time is provided for appeal and if you do not exercise your right of appeal within that time, you lose the right.

Dr. C. B. Singh: The time for patents originally was 14 years. Now this Bill provides for 10 years. What is your opinion about it?

Mr. L. J. Robbins: I understand that this period of 10 years is only in certain fields like food, drugs, etc. It is contrary to experience everywhere in the world. In Switzerland, for instance, which is a small country, they had very restrictive provisions in the field of chemicals. Applications were allowed only for process claims and the term was 10 years. Finally it became ridiculous. The period of 10 years was found to be most restrictive and it actually hampered the Swiss industry. So, some 10 or 15 years ago, they enacted a very modern law comparable to that of other countries with a normal term. So, here also 10 years is not practicable and it would hamper the Indian industry. If you agree with the basic principle that the inventor should be given a limited monopoly during which he can obtain recompense and get a reasonable return, 10 years is not enough.

Dr. C. B. Singh: Do you agree that we can have 10 years and if we find that an inventor or firm has not been able to get adequate benefit and if he proves his case, the period should be extended?

Mr. L. J. Robbins: This will lead to adminstrative difficulties because the applicant will have to file petitions and you will have to hear evidence to determine the justice of his claim. All I can say is that a limited term of 10 years is contrary to the world trend.

Shri M. L. Jadhav: Do you agree that the prices of drugs in India are far higher than the international prices of the same drugs?.

Mr. L. J. Robbins: As I said right in the beginning of my Statement, I am not an expert in this field. But, as a member of the public frankly I do not think that is true about prices of drugs in India. There may be certain exceptions but I do not think it is true as a general proposition. You should put this question to an economist. He can answer this question far better than I can, I do not think I can say anything of much value to this Committee on prices.

Shri M. L. Jadhav: Assuming there is some difference between Indian and international prices of drugs, how far is it due to foreign patents?

Mr. Chairman: Mr. Robbins has explained that he is not competent to answer this question.

Shri Warior: Beginning with compulsory licensing, in the absence of any agreed solution and in the context of our retaining this clause, will you agree to the percentage of royalty proposed in this clause? Do you think it equitable and reasonab'e?

Mr. L. J. Robbins: I thought. I tried to make the point earlier. No two inventions are the same. They are different and they must be considered so. You have to consider how valuable they are, how they are developed and so on. You cannot put out an arbitrary ceiling of 4 per cent. It might be reasonab'e in one case and most unjust in another. No other country has any ceiling. In England among compulsory licensing proceedings in recent years, in one case the British Controller gave a royalty of 20 per cent. So, any arbitrary legislative ceiling is just not practicable and would be unjust. It should be left to the discretion of the Controller, as it is now. There should be no arbitrary ceiling.

Shri Warior: It is our experience that if patent rights are given for products and not for processes, then the processes are never coming to India. So, we are precluded from getting the know how. Therefore, for a country like India, at least for the transitional period, do you agree that only the process should be patented and not the product so that we can get the know how in the long run and, at the same time, need not pay exorbitant prices for import of such products?

Mr. L. J. Robbins: No, I completely disagree with you there. I think I made the point that this difference between process claim and product claim is an artificial one. From the point of view of administering he Patent Office, it is very much easier to grant a product claim than a process claim. You say that India would not have the benefit if there are product claims. If a European or American patent owner, even in your controversial pharmaceutical industry, only imports, surely the Indian industry has the right to apply for compulsory licence to manufacture in India. If that happens, there may then be a voluntary arrangement. After all, a voluntary arrangement is better than compulsion in any activity. So, I do not think your point is valid that the mere existence on paper of product claims will have anything to do with its economic aspects.

Mr. Chairman: Will it not be giving a virtual monopoly to the patentee?

Mr. L. J. Robbins: Yes. But why not? What is wrong with that?

Mr. Chairman: If another scientist by a different process could manufacture the same thing cheaper, why should that be prevented ? Is it in the interests of the country?

Mr. L. J. Robbins: If he invents a new process, he could then possibly apply for a licence under the main patent. Why should he not get a compulsory licence ? It is quite possible, if he could manufacture by a cheaper process.

Mr. Chairman: If a licence is given to him, even though it is a new process, the person who had the licence earlier will obstruct him by virtue of his patent.

Mr. L. J. Robbins: I suppose you are talking of the pharmaceutical industry. From my experience, particularly in highly skilled countries in Europe and the United States, I can say that it is really quite rare that when a good product has been found that the original patentee does not use the very best method. Also, just as a matter of business operations, when normally a company has spent years on research in a certain field, it is very rare that another competitor tries to break into that field.

Mr. Chairman: In any case, will it not amount to blocking another invention?

Mr. L. J. Robbins: No. I do not think this has hampered pharmaceutical research in the United States. On the contrary, it is a great reward, an incentive for research to be done. Please do not forget, when you say "a product", that it must be properly claimed and defined—its structure and so on. You are not allowed to get anything that is too broad because that is not justified by the original work that the inventor did or by his disclosure. Somebody else can come along, and find a modification; it is different and better he cannot get a patent on that new product.

Mr. Chairman: If, without reference to the old process, a scientist invents a new process and manufactures the same product in a cheaper way, why should he be prevented from making use of his process to manufacture the same product? Except, I think, America, almost all countries have only process patents.

Mr. L. J. Robbins: In this list in the Exhibits you will find that at least 50 per cent of the countries throughout the world give product protection. As I said, the difference is becoming artificial. Under your own present patent law, a scientist who invents an entirely new process for making a known product could get a patent for it. You know that. If you had product patents in this country, the inven-

tor of this new process would have to apply for a licence under the dominating patent. And why should he not get it? If he has applied for a compulsory licence and if his grounds are good enough, he can get it at a reasonable royalty and can manufacture under his improved process. After all, he was not the basic originator of the product: he came along latter. It is true, he has made a contribution and nobody can prevent him from using it. The only thing is that he will have to pay a reasonable royalty to the basic patentee. What is wrong with that?

Mr. Chairman: They have been prevented here in India.

Shri Warior: Some manufacturers may have different processes for a product and may not be giving out all the processes to the patent office in the first instance but may, at the time of the expiry of the right after 14 years or so, bring forward a very small amendment of the same product and take out another patent so that the protection to the product or the process is extended still further by 14 years precluding all others from having the advantage of utilising that. As Mr. Robbins suggests, technological development is taking place so fast and new processes are coming up and this monopoly right is coming in the way of those new processes being operated upon. So, should there not be anything about that in the provisions of this Act?

Mr. L. J. Robbins: I consider that that argument is in favour of product protection. If you grant only process patents, when the first one has expired, that is available for anybody to practice because the term has expired and there is no more monopoly. If somebody invents another process, he would have to compete with the original process. You say that this is better. Well it may be better; but talking in simple terms like "better" I assure you, is not very practical. It is very rare that some absolute third party comes in and finds a better process. It is true, it can happen; but I can tell you, that this is not generally the experience of countries elsewhere in the world.

Now, here are two major countries, the United States and England. Both have product patents. The new Scandinavian law, which probably will be enacted in the four Scandinavian countries,—permits product patents in this field and it is highly likely that in the near future Germany will adopt it because, as I say, the distinction has become so artificial.

I appreciate your position here. I have been to India several times and I know what your problems are. However you think that this emphasis on the distinction between product claims and process claims is a better solution, but I can assure you that it is not.

Shri Sham Lal Saraf: While I appreciate very much the lucid and detailed exposition that Mr. Robbins has given to this Committee, I would like to ask him a few questions. After hearing Mr. Robbins I find that there can be two approaches—one that of a scientist and the other that of a lawyer. All that Mr. Robbins has explained, to my mind, is the legal approach. As rightly pointed out by the hon. Chairman, the scientist feels the other way round. The scientist feels that there are other processes which could be found out to reach the same end-product. Speaking strictly from the legal point of view, I agree with the contention of Mr. Robbins of registering under the patent law the process-*cum*-product, but in our country there are two or three things which have to be kept in the background. Firstly, we have very poor know-how here; secondly, we have just started particularly in the pharmaceutical line and, thirdly, there is the question of capital about which there is no mention in the note of Mr. Robbins. Keeping that in view, our countrymen, particularly our scientists, are very much urged to go ahead about finding out the new know-how. Now if some Indian scientist is in a position to find out a particular product through

some process which is not included in the patent of the patentee who has taken out a process-*cum*-product patent, speaking strictly from the legal point of view will you agree that such a scientist should be accommodated either through compulsory licensing or through some other provision in the law?

Mr. L. J. Robbins: I appreciate your problem and view point, but I would point out that there has been a revolution in chemistry in recent years. What was called, chemistry a generation ago was a difficult and an empirical science. It is becoming much better organised now and we are finding out so much about the nature of chemical reactions. In the field of pharmaceuticals—you all seem to come back to this—the main problem is how to find a product to do some specific job. In India you have certain problems of tropical diseases. The accomplished scientist, the doctor-scientist, through his knowledge has a very good idea of what he wants and what its structure would be, but the point is that he has to make it first and try it out. It may work; it may not work. The actual process of making it has now become relatively simple, because most processes now claimed in patents are really only one step. You put this molecule together with that one and something happens; they join up. As I say, this is now becoming rather common knowledge to all scientists. So, there is not so much invention any more in working out the chemistry of the steps; it is more in knowing the sort of product you want and what it will do. For that, of course, the main research problem is to make a series of these related products and try them out medically to find out which one works. When you talk about a better process or say somebody comes along with a better process, the original work was really done by the basic inventor. The second man who comes along with a better process can do research in his own field, but the second man is not the original inventor.

Shri Sham Lal Saraf: Therefore, some accommodation is called for.

Mr. L. J. Robbins: The whole purpose of the patent system is to provide a reward and unless it is a reasonable reward, it will not work. I do not know whether you have considered this. In America, you know, we talk about somebody who gives something and takes it away as an "Indian giver". Of course, we are not talking about Indians here; we are talking about our own Indians. I feel your proposed Patent law in one way offers a reward and takes it back in another way.

Shri Sham Lal Saraf: My question is very specific as explained by the Chairman. There is a local scientist who just invents a new process and comes out with a product which is already patented. The process is different and the product is already patented. Will you give some reward to a person who has invented a new technique or a new process? Keeping that in view, what I was putting to you was whether such an inventor or such a person who is able to invent such a process be given some accommodation under the law.

Mr. L. J. Robbins: What do you mean by 'accommodation'?

Shri Sham Lal Saraf: For instance, compulsory licence or something like that. The Committee may think about that.

Mr. L. J. Robbins: We are assuming that there is a product patent and that another inventor comes along with a new process which is not described in the original. Well, he can obtain a patent because it is a new process. He can also obtain a compulsory licence and he will have to pay a royalty which should be reasonable. Surely, he is not hampered. The only thing is that he will have to pay a reasonable royalty which I consider is just because he is not the basic originator and he comes along as a

secondary man who has made an improvement. It seems to me that that is perfectly fair and that would not hamper the Indian industry at all.

Shri Sham Lal Saraf: The second question is this. You said about India joining the International Convention. May I know what may be the pre-requisites for a country like India joining the International Convention so that the policies and the programmes followed under the International Convention are kept at par in this country also?

Mr. L. J. Robbins: No pre-requisite whatsover except that it is assumed you have to have a patent law. If you look at the list of countries, you will find countries like Indonesia....

Shri Sham Lal Saraf: What I mean to say is whether there is anything specific under the patent law that may be enacted or enforced in a particular country for joining the International Convention?

Mr. L. J. Robbins: There are two aspects to that. If a country joins the International Convention, there will be the question: Is this a country where the whole of an International Treaty is self-enacting? In other words, if so, everything in the International Convention automatically applies to that country. The other question will be: Is this a country where special laws have to be made to conform with the Convention? I believe that the Convention would not be self enacting in this country. Am I right? I am sure there are some lawyers on this Committee. I believe that is correct. If you join the International Convention and you wish to comply with all the provisions, you would then have to make some special legislation to alter the provision of a law based on this Bill particularly in the field of compulsory licensing.

Shri Sham Lal Saraf: As a corollary to this, may I ask this question. You mentioned about the international cooperation with regard to the patent law and the relation that it will have among the different countries. May I know what can be the outstanding points which will ensure that international cooperation?

Mr. L. J. Robbins: International cooperation, obviously, depends on people doing certain things. There is already an association of the heads of Patent Offices, at any rate in Europe. They are cooperating with the United States Patent Office. They have continuous meetings; they are talking over all this and trying to adjust their procedures. There is no reason why they would not be delighted to cooperate with India.

Shri Sham Lal Saraf: In this international cooperation, there should be some area of agreement among the cooperating countries.

Mr. L. J. Robbins: I think, essentially, yes. There is already, at present, an informal arrangement—let us call it semi-official. It is because of this that the Indian Patent Office should cooperate, generally, with the European Patent Offices and the United States Patent Office and that would be a very fine result.

Shri Sham Lal Saraf: While giving out your mind on certain issues, you revealed the information to the Committee that till now there are 20 business or commercial relations established by American firms with their American know-how and that there are 30 service connection also established. May I know whether you are apprised about the experience that they have gained in India and whether that know-how is bearing some success? Secondly, may I know whether that know-how is getting cooperation and appreciation from Indian scientists as well as from Indian businessmen?

Mr. L. J. Robbins: These are members of the National Foreign Trade Council. As far as I know, basically they have had some problems. But

they would not be here unless they were satisfied with the prospects here in India. You would hardly invest your capital unless you know there are good prospects. Surely, they would not be here unless they thought that the future was good. That is all I can say.

Shri Sham Lal Saraf: You mentioned today about the American capital getting sceptical for investment so far as Italy is concerned. I suppose there is no such position as far as India is concerned?

Mr. L. J. Robbins: I did not say that American capital was completely removed from Italy. There are political considerations....

Mr. Chairman: He said the same-thing may happen in India.

Shri Sham Lal Saraf: Today, that is not there. Today, all the American know-how has been imported into this country. What I want to find out is this. Whatever items we have patented under the law, the American know-how has been imported into this country—the experience is not otherwise—and today it is not as it has been expressed in Italy.

Mr. L. J. Robbins: I know that an enormous amount of know-how has been brought here, many products of the most modern type are being made.

Shri Sham Lal Saraf: You said that, as far as industrially advanced countries like Germany and Japan were concerned, most of the patents were owned by foreigners. May I know whether it is necessary to create some climate here in favour of getting those patents registered and if so, what sort of climate is to be created?

Mr. L. J. Robbins: I said that there were three countries—the United States, Germany and Japan—where the majority, since they are highly industrialised, were taken by their own nationals, but even so, in those countries, there is a very substantial number of patents taken out by foreigners. In the United States, it is as large as 25 per cent and in Germany and Japan, it is probably more; so it is only a matter of degree. There are many many foreign activites in the United States; in Germany and Japan also, there are many foreign activities. This is coming back to the international co-operation theory in the technical field.

Shri Sham Lal Saraf: My point was about creating some climate before a foreign patent can be successful.

Mr. Chairman: Please do not go to general questions. Ask only a few questions.

Shri Sham Lal Saraf: In the background, a number of things come up. We have examind so many witnesses.

Mr. Chairman: Still there are so many members who have to put questions. Please put only a few question.

Shri Sham Lal Saraf: Mr. Robbins, I hope you catch my point. I was asking whether any particular type of climate was necessary for getting the imported know-how successfully or getting imported patents registered.

Mr. L. J. Robbins. I think I said at the end of my Statement that the very best solution would be to interest the whole scientific community. I would think of appointing a special Government Commission. This is a case of education. In America, some scientists and some businessmen are not even now fully acquainted with the whole patent systems. It is one of the fields where it is necessary to go back to first principles, *i.e.*, education. Obviously the whole thing will not develop unless the scientists are fundamentally interested.

Shri Kashi Ram Gupta: You have explained at length about compulsory licensing, but nothing has been said

about "licences of right". Will you please give your opinion about "licences of right"?

Mr. L. J. Robbins: I consider "licences of right" as of negligible importance. If something is available to everybody, nobody wants it. The idea of "licences of right", I think, probably arose originally in the English-speaking countries—and basically this whole provision of so-called "licences of right" was meant for the poor inventor, the individual inventor, who may have a small invention. As you know, in those countries, you have to pay taxes on a patent, "licences of right" were tied up with taxes; if you endorsed voluntarily your patent with the words "licences of right", you pay half the taxes. But personally I do not know of any case where anybody has requested a licence under a patent endorsed "licences of right". It is against human nature because everybody can get it. If you obtain a licence and start investing on it and put the product on the market, everybody else would be able to come in. A very good example of that is this; after the last War, all enemy properties were seized in America, including industrial property rights and patents. All German and Japanese patents were made available by involuntary "licences of right" to anybody in the United States for one dollar. As far as I know,—there may have been a few minor exceptions—nobody took advantage of that. Why should anybody get a licence under an involuntary "licences of right" when his competitors could also come in and get the same benefit out of it? I consider "licences of right" whether voluntary or involuntary as ineffective and as a matter of negligible importance.

Shri Kashi Ram Gupta: Are you in favour of including these provisions or are you against these? Our Bill has got this clause and the Model Law has also got the same clause.

Mr. L. J. Robbins: They are not the same, but as I said I consider it as of negligible importance.

Shri Kashi Ram Gupta: The question is not whether it is of negligible importance or not. My question is whether you are against it or are in favour of it.

Mr. Chairman: It is for us to decide.

Shri Kashi Ram Gupta: In the Model Law, on page 49, about the time limit for a patent, it is said—it is given in the final commentary at the end of the first para—that in any case a patent will be valid for at least ten years after grant. What is your opinion about "after grant"—not from the date of application.

Mr. L. J. Robbins: I am sorry, I do not know what exactly is the question. What is this "ten years after grant"?

Shri Kashi Ram Gupta: There are two or three ways of loaning it: one is from the date of application; our present policy is the date of completing the specifications; the third is from the date of grant of the patent.

Mr. L. J. Robbins: A patent does not exist until it is granted. When it is filed, it does not acquire status because it is so uncertain; it may be changed during examination. Only when it is granted do you know what it is. It does not exist as industrial property until it is granted.

Shri Kashi Ram Gupta: At present the Bill contains the provision that the ten-year period will be from the date of completing the specifications, while the Model Law contains a provision that the ten years can be from the date of grant of the patent.

Mr. Chairman: It is for us to decide. Why do you want his opinion? The Model Law is for our consideration.

Shri Kashi Ram Gupta: He has quoted the Model Law in his speech. That is why I wanted to know his opinion.

Mr. Chairman: He has supported it.

Shri Kashi Ram Gupta: Yes; that is why I wanted to know his opinion on this specifically. This is the way the pharmaceutical industry is organised: they have got their research laboratories; they have got their yearly expenditure; they have also got income-tax assessments. Therefore, when this is the case, how do you say that 10 years will not be sufficient for any one who makes an invention because when the inventions are mostly applied for by firms who employ the scientists and those scientists may be getting regular salaries or any remuneration which may be agreed to between them and the firm, but the actual inventions are applied for by the firm. When such an arrangement is there, why is the 10 year period not sufficient?

Mr. L. J. Robbins: I can only refer to what the experience is in the rest of the world. I mentioned that Switzerland is a country which has got rid of this 10 year limitation. That is a country where probably there are more patents owned by foreigners than their own nationals. That is true of most of the countries of Europe. That is true of Holland. That is true of Belgium. They all have no limitation of 10 years but a normal term for all patents. They do not discriminate between patents in the pharmaceutical field and patents in the other technological fields. I say that from my own experience, which has been tied up in recent years with the pharmaceutical field and I am well-acquainted with research in the USA and Europe, it usually takes a minimum of 5 years from the initiation of the idea or the concept before it gets to the market. As you very well know, in this pharmaceutical field you cannot just make a product and sell it to the public and a minimum of 5 years is necessary before the product is refined and ready for the public. So, out of the 10 years, only 5 years would be left and that is too small a period to make a reasonable profit. The patentee has been spending a lot of money during the initial period to get the product. Also researchers may have to possibly make 100 attempts to make a new pharmaceutical product when probably one is successful.

Shri Kashi Ram Gupta: These expenses are regular expenses of the firm. They are not special expenses of one particular aspect. From the economic point of view these are all allowed yearly. This is my point. Dividends are declared after all these expenses are allowed in income-tax assessments.

Mr. L. J. Robbins: This question really, I feel, relates to economics and I cannot really pretend to be an expert there.

Shri Kashi Ram Gupta: You have said that the Patent Law is being examined in America and there are some controversial points in it. You also say that we must wait till the result of that comes out. How much time will it take?

Mr. L. J. Robbins: I did not say 'You must wait'. I just made a suggestion.

Shri Kashi Ram Gupta: I am inquiring about the time it will take for the American Govt. to arrive at a decision.

Mr. L. J. Robbins: They are in a great hurry. As I said my Sub-Committee has worked all last year. We have had meetings every month and the President's Commission which was appointed in April, 1965 hope to report to the President in October this year. It hopes to make definite recommendations. As I say whether there will be an actual change may take some more time, but there is going to be something definite in October, 1967. We are proceeding with great speed.

Shri Kashi Ram Gupta: Our Patents Bill so far as other items are concerned, leaving aside the drugs, has laid down a period of 14 years. Formerly, it was 16 years. Therefore, there is a deduction of only two years. What is your opinion about this?

Mr. L. J. Robbins: In the present-day conditions 14 years is not long enough. It is contrary to the main trend. The main trend seems to be 20 years. That seems to be reasonable and most patents take 3 to 4 years at least before they gain ground and so they are left with only 16 or 17 years real protection.

Shri Kashi Ram Gupta: In India in the present circumstances no representation has come from any quarter regarding other items excepting drugs.

Mr. Chairman: I think each hon'ble member should not ask more than 2 questions as there are other members also who would like to put question. So much of evidence has already come.

Shri Kashi Ram Gupta: When he comes to give evidence, questions also should be put to him that there are no representations in this regard from others.

Mr. Chairman: We have other witnesses also.

Shri Kashi Ram Gupta: So far as other items are concerned, there are no representations.

In the last paragraph of your memorandum you have said:

> "On the basis of these submissions, I respectfully urge that Patents Bill 1965 should be withdrawn for further study In the light of what other countries have found to be a very satisfactory procedure when important new legislation is contemplated, I suggest that the Government should appoint a Special Commission of prominent citizens from all sectors of the community to study the true interests of industry and the public under the patent system, and to make appropriate recommendations after also considering the developments in other countries."

You may please note that this is a sovereign body of the Parliament where all interests are represented and this Bill was drafted by Government on the basis of the Justice Ayyangar Commission's recommendations which has gone in detail into the Patent laws of other countries also. What more is required? Then how have you been prompted to say that this Bill should be withdrawn and a Special Commission of prominent citizens appointed to go into it?

Mr. Chairman: That is a suggestion he has made. It is for you to accept it or not.

Shri Kashi Ram Gupta: What does he mean by a Special Commission of prominent citizens? That I want to know.

Mr. Chairman: I don't think he has read Raja Gopala Ayyangar Commission's report.

Mr. L. J. Robbins: I merely respectfully submitted that as a suggestion. I am well aware of what is going on. I know the Ayyangar Commission's report and also the previous one. But I would point out that there have been no recent public hearings in connection with this problem and the present draft of the Bill seems to be, at least to my mind, just putting the cart before the horse. I would suggest that normally it is necessary to have hearings to get the benefit of the present views of industry, the patent profession and scientists before specific provisions can be prepared.

Mr. Chairman: Here too, Government draft the Bill and introduce it in Parliament which remits it to the Select Committee. We do not generally publish the Bill, Government publish it in the Gazette and anybody interested can send his views.

Shri Kashi Ram Gupta: Are you aware of the fact that a large number of Indian scientists are for a short period for patents?

Mr. L. J. Robbins: I am not aware of that. What is the reason?

Shri Kashi Ram Gupta: They want a shorter period than what has been contemplated in the present Bill.

Mr. L. J. Robbins: But they must have some reasons for their opinion. What is that?

Shri Kashi Ram Gupta: They have given the reasons also. Finally, I want to ask you one thing. As you are giving evidence on behalf of the other Association also, there is a point mentioned there. There is a company called Selas Corporation. They have not taken any patent in India. Why could not this company come to India for the last 15 or 16 years when the old Patent Law was in force?

Mr. L. J. Robbins: I am afraid I don't have enough information to answer that question.

Shri Kashi Ram Gupta: This is contained in another memorandum given by the National Association of Manufacturers. So, because I was told this morning that you are also giving evidence on their behalf, I put this question.

Mr. L. J. Robbins: No. I am not appearing here on behalf of the National Association of Manufacturers. Their representative has not been able to come. So, the Chairman gave me his time.

Shri Bibhuti Mishra: You have suggested that this Bill may be deferred or postponed or delayed and after that you want a high-powered commission to be appointed and that the commission should go all round the world. Then after that, taking the experience all over the world, this Bill should become an Act of this Parliament. What is your idea? Why do you want this to be delayed?

Mr. L. J. Robbins: I can only say that my viewpoint is entirely pro-India. I am merely trying to submit that on the basis of my experience, I consider this Bill is fundamentally restrictive and I am merely drawing your attention as a Committee to what is taking place elsewhere. I am not proposing that you should appoint a Commission tomorrow and send it round the world. That is not what I said at all.

Shri Bibhuti Mishra: You are in favour of patents. Keeping the conditions of India in view, how much do you want to give to the inventor as honorarium, how much should be the profit for the industry and what would be the price for a particular medicine in a country like India which is very poor? Do not compare with America or Western countries.

Mr. Chairman: He says he is not an expert on prices.

Shri Bibhuti Mishra: We are concerned with prices. He comes from America which is one of the most wealthy countries in the world and if the price of a particular medicine is one dollar, here the people of India would not be able to pay one dollar. So what would be the benefit for India? Suppose a patentee comes from America to India and if he manufactures a medicine here, what would be the price for that medicine?

Mr. Chairman: He says he is not an expert on prices and can't answer questions on price. He has said he is a patent attorney. Tomorrow another witness is coming. He is an economist and you may put this question to him.

Shri A. T. Sarma: Your Council has suggested the postponement of the Bill until the situation in other countries is clearer. You say that the American Government is also reviewing the Patent Law and you ask us to wait till that decision comes out. But we think we need not wait till then. We think we should pass this Bill at present to improve our research and development and industrial activities. If it becomes necessary later on, we can bring an amending Bill. So we find that the ground given for postponing this Bill is not sound. Do you agree with us?

Mr. L. J. Robbins: I am not trying to suggest what this Parliamentary

Committee should do. I am merely here to offer some suggestions based on my own experience and as I said it seemed to me—patent makers are in such a state of ferment all over the World—that possibly the things that might happen in other countries might be of some benefit to you, rather than thinking solely of specific Indian problems. This is my only sugestion.

Mr. Chairman: It is only his suggestion; we may or may not agree with it.

Shri Dalpat Singh: On page 12 of your statement, you have said that "the backlog in the United States Patent Office has increased." May I know the factors which lead to this backlog?

Mr. L. J. Robbins: Basically, it is partly due to the very complex American procedures. But it is also due to the fact that the number of patent applications filed each year has been steadily increasing. Also, there is such a demand for technically trained people in industry that they often stay in the patent office for a few years and then go into industry, and so the investigation work does not proceed rapidly. The examination of new applications just gets pushed further and further backwards which is very bad. It is bad for industry since it takes years before the new developments are published. Early publication is highly desirable for the improvement of technology and further developments.

Shri Bade: Do you agree that there should be some difference between the patent law of a developed country and the patent law of a developing country?

Mr. L. J. Robbins: Yes, I most strongly agree. That is why I think the BIRPI Model Law is a worthy proposal. I do not agree with everything here, but I think basically it is a very sound proposal and I think I said before that the best patent laws are the simple ones.

Shri Bade: That difference is made in the Model Law also?

Mr. L. J. Robbins: Yes.

Shri Bade: On page 4 of your memorandum, you have stated that "furthermore, the possibility of compulsory licences to import products would actually favour foreign over domestic Indian industry." How do you support this?

Mr. L. J. Robbins: The compulsory licensing proposals are similar to those in International Convention and those at present operative in many countries throughout the world. They are generally similar.

Shri Bade: In our Bill also, the provision regarding compulsory licensing is the same as given in the Model Law.

Mr. L. J. Robbins: No. They are far more drastic.

Shri Bade: Those provisions in the Bill are made according to the recommendations of the Model Law for the under-developed countries.

Mr. L. J. Robbins: No. The Model Law proposal is that after 3 years from grant, if the patent has not been worked, then it is only after two year of compulsory licensing that they may be a possibility of revocation.

Shri Bade: The same provision is there in West Germany, Netherlands, Italy etc.

Mr. L. J. Robbins: Which provision?

Shri Bade: About compulsory lincensing. In USA, there is no provision. In U.K. compulsory licensing of patents can be granted upto 3 years. The same provision is here in the Bill.

Mr. L. J. Robbins: The restrictive provisions on compulsory licensing involve arbitrary powers.

Shri Bade: Our provision in the Bill is identical to U.K. provision.

Mr. L. J. Robbins: Not at all. In your present patent law some years ago you adopted the same provisions as there are in England.

Shri Bade: The difference is in compensation, in the U.K. provision and our provision. Under our provision, the maximum compensation will be 4 per cent of the net product of the sale.

Mr. L. J. Robbins: There is no such provision in England.

Shri Bade: But now if we say that 4 per cent compensation is maximum that will be given on net product of the sale....

Mr. L. J. Robbins: Was not the same question asked a little while ago and I said you could not put arbitrary ceiling on things that are different.

Shri Bade: How is it arbitrary?

Mr. Chairman: Let us discuss it.

Shri Bade: Whether it should be on the net product of the sale or whether it should be on the working of the period of the patents. Just as in the Model Law, the compulsory licence shall only be granted subject to the payment of adequate royalty commensurate with the period for which patent is worked. That period should be taken into consideration. But that is not the provision in our bill. Whether that provision should be there or whether only royalty should be given.

Mr. L. J. Robbins: I am sorry, Sir, I do not quite see just exactly what you are asking.

Mr. Chairman: The Model bill provides adequate compensation but our bill provides 4 per cent compensation of the net sales.

Shri Bade: One more factor. The period for which the patent is working *i.e.*, suppose for 10 or 20 years they have taken profit, that period should be taken into consideration while giving the compensation. We said that the highest compensation should be 4 per cent to be granted on the net sale of the product.

Mr. Chairman: What is your objection? Model Law says the amount of compensation is justiciable.

Mr. L. J. Robbins: I just do not think the arbitrary ceiling of 4 per cent is just. I do not think it is fair. I do not think it will encourage inventions in this difficult field. I do not think it will encourage Indian inventors. I have said this before.

Shri Bade: You have said, process-cum-product should be patented.

Mr. L. J. Robbins: I do not think any one in any country in the world, if there is a fair operation and the Controller or anybody else handling this compulsory licensing, deals with it justly in a legal manner and considers all the facts and comes to a fair decision about what the royalty should be, would have any objection; but it should be completely variable and may be much more than 4 per cent or may be less than 4 per cent.

Shri Bade: The question is whether patent should be only for processing or for product. You have said that process-cum-product should be patented.

Mr. L. J. Robbins: Well I think you would be largely defeating your own purpose if you limit it in this field just to processes to be carried out in India without giving any protection to the product at all. That will mean Italy can import the product and the patentee would have no recourse. Is'nt that right?

Shri Bade: In Japan, only processes are patented on the ground that if the product is not patented and only processes are patented, there would be other scientists who will be encouraged and they will find some other process to have the same product.

Mr. L. J. Robbins: That is not correct, as regards Japan. The product is most definitely protected as made by the process and foreigners can sue in the Japanese courts I can assure you. The two things are tied up.

Dr. M. M. S. Siddhu: You have said on page 3—while discussing process and product patent—"therefore there is no basic difference but only a matter of degree, between what are termed 'product' patents and 'process' patents by the uninitiated". If there is not so much of a difference and it is purely theoretical whether a person will be able to come to any other profitable method to get to that product, then why all this fuss at all.

Mr. L. J. Robbins: When I say there is no basic difference, I am naturally assuming that there has to be a competent patent attorney who fully cooperates with the inventor in preparing claims. In Germany, for example, there is a very good example. The whole emphasis is on the product itself. The process can be completely conventional, but you have to prove to the satisfaction of the German Patent Office that your product is new. I am mostly concerned in this field with the complications in the patent Bill itself. The moment you grant protection to the product, it will be quite easy to administer the law, because then it would be absolutely clear.

Dr. M. M. S. Siddhu: A person may produce a drug for limited use, but it is only after long clinical trial it becomes known, that it may have other uses which the inventor never thought of; even then he gets the benefits of patent rights, and the person (physician) who has made its use possible does not come into the field at all. Therefore, in medicine it is not only the inventor but also the physician who plays a vital role. So, don't you think that the medical world does need the benefit of it and therefore the number of years for which a drug should be patented should be different from the number of years for other articles?

Mr. L. J. Robbins: Frankly I do not quite see what this has to do with the patent law itself. I agree that there have been a number of examples where drugs were intended for one purpose and by chance they were found beneficial in other fields, but that is customary. But I consider that at the present time in India your Government's basic concern is not with highly specialised drugs, but with sulpha drugs, antibiotics etc. which are most needed, and for which there is now no patent protection or only patents that expire in a very short time.

Dr. M. M. S. Siddhu: That is not the only thing. Patents are connected with trade names. A doctor is accustomed to write a particular drug. Even after the period of patent is over, he continues to write the same drug, with the same trade name.

Mr. L. J. Robbins: I do not think that this question of trade name really has any relevance to this. Most of these are condensed terms of chemical names, used for general convenience, but Trade Marks are important because they imply a standard of quality. I mentioned previously the problem of Italy having 20 or 30 names for really the same product.

Dr. M. M. S. Siddhu: That problem will still remain if the drug is to be used even after the patent period has expired. What are you going to do to overcome that?

Mr. L. J. Robbins: Yes, but I do not know whether the patent law can solve all problems of human nature and business practices.

Dr. M. M. S. Siddhu: Don't you think that on humanitarian grounds drugs should be treated differently?

Mr. L. J. Robbins: I do not think so because they are products of very intensive research, and it is contrary to basic ideas in this field to differentiate between products of different technologies.

Shri Wasnik: You have said on page 5:

"Clause 13(2) provides for a novelty search of publications in India or elsewhere. But the Indian Patent Office has no library facilities for such searching."

In this context, would you recommend that we grant patents on the trade registration system of France?

Mr. L. J. Robbins: I think that would be a backward step, because on foreign patents coming in here from countries of Europe and America they have to do very little work, but in other cases it would be different.

Shri Dahyabhai V. Patel: As you may know, medical science is quite ancient in this country; the system of medicine known here as Ayurveda is the oldest medical science in India, and it has given to the world some of the drugs which are considered very potent and as a specific for some diseases. For instance, I may name one of them which is used to relieve blood pressure; it is known as serpina.

Shri Warior: Serpentina.

Shri Dahyabhai V. Patel: There are so many other drugs like that. The people of India feel that this is something that can go to the world outside. But India has not been able to get the advantage out of it. These drugs are recognised abroad as very potent all over the world, and India has to purchase the material from abroad. Perhaps they are processed better, and the result is that we have to pay very exorbitant prices. What is the remedy for this? Does the Patent Law provide a remedy for this? Is the present patent law going to help research in this direction and do you think we are equipped for that?

Mr. L. J. Robbins: It was my understanding that these drugs here have been developed through thousands of years of research, and are derived from native plants of India, which grow here in India. Why do you say they are expensive, I do not quite understand.

Shri Dahyabhai V. Patel: Now we are importing some drugs for the relief of blood pressure. Most of them are imported.

Mr. Chairman: It is manufactured here.

Shri Dahyabhai V. Patel: Some of it is manufactured here. The point is, they cost tremendously.

Mr. L. J. Robbins: One of the best now has the trade Mark *Hydro Diuril;* it is a synthetic compound. It is not a natural compound. I did not know that these natural things are imported from abroad.

Shri Dahyabhai V. Patel: The drug is exported and processed and we get it back.

Shri Warior: The raw material is exported.

Mr. L. J. Robbins: In cases where the raw material is available in India, it should be developed as an Indian industry.

Shri Dahyabhai V. Patel: Do you think that the present patent law is going to help this country to conduct research and provide the people with cheap drugs indigenously, or, will we have to depend still on knowledge and research abroad?

Mr. L. J. Robbins: Obviously for the next generation, you will have to depend largely on others. It is not a unique thing for any country. I feel very strongly that Indian research will rapidly improve, but a law based upon this Patent Bill would hinder Indian research itself. Many industries may not know about it, but I can assure you that they can take advantage of it. Owing to the technical nature of the patent legislation, it might take many many years before you could modify it. One should not deliberately run into a bad situation.

Shri B. K. Das: You have mentioned in your memorandum that the legislature as a whole, irrespective of the economic and social pressures which may be responsible for some of the provisions of this Bill, is not yet aware of the purely practical problems of patents. Would you like to clarify this? What practical problems can be there if this Bill is passed into law?

Mr. L. J. Robbins: In the Patent Office itself, I think there are a number of things. We discussed one of them, and that is, if examiners have to examine this all over the world you will have to increase the staff and spend more money and get highly specialised people. You will have to take away from the industry itself, where they have knowledge of languages, German or Russian or some of the European languages. That is one problem. Also, on the whole, these special provisions and restrictions you are putting in impose a tremendous burden on the Controller-General. He will have to have an enlarged staff. Do not forget that you are making him practically equivalent to a judge. He will have enormous economic power in his hands to affect industry greatly which, I think, is giving rather too much power to an appointed official. I am sure that the Patent Office may be greatly expanded in 20 or 30 years. But I feel that there are so many other things immediately urgent in India, and expansion of the Patent Office at the present time seems to be not too practical.

Sardar Daljit Singh: You have referred to a few clauses of the Bill in your evidence. Should we take it for granted that you are in support of all the other clauses of the Bill?

Mr. L. J. Robbins: No, Sir. Quite definitely not. I thought I made it clear that other people and other organisations will discuss this Bill section by section. I have merely concentrated my study on a few sections just to save time. I know what has been said on some of the other sections. I am sure you are going to get very expert, legal, well-reasoned statements on all sections of the Bill that are controversial. I only picked out those features of the Bill which have special relation to my own competence and it would not be correct to say that I am in favour of all other clauses of the Bill.

Sardar Daljit Singh: There is a vast difference in the price of some of the foreign patented drugs and products. For example, vitamin B12 costs like this: its initial market price is Rs. 2 per gram while its subsequent market price is Rs. 40 per gram; streptomycin costs Rs. 19 per gram, while its initial market price would have been just Re. I per gram.

Mr. Chairman: He has said that he is not an expert on prices. Tomorrow we are going to get another witness who is an economist and who can speak on prices. You can reserve that question for him.

Shri Sham Lal Saraf: All is well that ends well!

Sardar Daljit Singh: I want to know whether these high prices are found to affect adversely the interests of the common man in India. I want to know his opinion about it.

Mr. L. J. Robbins: I decline to answer it, though I have a personal opinion on it. But I do not think it will be of any interest. So, I very respectfully decline to give it.

Mr. Chairman: Thank you, Mr. Robbins.

The witness then withdrew.

(The Committee then adjourned)

Minutes of Evidence Given Before the Joint Committee on the Patents Bill, 1965.

Saturday, the 2nd July, 1966 *at* 10.00 *hours.*

PRESENT

WITNESS EXAMINED

Chamber of Commerce of the United States of America, *Washington.*

Spokesman

Prof. Maurice D. Kilbridge.

Chamber of Commerce of the United States of America, Washington

Spokesman:

Prof. Maurice D. Kilbridge

(*The witness was called in and he took his seat*)

Mr. Chairman: We have received your earlier Memorandum which has been circulated to the Members. You have given another Memorandum this morning. Any evidence that you give before this Committee is public. Even if you want to say anything confidential, it is bound to be circulated to our Members. If you want to add anything or explain your Memorandum, you may do so. After your explanation, Members will ask you questions.

Prof. Kilbridge: Nothing I have to say this morning is confidential. The Memorandum you have before you is an elaboration of the earlier Memorandum which I sent two months ago. I would like to refer to it now and to go through it with you before we go to the questions.

Let me introduce myself. I represent the views of the Chamber of Commerce of the United States. I am a member of the faculty of the Graduate School of Business Administration of Harvard University. I have also served as a professor of the University of Chicago and as consultant on industrial development to the Development Advisory Service of Harvard University. Most recently I have served for two years as Assistant Director of the U.S. Agency for International Development Mission to India.

The Chamber of Commerce of the United States, I am sure you know, is the largest U.S. business federation. It represents more than 3,900 indivi-

dual organisations—these organisations being business firms, societies, technical groups of various kinds. The underlying membership in all these groups is about 4½ million professional and business people. I would like to explain that the National Chamber has always favoured the economic and social advancement of developing nations. In its policy declarations, the Chamber has specifically expressed its belief in the importance of the continued freedom and progress of India. The National Chamber has also supported the foreign aid programme of the United States and has in its policy resolutions commended to the State Department development of foreign commerce as part of its foreign aid programme. They have insisted that the private sector should be given every opportunity to flourish, both in the developing countries as well as in the United States.

I would like to start first with a very short summary of the economic arguments for patents before I go into a discussion of the specific problems of the Patent Bill pending and the economic development of India.

As you are aware, the patent system is an institution developed as an instrument of national policy and it is designed to serve the nation's economic interest and as such we believe it should be judged by economic criteria. In the famous Justice Ayyangar Report that we have all read, we have a very apt quotation in which he says that "Patent systems are not created in the interest of the inventor but in the interest of national economy." The rules and regulations of the patent systems are not "governed by civil or common law but by political economy".

Patent Law should be looked upon as something which is essentially, a tool of political economy, designed for the welfare of the nation, its economic and social welfare. So the essential economic argument for patents is that they are needed to provide sufficient stimulus for the working of new inventions by industry. The patent system is based on the assumption that industrial progress is desirable, that innovation is necessary for such progress, but that sufficient investment in new products and processes will not be made if industry cannot recoup the costs and realise a profits for its effort. The simplest, most economical and effective way yet found for society to achieve this is to grant exclusive patent rights in inventions. Through the years various other arguments have been used in support of the patent system. The essential argument in favour of patents is one of social welfare and economic welfare of the nation.

The fundamental point then is that the patent system is designed to serve the economic welfare of the community. It takes its significance from its over-all effect on the economy, which is generally to stimulate investment in new products and processes and it does this by providing a protected market with the opportunity for profit necessary to justify the heavy investment of bringing the improvement to the public. The granting of patent protection is intended to allow the innovating company time to recoup the cost of invention, development and commencing production and unless the period of protection is long enough to make investment attractive, manufacturers will be understandably reluctant to make this investment.

Clause 53(1) of the Patents Bill under consideration, as we all know, provides for a ten year patent term for food and medicine inventions and a fourteen year term for all other inventions, with no provision for extensions. This is a reduction from 16 years in both instances under the present law. There is considerable doubt in my mind that this period of protection is adequate in most cases and this judgment is consistent with the patent laws of other nations of the world which provide, on an average, 17—18 years of patent protection. Also, there is sound reason

to believe that a relatively longer, rather than shorter, period is appropriate in the developing countries. By the time, the owner of a patent considering investment in India has studied the market for his product and the possibility of working the patent successfully and has received all the necessary licenses and approvals, there may, considering these delays and delays in importing plant and equipment, hardly be sufficient time left to set up his manufacturing facilities and start production before the patent runs out and leaves his investment unprotected. It is altogether possible that the manufacturer may decide not to take the risk.

Since the patent system provides the right to exclude competitors from producing identical product or using the same process, it is, in theory, superficially inconsistent with India's economic public policy, which is equitable distribution of wealth and deconcentration of the means of production. I insist, however, this is only a superficial inconsistency. In fact, the degree of economic power conferred by patents is far less than that of monopoly in its usual sense. Owners of patents are not free to fix monopolistic prices or to ignore the actvities of competitors. There are always alternative products and processes and sooner, more likely than later, a superior non-infringing product will be brought to the market. So, a major value of the patent system is that it injects competition of a kind that otherwise would not exist. The threat of new firms with exclusive rights to new technologies compels existing companies to improve upon pain of sudden absolescence. The net effect that the patent system makes is a dynamic, progressive environment in which business must constantly seek technological improvements. Without patents, business is apt to fall into the routine of making the same old things in the same old way. The consuming public is deprived of new products and the rate of industrial development slows. Thus, paradoxically, while the patent system operates in one sphere by the grant of exclusive rights, and anti-monopoly laws operate in another sphere by keeping the channels of trade open, nevertheless in the ultimate objective—competition and avoidance of economic concentration—there is identity of purpose.

Now as we all know, no nation's patent system is perfect. India's patent law is undoubtedly in need of some revision to update it to suit todays conditions, to simplify and clarify its application, and to plug loopholes perhaps. We believe that revision can be achieved without basically weakening the patent system. Since the patent holder is always subject to anti-trust regulations, the public can be safeguarded without weakening patent protection itself.

Let me now turn to the subject of Patents and Economic Development which is the central theme of my presentation. We urge the Committee to support a sound patent law because we firmly believe that a patent law which will enable India to participate in international patent conventions is in India's best economic interest as a developing nation. The rate of industrial investment in India is not such that government can afford to risk slowing it down by inadequate patent protection. Industrial growth during the Third Plan, especially in the consumer goods industries, has fallen short of Plan targets. There are already special risks and burdens enough for the Indian industrial investor, and lucrative opportunities for investment in other and less productive sectors of the economy. Any further burden may lead to a weakening of industrial development.

There is also little doubt that the proposed Patents Bill will tend to retard the flow of foreign private investment into India. The foreign investor must already cope with a high tax structure, expensive and uncertain raw materials supplies—some of which has been alleviated now by devaluation—and burdensome con-

trols and approval procedures (although these are not peculiar to India). If to these is added weak and uncertain patent protection and, I must add, the attitude toward the private sector that the proposed Bill implies, then foreign investors may decide to put their factories elsewhere.

I would wish to underline this attitude toward the private sector implied in the proposed Bill, and this is what has made those in international trade circles feel slightly upset.

In particular, clauses 87 and 88 of the Patents Bill provide that all patents for goods, drugs, and chemicals will be endorsed as "Licenses of right," and that where an endorsement "Licenses of right" exists any person wishing to work the patent in India may require the patentee to grant him a licence on terms decided by the Controller of Patents—not to exceed a four per cent royalty, as we know, on the ex-factory price. These clauses, in effect, virtually deprive the affected industries—and especially the important pharmaceutical industry—of their patent rights, throwing open these patents to any number of applicants without regard to their financial or technical ability to work them properly, and setting a ceiling on royalties rather than allowing for free negotiations based on the merit of the product involved. Aside from the special burden, this places on the drug industry, this abrogation of industrial property rights without court appeal seems to be inconsistent with India's high international reputation for legal process, and cannot but put some doubt in the minds of prospective investors about the future security of industrial investment in general.

Now let us look for a moment at the changing nature of foreign investment in India. I made recently a study of the structure of foreign private investment in India, its sources and the industries into which it is flowing, and I can summarise the following information for you.

There has been a shift in the sectoral distribution of foreign investment in India since independence and because of this the relevance of patent protection to investiment is of increasing importance. There has been a sharp decline, relative to the total, of investment in the traditional sectors of services, plantations and mining; they are receiving very little investment; the collective share of these sectors in total investment has declined from 63 per cent in 1948 to 29 per cent in 1965. This is the position in the traditional sectors of the economy. At the same time there has been a rise in the share of petroleum and manufacturing which together accounted for 72 per cent of foreign investment in 1965, as against 36 per cent in 1948, that is to say, a doubling of the percentage of investment in manufacturing and petroleum. There has also been a re-distribution of investment within the industrial sector. Considerable diversification of investment has taken place in manufacturing where producer goods investment, especially in transportation equipment, metal products and chemicals, has increased strikingly; at the same time investment in the older consumer goods industries, such as textiles, has been virtually constant. Similarly, invesment in the petroleum industry has been more in refining and less in marketing. The typical foreign investor of the future is therefore more likely than not to be a manufacturer in one of the newer branches of industry to whom patent protection is of paramount importance.

It is also interesting to note that repatriation of profits from these newer industries is at a much lower rate than from the older investment sectors. This is because they are growth industries with an eye to the future. They plow back their profits for long-range growth rather than remit them abroad. Reports published by the Reserve Bank of India indicate that foreign investors in petroleum and manufacturing industries are plowing back over 50 per cent of their earnings, while profit reinvestment in the

case of plantations and the service industries averages not more than 10 per cent of earnings. The net effect of the sectoral shift of investment is certainly beneficial to the balance of payments, and this shift can be assisted by strong patent protection. In fact, I would say that strong patent protection should be continued and is essential for the development of foreign private investment.

The net inflow of private investment capital into India has averaged only Rs. 25 crores a year since independence, and, as we all recognize, this a mere trickle as compared to India's needs. The Fourth Five Year Plan probably will set an ambitious target of about Rs. 150 crores a year of net new private foreign investment. To an increasing extent this capital is coming from the United States where it is official government policy to encourage and assist investment in India. In the year 1965 about 21 per cent of India's foreign private investment came from the United States. This compares with only 10 per cent ten years ago. United States private investment in India has grown from about Rs. 48 crores in 1955 to about Rs. 135 crores in 1965. The National Chamber of Commerce has consistently supported the United States Government's policy on private investment in India, and has consistently encouraged and supported its members in making their investments abroad. And we feel it will be easier for the Chamber to continue this support if patent protection in India is not markedly weaker than that in other developing countries competing for United States private capital.

I would like next to comment briefly on Patents and the Transfer of Technology. As important to India as the inflow of foreign capital, is the related transfer of industrial technology. There is probably no single factor, in my judgment, in India's industrial development more critical now than the availability of useful knowledge. I put this as perhaps the most important element of development. And, as is well known, this knowledge is not embodied in patents alone, but involves a great amount of associated information and experience, both technical and managerial. Patent protection, however, provides the incentive for foreign investors to divulge and apply this knowledge in India. Once this knowledge is in use, it spreads and grows through the industrial and technical community. Indian policy and law wisely require the rapid training and employment of Indian technicians and managers in companies employing foreign capital and imported technology, thus speeding the diffusion of useful knowledge. The key to sharing the technical and managerial knowledge, and the access to world markets, enjoyed by companies of the more advanced countries is to attract their manufacturing and research activities to India. And as a very practical matter, social and economic theory aside, I do not believe, this can be done successfully on a broad basis without patent protection at least as strong as that provided by other developing nations. You know I continue to emphasize the comparative patent protection of India as against other developing countries. This, I think, is one of the most important aspects of the present Bill.

Adequate patent protection is, I believe, essential for the development of India's indigenous scientific and technical base. Multi-national corporations have in recent years decentralized their manufacturing operations out of the home country to those countries where they have substantial national markets. This has become the thing to do. You leap-frog the national barriers and establish your manufacturing units in those countries where you have a market. But as you know, research and development activities are still concentrated at home There are very few industries which have made any effort to decentralise their research and development activities. The logical next step in the evolution of international corporations is the decentralisation of research and development. It is just now beginning and this could be of great advantage

to India in that it would provide opportunities for Indian scientists and technicians, and assist the development of indigenous technologies employing domestic materials and suited to Indian conditions. But one wonders if this step will be taken in the absence of adequate patent protection. Will a large chemical company, for example, choose to develop new products and processes in India if patent protection is inadequate to justify their commercial application here?

There is also to be considered the effect of weakened patent protection on India's developing scientific community. It is well known that literally thousands of Indian scientists trained abroad continue to reside there. In the last annual count it was found that as many as 6000 Indian scientists, highly skilled and qualified, reside in the United States; they are employed there. Many of them do not come back, or delay their return, for lack of equally good employment opportunities at home here.

Now, there has been in the past little privately financed industrial research carried on in India; most of it has been, as you know, Government-financed research. Most industrial knowledge that is in use has been imported full blown from more advanced countries. But, as the industrial establishment broadens to include science-based industries, and companies become better established and more mature, we should normally expect considerable growth of privately financed research and development activities. But will this natural evolution take place if the patent system is weakened, or will Indian industrialists consider it more to their advantage to continue to import second-hand technology? What might the effect of this latter course be on India's young scientific community?

Let me take up next the point of the effects of royalties on the balance of payments. This is a vague and difficult subject—one about which, you know, the argument is sometimes raised, contrary to the protection of foreign patentees, that royalties impose an excessive balance of payments burden. This is a difficult point to pin down because of conceptual difficulties and the inadequacy of available statistics. Two facts seem certain, however. One is that royalty payments, are only a minor element in India's unfavourable trade balance, and the other is that the costs and benefits of royalty payments cannot be reckoned in direct balance of payment terms alone.

According to the 1961 Survey Report of the Reserve Bank of India, published in 1964, royalty payments to foreign patentees for the year 1961, which was the last annual figure available, were Rs. 2.4 crores. This is to be compared with a payments deficit (imports *plus* debt service *less* exports) averaging about Rs. 680 crores annually over the Third Plan period. In other words, royalty payments for the year 1961 were only about 0·3% of the payments deficit. When a country's balance of payments situation is as desperate as India's is today, every little bit counts and Rs. 2·4 crores is not to be overlooked. But the question must be asked whether a small direct exchange saving on royalty payments might not result in a much larger indirect loss? This is a hard balance to strike.

Now, the substitution of domestic industrial products for foreign imports depends on India's industrial growth which in turn requires an inflow of technical information and skills. To save foreign exchange on royalty payments at the risk of cutting off the inflow of technology may be to eat the goose that is about to lay golden eggs. It may be penny wise and pound foolish. The same argument holds even more strongly in the case of exports of industrial products. Since exports of the traditional agricultural cannot be expected to increase much or very rapidly because of the severe competition from the other developing countries in the field. So, if India is to raise its export earnings substantially, this increase has to come very products such as tea, coffee, and jute

largely from manufactured goods. Here, India is in a more advantageous position because it has cheap and highly qualified labour. The wealth of technical and managerial knowledge, capital resources and marketing access enjoyed by manufacturing companies in the developed countries makes them formidable competitors in the field of manufactured goods. An alliance with foreign capital and imported technology, an alliance requiring patent protection, is frequently the only practical way to enter the world market in certain industrial goods.

Now, a step in the right direction has been taken in the devaluation of the rupee—a bold and, I think, economically sound step. Let us not now take a step backward by weakening patent protection.

Another argument frequently heard contrary to the protection of foreign patentees is that high prices result from this protection either because the foreign patentee has thus acquired a protected export market in the less developed country or he has acquired a monopoly position in the local market if he decides to manufacture there.

I am told that Mr. Leonard Robbins assured you yesterday that I, as an economist, would deal with this price question. Let me immediately disavow any special knowledge of comparative current prices. My field is industrial economics in general. I know you have questions about cost-price relationships in the drug industry particularly, and these, following the skilful lead of Mr. Robbins, I shall ask you to defer, for subsequent specialists from that industry. I do not wish to dodge the issue. I am saying that I do not have detailed information about cost data and price data to give you at this time and these people, I believe, will have. I can, however, make some general observations. As with the balance of payments question, it is difficult to resolve this question precisely, but I can talk about it in a general way based on my experience in India.

Let me first refer you back to the United Nation's report on "the Role of Patents in the Transfer of Technology to Developing Countries", which all of you I am sure have read. I shall quote a very short paragraph:

> "...the effect of higher prices specifically due to patent protection is almost impossible to disentangle from higher prices due to such factors as exclusive know-how, trade secrets, restrictive practices, or the dominant market position of the supplier, all of which are intrinsically unrelated to the patent system. Since patents are thus only one of the factors which may bring about higher prices, the question arises whether measures directly affecting price levels or general anti-trust legislation are not an economically more effective and administratively more feasible technique of coping with the problem than legislation devoted specifically to the patent system."

Now the existing Indian price control legislation is adequate for direct action if this is thought necessary, and, from what I have seen in the Press recently, I believe that it has been thought necessary. Getting at prices through the patent system would seem to be a round-about approach, and one for which the prospects of success appear remote. There is also good reason to believe that where prices of industrial goods in India are abnormally high, it is due more to government import and licensing restrictions and to the protected market that results from these as well as such things as the high cost of raw materials, the small scale of operations which, in many cases, have not reached the full economy of operation, the low productivity of some of the smaller factories etc; also the high cost of imported machinery and equipment, I believe, in some cases, has raised the cost of manufacture in India.

Although this statement is intended to be of a general nature rather than

the detailed analysis one might expect from a patent lawyer, specific reference has been made to several clauses of the Patents Bill. We ask the Committee not to infer from this that we consider—by "we" I mean the United States Chamber of Commerce—only the referenced clauses to be harmful to India's future economic interests. On the contrary, a large number of the provisions of this Bill are we feel, inconsistent with internationally recognized patent principles, and will be found offensive and discriminating by both Indian and foreign business communities.

In concluding, let me urge the Committee to consider this Bill from the point of view of its psychological effects in world trade circles. This concerns me as much as anything else in this Bill, and it has upset international trade circles; people feel that India becomes, with this patent law, a hard and uncertain p'ace to do business. The Patents Bill may cost India far more in retarded economic growth than it can possibly gain for her in any other way. The retention of a sound patent system that will enable Indian participation in international agreements is, we believe, in India's best economic interest as a developing nation.

Thank you.

Mr. Chairman: Now, members might ask questions.

Shri Kashi Ram Gupta: Does your country make any survey regarding statistics, particularly about pharmaceutical industry, as to how generally research expenses are met and in how many years they are met because the main argument against lowering the years of patent is that the industry may not recoup what it has invested? Is there any survey made in your country about this?

Prof. Kilbridge: The question, as I understand, is whether any survey is made in the United States which shows how long it takes to recoup the cost of research and development in the pharmaceutical industry for the purpose of comparing this with the patent protection time of ten years. My reply is: yes; such surveys do exist. I do not have the data at my finger tips. I am sure that this information will be introduced by witnesses from the pharmaceutical industry. I can give you some general readings on the subject. I do not represent the pharmaceutical industry particularly I represent here the United States Chamber of Commerce and I myself have not worked in the pharmaceutical industry. I am an industrial economist and my experience has been mostly in mechanical industries. But from general readings I have the impression that development costs vary immensely and only when a large number of cases are taken, does the average have any meaning. Some well established companies with physical facilities already available for exploiting the process, have managed to turn a profit in a matter of three to four years; in other cases where the facilities had been poor, it was necessary to build pilot plants and then new full scale industrial plant and they had to work for 12 or 13 or even 20 years to turn a profit.

Shri Kashi Ram Gupta: What is the relation of a scientist with the industry in the United States? Are the scientists regularly paid or do they also get something out of their inventions as commission from those industrial concerns?

Prof. Kilbridge: Typically an industrial scientist signs a contract of disclaimer with the company in which he is employed under which he gives up all patent rights. He receives no direct remuneration. However, the man's progress within the company and his basic salary frequently depend upon the research that he does. Indirectly he may receive something, but nothing directly tied to patents.

Shri Kashi Ram Gupta: In the latest memorandum, you have stated that 21 per cent of foreign investment is American. May I know how much of it is due to such industries which are dependent on patent and how much of it is due to know-how and other factors?

Prof. Kilbridge: I do not think I can answer that question directly. American investment is almost entirely in manufacturing industries.

Shri Kashi Ram Gupta: What percentage of such investment is in patented industries?

Prof. Kilbridge: I am unable to answer that question.

Shri Kashi Ram Gupta: Is, in your opinion, the present Patent Act of the Government of India quite suitable?

Prof. Kilbridge: I believe, the existing Patent Act is comparable to the Patent Acts of other developing countries and, generally speaking, quite acceptable to the American business community.

Shri Kashi Ram Gupta: In the Bill it is written that the period of protection will be counted from the date of completion of specifications which is an improvement and which means actually 16 years. What objection do you have to this particular clause?

Prof. Kilbridge: There is no provision for extensions.

Shri Kashi Ram Gupta: Is it a fact that most of the American investment is at present due to the supply of know-how and not because of patents?

Prof. Kilbridge: It is a very difficult question to answer. In all American financed factories and joint ventures I have visited in India, I think all of them require a considerable import of know-how. I cannot visualise any of them having been done by import of capital alone.

Shri Kashi Ram Gupta: In which of the developing countries the Patent Act at present is more attractive to American capital compared to the Indian Patent Act?

Prof. Kilbridge: The Latin American countries, of course, traditionally, get the lion's share of American foreign investment. This is more due to other factors and not due to the Patent law. On the sub-continent, Pakistan, to use a nasty word, has in the last ten years received a larger percentage of investment of private capital from the United States than India has. This is not, however, because of patent conditions or patent laws. I think this is because of the aggressiveness of the Government in seeking foreign private investments and the concessions they have made to private investments.

Shri Kashi Ram Gupta: Are you aware of the fact that in the last 15 years other European countries have invested more in drugs and medicines here in India than America?

Prof. Kilbridge: I am not aware of that fact.

Shri Kashi Ram Gupta: You have mentioned in your memorandum that research has been centralised up till now. How will you be able to decentralise research if the Patent Act is changed according to your suggestions? Now the research is done there at home. How will you be able to see that the research is done here in India?

Prof. Kilbridge: Some large international corporations I am fami'iar with are now planning a decentralisation of research and development activities. It is well known that one can run a research establishment in India considerably cheaper than one can in the United States. Also, one can use indigenous materials in the research effort. One can also consider manufacturing processes in the development effort which are appropriate to Indian conditions and one

can then develop a manufacturing complex to produce products suited to Indian conditions. American research is conducted on American needs and problems which are not necessarily the needs of India. American research is conducted on the basis of raw materials avai'able in America which may not be available here. Therefore, when we import into India these technologies we necessarily import raw materials which means a continuous drain of foreign exchange for the import of raw materials to run a factory and produce a product which could possibly be made in other ways if the research and development had been started here in India.

Shri Kashi Ram Gupta: So far as research is concerned, it comprises of not only the patent side but also the know-how and technology side. Patent is only a part of it. Therefore, even if the Patent Law is not amended according to your wishes, research can be carried out in this country in a decentralised way.

Prof. Kilbridge: Yes. I think so. The Indian scientists are available. There is no reason why a pharmaceutical company cannot set up a research plant in Delhi and have it as a base for manufacturing new products in India. I think it is coming.

Shri Kashi Ram Gupta: In your country most of the industries are very largely based and they have got their own research establishments which have recurring expenses which are treated as revenue expenditure. These expenses are part and parcel of the whole business and dividends are worked out after deducting these expenses and also income-tax. Therefore, how can this old theory stand, that a scientist who invents should work it out individually and then give the know-how etc? What is the basis of such an argument?

Prof. Kilbridge: What you say is quite true. Most large companies budget a certain amount of money annual'y for research and development programmes. This is considered an annual recurring expense. I do not try to justify patents on the basis of the individual researcher being paid for disclosing his information to society. The argument rests more soundly on the opportunity for the company to recoup cost of research and development. There is an equation in the minds of management between how much they can afford to spend on research and development annually and how the patent protection is allowing them to recoup a certain amount through profits over time. We do not know how long it will take to develop a particular product or process. Research is a very uncertain kind of thing. Many research and development projects are launched and a certain amount of money is spent. Many products are sold; many processes are up-graded and improved and certain profits are made. A balance is struck between what you can afford on one hand and what you receive on the other. This balance is based largely on the country's patent protection. Certainly, if in the United States there is a shift in our patent protection and the period is reduced, we will have to put less money in research and development because less can be supported on the basis of profits. This is what would happen in any country.

Shri Kashi Ram Gupta: There is a model law given for developing countries. I think, you must have studied that model law. This model law contains a note that a patent can be for a minimum period of 10 years from the date of the grant of a patent. Do you agree with that?

Prof. Kilbridge: I have seen the model law but I am not a patent lawyer.

Shri Warior: I only want to ask one or two points. I wish to know your reaction about the protection to process and the protection to process-*cum*-product or product alone.

Prof. Kilbridge: Can you be more specific?

Shri Warior: Under this patent law which we are now considering, we think that the protection should only be given to processes and not to processes-*cum*-products or products alone. What is your reaction to it?

Prof. Kilbridge: I think I am being asked to make a distinction between process-*cum*-product and product alone. The distinction is difficult in some cases and easy in other cases. Sometimes, it is possible to circumvent a patent by achieving the same end by different means. If the product is patented but not the process, this would not be successful. In another case, it is possible to use the same process and turn out a different product. If the process is patented but not the product, this would not be successful It depends on what you try to achieve.

Shri Warior: The object is this. When the process-*cum*-product is patented and patent protection is given, naturally that comes in the way of inventing new processes and new discoveries. Then, that also gives an additional advantage to the original patentee in the form of extension of his same process by adding something or omitting something after the lease of protection for the prescribed number of years is over. That is what is happening thereby creating a monopoly for long periods and precluding others from coming into the field.

Prof. Kilbridge: I see your point. The process can be patented. In an attempt to make the same product by different processes, in many cases, an improved process has been found. It could give opportunity to people for searching for a better way of doing the same thing. In many cases, a search for a new way has been a search for a better way.

Shri Warior: About research, I wish to ask one very simple question. Why is it that under the existing Act, when it is better than the enactment contemplated now, even with all those facilities for research, the foreign investors have not developed research in India so far. Only the products are being imported here and sold in the Indian market. The manufacture of the products of which the know-how is with them has not taken place here. What is your reaction to this from the Indian point of view? You have been here in India for some years.

Prof. Kilbridge: There are many reasons why foreign private investment has not flowed into India more rapidly than it has. I am sure you know them.

Shri Warior: Not investment. I specially asked about research. No research has been done and no manufacturing has been done here. They have been keeping their patent rights with them and importing only the end-products and marketing them here. As you have suggested in your memorandum, you have found out that only in the petroleum industry, the refining and manufacturing is done. But in the pharmaceutical industry and other industries, even now the old system continues.

Prof. Kilbridge: Certainly, it is to India's advantage to have manufacturing done here rather than to have the product imported. It is to India's advantage to encourage foreign investors to bring their manufacturing plants here and to produce products for the Indian market. It is certainly advantageous for India to have research and development done here rather than to have products imported from abroad. But this is happening very slowly. There have been problems within India. There is the question of foreign private investment. You say, under what conditions, you are going to accept it. The Indian view on this has been ambiguous. Sometimes there is a shift in thinking. There is the problem of foreign exchange. Recently, the exchange rate

has been revised. There have been various other restrictions and controls. There have been disincentives to foreign investors for coming to India. I do not think the patent law has had much to do with it. Of course, patents may have had little to do with it in the past, but in future it may be that patents will have much to do with it. According to the trend today in public policy in India, there seems to be a renewed desire to attract foreign private investment. Just at this time we should not, it seems to me, take a retrograde step on the patents front.

Shri Warior: One general question about incentive to private capital Don't you think that such a large population as 49 crores of people is an enough incentive and a more assured market than a patent protection?

Prof. Kilbridge: The market in India, although it is very large, is also very poor. The total population is about 480 million. But the purchasing power is very low. It is still a fairly small market for many things. But I will say that I believe that the strongest inducement that has attracted foreign investment into India has been the potential of the Indian market, which is larger than all of Latin America and Africa combined, and as the purchasing power of the market grows, the manufacturers can see here a tremendous propensity to consume and they would like to serve that market.

Dr. C. B. Singh: On page 2 of your original statement, you have mentioned in para 1 that the Patents Bill 1965 as it now stands is a harsh and discriminating instrument, and that in the long run it may hit industrial development, retard inflow of foreign private investment and impede transfer of technology from industrially advanced countries. These are your words. Don't you think that these are very harsh words? May I put it to you that the comments by you are rather harsher from that point of view?

Prof. Kilbridge: I don't think in my new statement, written some two months after this, that I have reused the words "harsh and discriminating". However, I don't retract them.

Dr. C. B. Singh: I am glad you have modified them. You have got to remember that in our country, we are developing our own industrial policy and it is not a capitalistic country like the one which you represent. We have got our own democratic socialism. So our patent system has got to be on that main basis of socialistic democratic set-up. You have been here for more than two years and you know that this is a very poor country. Under these circumstances, do you think that the present patent system is more useful as compared to the new one and that the new Bill that we have brought forward is not desirable? That is what you think?

Prof. Kilbridge: Yes, I think that the proposed Patents Bill is less desirable than the present patent law. India is a very poor country. This is why economic development is very essential to the country. Industrial development will depend, not entirely, but to a large extent, upon foreign capital and foreign know-how. That may be seen from the history of all developing countries. Even America, for her industrial development, imported British capital and British knowhow.

Dr. C. B. Singh: My most important point is about pharmaceutical and chemical industry. I am concerned mostly with that. Most of my friends here are mostly concerned with high prices for these pharmaceutical drugs. You probably know that we have got a very important public sector here where we have invested more than Rs. 2,500 lakhs in three important projects at Madras, Rishikesh and Hyderabad. Do you still believe that the patent system should be more strict keeping in mind that we have such a big public sector project where we are, before long, likely to be self-sufficient in the pharmaceutical drugs?

Prof. Kilbridge: I fail to see the connection between the size of the public sector and the need for patent protection, unless it is envisioned that at some time in the near future, the entire food, drug and pharmaceutical industry and chemical intermediates will be in the public sector. . .

Dr. C. B. Singh: No, that is not the idea I am not suggesting that, as we are going to encourage the private sector as well. The point is, in view of this large public sector and a still larger private sector, will it serve our purpose if we have a separate section altogether dealing with pharmaceuticals and chemicals. The present Bill has sections where it deals with pharmaceuticals and chemicals along with food as well. Will it be all right from your point of view if we have separate sections altogether dealing with pharmaceuticals and chemials and food drugs?

Prof. Kilbridge: I am not a patent lawyer and I just do not know the omplications involved in the administration of two patent laws, one covering pharmaceuticals and chemicals and one covering other drugs. This kind of question may be referred to patent lawyers who are specialists in the administration of patent laws.

Dr. C. B. Singh: One more point about the right of appeal. In our patent Bill, there is no right of appeal beyond the administrative machinery given by the Government or the Drug Control Act. You have not said much on that point. What is your view on that?

Prof. Kilbridge: I think I have pointed out in my testimony briefly that it seems to be inconsistent with the general Indian policy of judicial appeal and that it seems to be rather an arbitrary way of deciding an issue. More consistent with the Indian democratic processes, it seems to me, would be an appeal board and an appeal judge of some sort or to put these issues into a judicial channel.

Dr. C. B. Singh: Now it is common knowledge that hardly much money has been invested in research in this country either by the private sector or even by Government. Do you think that a strong patent system is likely to attract more capital for industrial development?

Prof. Kilbridge: I think that, in general, a strong patent system has the effect of encouraging research and development and that therefore, there would be greater investment in research and development.

Shri M. L. Jadhav: How many patents does your country hold in India and how many patentees are manufacturing their products in India?

Prof. Kilbridge: I do not have that information.

Shri M. L. Jadhav: Do you agree the price of patented medicines in India is much higher as compared to the international price of the same medicine?

Prof. Kilbridge: I do not think there is such a thing as an international price for a given drug. It must differ from country to country. My own experience after living here for two years is that the retail price of drugs in the chemists in Delhi is cheaper than they are in Chicago or Washington.

Shri P. K. Kumaran: On page 7 you say:

> "My experience in India during the past two years convinced me that, although the cost of basic drug manufacture was higher in India than in the United States, mostly because of the higher cost of raw materials and the uneconomical scale of production, still consumer prices were lower."

Have you got any factual data on the basis of which you arrived at this conclusion?

Prof. Kilbridge: This is purely a personal observation. In the presentation of my testimony for the record,

I did not give that statement. Not because I had changed my mind, but because I had made a personal observation and I had nothing to support it. I have no survey or extensive data to support it.

Shri P. K. Kumaran: During the years immediately following the first World War, The American pharmaceutical industry which was in a lower stage of development took full advantage of the patents registered by Germans in that country and developed the industry. If so, do you think the Indian industry should be denied such an opportunity of utilising the well-known formulae, etc. and developing?

Prof. Kilbridge: I am not familiar with your observation about the behaviour of the US drug industry after the first war. As I said, I do not represent the drug industry here specifically. I represent the United States Chamber of Commerce. I am not familiar with your observation and I have no comment to make on it.

Shri Peter Alvares: You had argued from the point of view of technological development as well as industrial finance. A reference has been made here to the particular political economy that our country wants to evolve and develop. In this context, various political economies are being responded to in different manner. Developing economies are now coming together under an Asian Development Bank in which developed nations are investing. Again, the UN has asked all developed nations to pay 1 per cent levy upon their national income. If the responses are so varied, why is it not possible for the foreign investor to consider developing the industry in India by even permitting the abrogation of the patent law as was done in Russia and Japan until they developed their own industry?

Prof. Kilbridge: Unfortunately the individual industrial investor looks upon his investment as an opportunity to make profit in the long run. His social instincts, although they may he highly developed, are I believe, secondary to his instincts as a businessman; whether he is a foreign investor or Indian, the basic motives are the same Accepting these motives, we have got to ask ourselves, is a mixed economy such as India going to be successful in developing industrial enterprise if they refuse to acknowledge the motives of free enterprise?

Shri Peter Alvares: You have talked about the incentive for foreign investment. The Reserve Bank of India Bulletin for May, 1965 reveals that the investment of both the UK and USA in India drew the largest profit in India than in other developing countries and even in the investing countries, i.e. U.K. and U.S.A: So far as UK's investment is concerned, the profit in India was 8.8 per cent, all other countries average 7.9 per cent and domestic, i.e. in UK itself 7.8 per cent. Similarly for USA's investment, in India the profit was 11.9 per cent, all other countries average 10.2 per cent and domestic, i.e. in USA itself, 9.1 per cent. Therefore, it is not proper to argue that there should be a proper climate created for investment by maintaining the old anachronistic patent law.

Prof. Kilbridge: Are these profits that is, profits after deducting all taxes?

Shri Peter Alvares: In one case, it is net profits. In the other case, it is profit on investment. Whatever it is, the ratios are similarly worked for the different countries.

Prof. Kilbridge: It is difficult to compare the profit margin from country to country, from industry to industry. I have one set of data from the Reserve Bank of India and another from the Commerce Department of the US. I have tried to work

drugs in common use in India about 100 of them enjoy patent protection.

Dr. C. B. Singh: Even less than that.

Shri Bade: I am just giving an average and about 800 do not enjoy any patent protection. Now what I have been trying to find and I would like the witness to answer is: What percentage of this profit as included in the Reserve Bank Bulletin could be attributed to the patented medicines because after all out of 900 only one hundred have got patented protection. Now what is worrying our mind is that so far as the other medicines are concerned the average profit may be low but so far as the patented medicines are concerned the profit to us appears to be unreasonably high and as a result of the very high prices that the patent products are in a position to command the average profitability from the medicine and pharmaceutical is pushed up. This is what the feeling is, that is, because we have not been able to get any data separately of the profitability of the patent products from the non-patented products. Now that being at the back of our mind we feel that even if we weaken the patents system in this country it will not very much effect the returns on the capital investment in the medicine and pharmaceutical industry and, therefore, it will have no effect even if it has marginal effect, on the inflow of the foreign capital. If the witness could enlighten us on the point probably it will go a long way to remove our doubts.

Prof. Kilbridge: As far as specific knowledge of cost-price relationships in the medicine and pharmaceutical industry is concerned, you must please rely upon the witness from that industry who will be coming up next week. I would, however, argue we should not look at the return on investment as the sole criterion for attracting foreign capital, as the return on investment in under-developed countries is only one of several criteria. There are other factors like political climate, social and political stability, the difficulties of doing business, the idiologies of Government, etc. These are things which also greatly influence foreign private investment, and return on investment is only one among them.

I have some information about drug prices in U.S.A. which shows that, as a matter of fact, the patented drugs have shown a consistent drop in prices in U.S. in the past few years. Let me read this news release disclosed today. It shows prescribed drug manufacturers have been holding the line of price in arresting the nationwide inflationary trend. Figures during 1965 show a drop in wholesale prices for prescribed products on average of 1 per cent annually since 1961. Drug products covered by patents have shown an even more consistent drop of 8 per cent during the same period. It is a fact which belies the recent criticism in that under the modern patent system non-patented drug items have experienced an increase slightly more than 2 per cent. This again is a bewildering statistics to those who argue that the patent system is causing increasing prices. But again I would beg of you to ask this question of the drug industry people.

Shri M. R. Shervani: I am sure that the intention and the motive of the Inian Parliament while enacting this is not to retard industrial growth. Sometimes, we enact these to stimulate industrial growth and sometimes to restrict social evils.

In this Bill regarding patents, an effort has been made to plug the loopholes and to improve upon the present law. In your opinion, this new Bill weakens the existing law. As far as I can see, there are two points to which most vigorous objection is being raised. One of them is the shortening of the period.

I personally feel that it is in the interests of industrial growth because if you shorten the period of patents, then two or three years more are given

to others to be able to set up those industries, and that will stimulate industrial growth in our country.

The other point is about the compulsory licensing. Here, I want to understand from you what the fear of the foreign investors is. For, as an economist and as an industrialist myself, I know that merely owning the patent or the process is not enough for anybody to be able to put up the industry, because technical know-how is much more important than the patented process, and I, for one, would never attempt to invest my money or encourage others to invest their money on the starting of an industry, merely because I happen to have the patent or those others have the patent. Unless and until I have the technical know-how and the assistance etc. which would be required from the originator or the inventor of the patent, I would not attempt to start an industry. I must rather go out of my way to give him whatever he wants in the shape of royalty and so on so that I may ensure the smooth working of my factory.

This provision that has been made here is for the purpose of restricting the evil of exploitation by a greedy patentee who would not grant a patent just because a competitor has come into the field. In such a case, the Controller of Licence will certainly examine the technical ability, the financial capability etc. of the person concerned, before giving the licence. As regards the fears that you have mentioned at page 4 of your memorandum, namely that if this compulsory licence is given, then any number of applicants could have the licence, I would submit that certainly and surely, no Government would like to waste the internal capital by issuing licences to half a dozen people or a dozen people without ascertaining their technical and financial ability to set up the particular industry.

I want to know from you what specific fears the foreign investors have in this regard, for, to my mind, these things are not only in the interests of the country and in the interests of industrial growth, but they are also in the interests of the foreign patentee or inventor; they do not harm the foreign patentee or the foreign investor in any way, because in spite of the process being known, somehow most of the industrialists would like to have collaboration. And we do have already collaboration in our country in fields where there are no patents. For instance, take the petro-chemical industry, and several other industries where there are no patents. I have myself started a dry battery industry where there are no patents, but I have collaboration with a British firm and I am paying royalty to them, because I want to have a smooth working of my plant and also quicker production.

So, what is the fear that you have in your mind?

Prof. Kilbridge: I must say that I am sure the Indian Parliament has no desire to frustrate industrial development and that this patent law is introduced not for that purpose, and that this is the farthest thing from your minds. But I have a fear, however, that we may be doing the wrong thing for the right reason, and no matter how good the purpose of the Bill may be, it may serve just the opposite end.

To argue that since a patent can be worked easily without the needed know-how and management techniques and that, therefore, a patent itself has no meaning is really to argue against the patent system *in toto*. A patent, admittedly, is a necessary and not a sufficient condition for manufacture, but it is necessary.

Shri M. R. Shervani: What remedy would you suggest against a patentee who does not exploit the patent over a reasonable period of time? If you object to our clause, then what alternative remedy would you suggest against this evil of exploitation for

personal profits for a longer period than is reasonable?

Prof. Kilbridge: The licence of right to my mind creates the possibility of too many manufacturers starting production on less than an economic scale and competing for a limited market and for limited raw materials.

Shri M. R. Shervani: I am sorry I have not been able to follow your answer.

Prof. Kilbridge: The question asked previously was why there should be objection to the licences of right in view of the fact that Government would not be likely to license a person who is not capable of producing and who does not have the funds, the technical skills and so on.

Assuming that the provision is properly administered and that everybody who applies for a licence of right and is so granted one can indeed produce efficiently and does have the capital to do so, then there may be too many people producing the same item. To resolve this, I would like the economy of operations to be kept in view. Larger factories can generally produce things cheaper than smaller factories. So, we have both the cost-price relationship and also the economy of operation in economic development as criteria in trying to decide whether we should allow controlled monopoly for the purpose of economy of production or whether we should allow competition for purposes of economy of production.

Mr. M. R. Shervani: The basis of private sector is competition. So, the private sector is not afraid of competition. On the other hand, the private sector welcomes competition, because thereby the quality improves, and the costs are brought down and production increases. The U.S.A. certainly would not favour controls and monopolies. You have a free economy in your country where you compete, and you are progressing through that system. So, where is the fear if too many people start producing the same product?

Prof. Kilbridge: If the system were totally free and open then the fear would not exist, because then the market would handle things. But in India where there is a controlled economy and a planned economy, the private sector really does not function or operate as dependent upon the market but as dependent upon Government. A man who has a factory running on one shift, if he sees a competitive licence issued to somebody else to set up a similar factory and run one shift in competition with him, when his factory requires operation on two or three shifts, in unfairly treated.

Shri M. R. Shervani: But you have not answered my question. My point is this:

In the present law, we have given a certain limited period for exclusive exploitation of a patent, and now we are seeking to reduce that period by two years or four years in the case of drugs and medicines. My question was: What alternative remedy would you suggest to prevent the evil of exploitation for a longer period than what we have suggested? We say that if a patentee does not start manufacture but is exploiting it by import of the patented product, then compulsory licence will be given to anybody who is capable of producing that product. We do allow a patentee to exploit his invention or his product for a certain period, and it is only after that that the Government of India would give or grant any compulsory licence.

If you do not approve of that, then what alternative suggestion have you got to prevent this exploitation for a longer period than is allowed in the Bill?

Prof. Kilbridge: Talking to the narrow point of what should be done about a patentee who daes not exploit

his patent and who prevents it from reaching the market, and to that point alone, I would say that there are several examples in international patent law that we could follow. I have no particular argument for any one of these, but I do sympathise with the position that the patentee who has no desire to work his patent may have his patent revoked or cancelled.

Shri Balkrishna Wasnik: In your statement at page 7 you have stated that the existing Indian price control lagislation is adequate for direct action, if that is thought necessary. Could you elaborate this statement?

Prof. Kilbridge: We have had price controls in India on pharmaceuticals, since, as far as I can recall, about the middle of 1963. Controls were introduced under the Defence of India Rules. I understand the Defence of India Rules in respect of control of drug prices is no longer applicable, but that a new way of achieving the same thing through an extension of the Industrial Resolution, or some such instrument, can be used for continuing control, and, in fact, has been, or is about to be used, for the purpose of continuing the control of drug and medicine prices. This is a direct way of controlling prices. Considering all the factors that go into drug prices, the patent is one of the smallest, and you cannot control drug prices directly through patents.

Shri B. K. Das: You say that 4 per cent royalty is not adequate, and that it should be settled by negotiation. Can you give me an idea as to what generally is the percentage allowed in such cases?

Prof. Kilbridge: It varies all over the place. Usually it depends upon such things as the value of the product, the size of the market, the number of those licensed etc. Preliminary royalty rate may decline with time very rapidly; it may be 8 per cent for the first year's production, declining to 2 per cent after ten years. So, it is impossible to generalise on it. The argument here is less aimed at the amount of percentage than at the principle of control.

Shri B. K. Das: But can you give the maximum percentage?

Prof. Kilbridge: There would be a limit beyond which the manufacturer would not get any benefit. That would be the maximum.

Shri B. K. Das: You have also said something about appeal to the court. Would you like if the appeal is to a special tribunal?

Prof. Kilbridge: I would think that it would be more consistent with the way you do things in India to have a tribunal.

Shrimati Sharda Mukerjee: About balance of payments you have said that if Indian private capital can have an alliance with foreign capital, we can thereby enter the world market, but we find that on the contrary some of the agreements are such that we are precluded from certain world markets either because of international trade agreements or because the companies with which agreements have been arrived at have put these restrictions. How then do you think that this will give India access to world markets? What world markets are you thinking of specifically, because international agreements, the European Common Market etc., would preclude us from those markets. There is also the Atlantic Agreement between America and Britain. So, which particular market have you in mind, and would the purchasing power of these markets which you are thinking of be really of any substance to India?

Prof. Kilbridge: The markets I have in mind are the markets of Southeast Asia and Africa more than the Continent or Western countries. This kind of agreement in which a collaborator is starting a factory with an Indian investor, giving him the patents, the

knowhow and so forth but precluding the possibility of his selling anything abroad, so that his own export programme from the United States and other countries is not affected, is . bad thing, and I decry it, and I hope that in future you would not go into such things, but enter only into such agreements which not only permit export of a certain percentage of the products but require a certain percentage of the products to be exported and thus put the burden for managing the export on the foreign collaborator.

Shrimati Sharda Mukerjee: Justice Ayyangar, at page 11 of his report, has made the following pertinent observation:

> "These patents are taken out by foreigners not in the interest of the economy of the country, but with the main object of protecting an export market from competition from rival manufacturers particularly those in other parts of the world."

Therefore, it is in the interests of India to have this sort of patent law which would ensure security for her own manufacturers. Because the previous Act was unsatisfactory, these modifications have been made. I do not quite agree with this point you have made regarding the effects on our balance of payment situation, because as things stand at present, I do not think if we enter the international market we have a better chance than with collaboration. As far as the Asian markets re concerned, there also there are limitations.

Prof. Kilbridge: As far as entering the world markets is concerned, one reason why in many cases we have to have foreign collaborators is to ensure efficiency of production, quality of the product and international standards of products. It is extremely difficult for an Indian manufacturer who has not had the experience of meeting these standards to meet them by himself, to rise above the environment, as it were, to turn out a product of good quality. The point about the protected market abroad for the foreign manufacturer, into which no one else can export if he has a patent, is telling. It is for this reason that I would urge India to insist on bringing the manufacturing facilities to this country and get the full advantage of the patent in terms of having the factory here.. To do that, we have to set an environment which attracts the foreign investor. The patent law is only one small part of the whole thing.

Shrimati Sharda Mukerjee: May I put it to you this way? If your foreign capital were to come to India on fairly remunerative terms, you would probably have a much better chance in the Asian market also.

Prof. Kilbridge: Yes, I believe so.

Shri Shyamnandan Mishra: The economic basis of the learned witness for growth and development is quite clear His whole approach seems to be based mainly on considerations for attracting private foreign capital. That being so, one is naturally tempted to ask whether any study has been made in the United States, anywhere, to indicate the extent of correlation between the inflow of private foreign capital and the patent rights granted; if so, we would be very grateful for getting the results of such a study.

Prof. Kilbridge: There have been some studies made, both through our Department of Commerce and the Business Council for International Understanding. I see that one of the witnesses who is going to be here next week is professor Meagher, who was with the Business Council for International Understanding and who I believe, conducted such a study. He considered not only patent protection but other factors as well and I would urge you to bring this question to him. I think, he will be able to help you. I can myself search for it and I can also refer it to him as I know he will be more able to put his hands on it than I.

Shri Shyamnandan Mishra: You have been very kind to give us very valuable information about many aspects of the working of our economy, but you were not able to give the information sought by an hon. Member here as to how many American patents based on the 21 per cent of the total of the private foreign investment here were working, but, surely, you would be in a position to give us some information about the working of patents in your country. How many American patents and how many foreign patents are working in your country at the moment?

Prof. Kilbridge: I can guess, but I am sorry I just do not know the specific number. I am an economist not a patent lawyer.

Shri Shyamnandan Mishra: Would you be able to send it on to us?

Prof. Kilbridge: I can search out the information for you.

Shri Shyamnandan Mishra: According to you, the proposed Bill seems to be of a restrictive nature. As a natural inference from this one would seem to think that the present law is more liberal in character. That being so, one would be entitled to think that on the basis of the present law there should have been a more liberal inflow of American or foreign private capital here. If the present law is allowed to stand as it is, do you think that there would be a better picture; if so, why did the better picture that you portrayed before us not materialise in the past? You have indicated that the total foreign private investment projected for the Fourth Five Year Plan is of the order of Rs. 150 crores a year or something like that. We had also projected in the Third Five Year Plan total foreign private investment of the order of Rs. 300 crores, that is, about Rs. 60 crores a year, but that did not materialise with the present patent law. Therefore, would you kindly indicate how you think that there could be a more hopeful picture in the future if the present measure did not come about?

Prof. Kilbridge: As we all know, the patent law is one of many factors in the investment climate of a country. It is not the most important; there are other factors more important. These factors have in the past added up to a chancy, uninviting, climate for investment in India. It has changed from time to time this way and that, but *in toto* the investment climate in India has been barely acceptable; it has not been good. That is why foreign investment has not come in very fast. If we worsen the climate, we will get less foreign investment and if we improve the climate, we will get more foreign investment. There are many ways to improve the climate. Some things are being done right now to improve it. I can see them happening, even in the press. The Patent Bill is contrary to this trend. We can improve the climate for foreign investment in various ways and we can, at the same time, weaken patent protection. These could be offsetting elements.

I personally strongly believe that India should try to increase this inflow of foreign private investment. I think, it can do this with its present form of social democracy and planned economy. I do not think it is inconsistent with a socialistic pattern of development. I think, it is essential to bring in foreign capital. I just do not think that the balance of payments problem is going to be solved in the long run by foreign government loans. The interest burden on these loans alone is becoming formidable. India has got to find foreign exchange which comes in from the private sector. To do this we have got to make the finest investment climate we can make consistent with our principles.

I think, the patent system that India has now is consistent with these principles. It meets international standards. I think, the Patent Bill proposed is harsher than the patent laws of

other competing countries and cannot have anything but a detrimental effect upon the flow of foreign investment into India. I do not think that by any means the new patent law is going to hasten foreign private investment; it is going to slow it.

Shri Bibhuti Mishra: On page 3, line 5, of your statement today you have said:—

> "Owners of patents are not free to fix a monopolistic price or to ignore the activities of competitors."

Then, on page 6, last line, you say:—

> "As with the balance of payments question, this private question is difficult to resolve precisely."

What do you think to be proper to fix reasonable price in India?

Prof. Kilbridge: The meaning I had in mind in the statement on page 3 is that a patent does not grant monopoly in the sense that "monopoly" is normal'y used by an economist, in which you have one suppier and he has control over the market and the price the market will have to pay. There are competing products and competing processes for any patent and no patent is immune to new research and new development which can produce a newer and better product on better processes. So, a patent owner has a limited kind of protection and a limited kind of control during the period.

Shri Bibhuti Mishra: Monopoly means monopoly control. When one has got a monopoly control, we have a control for the prices, and when the price is controlled, the poor will be suppressed.

Prof. Kibridge: We have also, as I mentioned earlier, the alternative use of price controls; the Government of India has very successfully used price controls in the past and, if necessary, may utilise it in the future.

Shri Bibhuti Mishra: Somewhere you have mentioned that the USA charges a profit of 10 per cent. I think a ten per cent profit is too high.

Prof. Kilbridge: I think I have been fortunate enough to escape that indiscretion. I do not think I have put in profit figures.

Shri Mehrotra: The prices of some of the drugs and medicines in America are less than those charged in India. In India the prices are more than those available in America. What will you suggest in order that the drugs may be available at a moderate price in our country?

Prof. Kilbridge: I do not have specific information of comparative prices, especially of medicines and drugs, as charged in India and in other countries or any cost of production figures. We have to refer to the Industry people who I understand have made a scrutiny and several surveys of the cost structures in other countries. I do not know that we should start with the assumption that the prices of drugs and phamaceuticals to the patient in India are higher than they are in other countries. In my own experience, I found that the prices of certain drugs which I purchased while in India, for my children, were cheaper than the price in Chicago where I was previously. I think the industries people will be able to answer the question.

Shri Mehrotra: Some of the life-saving drugs are sold at a very high price in India and they are imported from foreign countries. Will this Bill be helpful to get those drugs at a cheaper price?

Prof. Kilbridge: I sympathise completely with the feelings of this body which has a strong desire to reduce the cost of medicines to the poor. I think it is essential for the Indian way of life and the Indian way of doing things, to make it possible for every man to afford the drugs that

he needs. I do not think that the patent bill is the best way of doing this. I think there must be more efficient ways of doing it.

Shri Sham Lal Saraf: The hon. witness represents the Chamber of Commerce in the USA. I want to combine three things in one question. Three things are discernible from the Patent Bill. Firstly, we have very poor knowhow, and certainly we cannot progress unless we can get the know-how and import it. The question is, on what terms can we do that. I would like to have your advice on that. How can we encourage the knowhow to come into this country at what is called a reasonable cost? Secondly, how can that contribute to our further knowledge and further research on the subject so that indigenous knowhow will also grow here? Thirdly, about the drugs and chemicals needed in the country, there is no scarcity for them, and we get them at a reasonable prices. Keeping that in view, as far as the provisions of this Bill are concerned, don't you think that these provisions, if they are kept as they are, will be conducive to fulfil all these objectives that we have before us?

Prof. Kilbridge: Let me reply to the first two points, and then ask for a restatement of the third one. The first question was, what is the best way to attract foreign knowhow for industry. I think the answer is obvious: capital. We have to throw money and knowledge and heart and skill all into it. Buy knowhow through collaboration; I do not think it can be done well without capital. Technical assistance and agreements that bring only foreign technicians to assist an industry are, I think, a flimsy way of attracting technical knowhow. The best way is the way that India is generally trying to do it: by bringing in foreign capital with collaboration agreements with Indian capital, and insisting on the training of Indian technicians and Indian managers by the foreign technicians; by insisting also that as much of the research and development work that can be done in India should be carried out, here, so that the company develops an integrated business complex, as autonomous a group as possible within India, rather than a branch of a company which sends its research results abroad. I would like to see the growth of industry in the way I suggested. It has to capture the knowhow so that the people are trained and are made available to other companies as they move around within the industrial community and develop skills in a variety of different stations and circumstances. I think it is essential to do this.

Shri Sham Lal Saraf: From your reply I find that you have combined both the knowhow and the importation of capital. Cannot this be separated?

Prof. Kilbridge: They can be separated. I think it is an expensive way of doing things. We could start a factory in India without foreign capital, by using public loan money, or with free foreign exchange. We can hire a group of foreign engineers to come here and set it up for us and show us how to operate it.

Shri Sham Lal Saraf: The first question is, importation of knowhow; then there is the question of capital. It is up to this country to get that. Or, if the collaborator gets the knowhow and is able to manufacture the medicines on his own, well and good. If not, one may enter into collobora-tion. Do you agree to separate the two? These are two separate issues. Secondly, we have to get the knowhow and make the results available at a reasonable rate to the vast population. For this purpose, there are provisions in the Bill fixing the duration of a patent and the rate of royalty to be paid to the patentee. Do you agree with those provisions?

Prof. Kilbridge: As I said before, the royalty rate should depend on the circumstances of each case and is not definable in advance.

Shri Sham Lal Saraf: The Bill provides the duration of a patent shall be 10 years. Do you agree to that?

Prof. Kilbridge: 10 years is, I think too short a period for two reasons. It is inconsistent with international standards which are about 17 years on the average. Secondly, 10 years is not long enough in many instances to pay back the cost of research and development and setting up manufacturing facilities in India.

Shri Sham Lal Saraf: What about royalty?

Prof. Kilbridge: That should be negotiated in each case.

Mr. Chairman: In page 1 you have said:

> "The patent system is an institution developed as an instrument of natonal policy to serve the nation's economic interest."

That has been the guiding principle of USA also?

Prof. Kilbridge: I feel that the patent law. Why should you object the nation's economic interests in the long run.

Mr. Chairman: Earlier your country took some decisions regarding the patent law. Why should you object to those provisions being made in India now? Ours is an under-developed country. I hope you have read the Ayyanger Report. I shall read out one passage from there:

> "Mr. Langner giving evidence before the Temporary National Economic Committee of the USA which was set up in 1941, speaking of the American Patent system said:
>
> "Patents are taken out in foreign countries (by Americans) for two main reasons. One is that we are doing business abroad and we want to protect our article, so that the German manufacturer or the English manufacturer is not able to copy it immediately and go into competition with us. In other words, it is a great selling point for our goods to have a protected inventive feature and we have kept ahead of the whole world in the export markets through our patent system".

Again, Edith Penrose in his study entitled "The Economics of the International Patent System" has said:

> "No amount of talk about the economic unity of the world can hide the fact that some countries with little export trade in industrial goods and few, if any, inventions for sale have nothing to gain from granting patents on inventions worked and patented abroad except the avoidance of unpleasant foreign relationship in other directions. In this category are agricultural countries and countries striving to industrialise but exporting primarily raw materials—

Ours is such a country—

> "Most countries have little if anything to gain economically from granting patents to foreign firms; and they do so partly because the ideals of 'international cooperation', 'non-discrimination' and similar laudable statements have been influential in shaping the thoughts of lawyers and statesmen."

I have quoted from your own country. Do you agree with these views?

Prof. Kilbridge: I could hardly be expected to agree with the total picture.

Mr. Chairman: Is that because yours is a fully developed country and ours is an under-developed country?

Prof. Kilbridge: No. Indian interests should come first and no Bill should be passed on the basis of pleasing a foreign power. My interest in seeing that India has a good patent law is so that India attracts foreign investment which it needs for rapid economic development. I

worked for 2 years for our A.I.D. mission in which position I was largely responsible for the loan programme to India. I believe fully in Indian development. But I take a realistic view. I do not think public sector projects are enough for India's development. Foreign private investment is necessary and you do not get it merely by pleasing the Government of a country, but by pleasing the bussinessmen in that country. One way of looking at the American patent system is that the American patentee is trying to prevent competition in the Indian market from other freign producers. Another way of looking at it is India is benefited if we can attract his factory to India instead of merely importing, the product and putting up barriers against other products coming in.

Mr. Chairman: This committee is prepared to give reasonable protection, but for for extortion.

Prof. Kilbridge: No country should give protection for extortion.

Mr. Chairman: According to the report of the Reserve Bank, certain patented drugs are sold at 400 times the price. Is it not extortion? I can give certain examples: Gross profits after tax come to 14 per cent, 16 per cent, 17 per cent and so on.

Prof. Kilbridge: Then we have the super tax, tax on dividends, or remittances made, and so on.

Mr. Chairman: The main object of the patent law is to start manufacture in the country and to promote research. Suppose a patentee does not start a factory to manufacture it here nor does he have any research institute here. In such cases, if compulsory licences are given after three years, why should there be any objection?

During those three years he has got monopoly for importing the products and selling them at exhorbitant prices. What protection can the country have against that?

Prof. Kilbridge: I think the patent should be used or it should be revoked after a period of time. otherwise I can see no advantage to India. When the country is providing all conditions necessary for manufacturing the product within the country, one should expect the foreign manufacturer to set up a factory in that country. If under the conditions made available he can make a reasonable profit, he should set up the factory in India and manufacture the items here.

Mr. Chairman: We have no more questions to put. Thank you very much for coming and giving valuable information to the committee.

(The witness then withdrew.)

(The Committee then adjourned.)

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Monday, the 4th July, 1966 *at* 09.55 *hours.*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

I. Verhand der Chemischen Industrie E. V., Frankfurt am Main (Association of Chemical Industry in West Germany).

Spokesmen

1. Mr. Georg Albrechtskirchinger.
2. Dr. Ulrich Heubaum.

(The witnesses were called in and they took their seats)

Mr. Chairman: The evidence that you give is public and will be printed and published and placed on the Table of the House. It will also be distributed to the members of the Committee. If you want any part of your evidence to be confidential, it will be printed and distributed to the members of the Committee. Your memorandum has been circulated to the members of the Committee. If you want to add or supplement anything, you may do so. Otherwise, members will ask questions.

this sort of protection was offered to all foreigners—anyone in the world—who wanted protection of their intangible property rights in Germany. No discriminatory measures were taken in regard to applications, for cated German property during the example, made by nationals of countries whose governments had confiswar or as a consequence of the war. The fact that Germany right after its defeat provided a strong patent protection at the time when the country was still in ruins encouraged the inflow of foreign technology, capital and know-how and relatively quickly Germany could again come to the basis of exchange of ideas and technology and re-tie the old links that had existed before the war because the foreign companies felt at ease to operate in Germany under those conditions of patent protection; they felt at ease to grant licences, to make known their know-how and very soon a very intense technological co-operation between Germany and a great many countries began.

As you very well know, now Germany has rather intense economic and industrial contacts with a great many countries, not only with industrialised nations but also with a great many countries which are in the course of industrial development and among those countries, fortunately, is also India.

In this connection, after this introduction, I might want to make one reference which relates also very directly to our experience. Our experience might shed some light on a specific problem which has been mentioned by your Government in the well-known report of the Secretary-General of the United Nations on the role of transfer of technology to under-developed countries. In this report your Government has stated in its official declaration that as a matter of fact 90 per cent of the patent applications which were filed in this country are filed by foreigners and that only 10 per cent are filed by Indian nationals. This fact is deplored by your Government.

As you might have seen in our memorandum, we touched a little bit on this issue. In this memorandum we tried to tell you that in our opinion this certainly is a situation that should be improved. We are of the opinion that as time goes on and there is more industrial development in India, no doubt, this ratio would change to the better, that is to say, there would be more Indian applications.

In this connection I wish to relate to you our experience. We have prepared for you a diagram on the basis of statistics of patent applications in Germany between the years 1905 and 1965. In this the patent applications are shown only in the form of a diagram but if you so wish I can give the exact figures for the last 10 or 12 years which I have with me. This diagram shows the total figures and then in two other lines, which are on this diagram, the applications are split up into "by German nationals" and "by foreigners". You will see that from 1905 onwards, at a time when Germany was already an important industrial nation in the world, the number of foreign applications was relatively high. This is shown through the line that you see at the very bottom.

I may draw your attention to the right side of the diagram, which deals with the period after the Second World War. As you can see, the broken line starts practically in 1949 —the time, as you know, when the Patent Office began to work again, and there you will see that this period of German reconstruction after the war from 1950 on, is characterised by very sharp rise in percentage of foreign applications. I can give you the exact ratio of last year in this respect—and I quote here from the official statistics of the German Patent Office—in 1965, the percentage of patent applications filed by foreigners in Germany was 42:61 per cent. I may state only briefly—I do not want to burden you with all these figures; if the Committee so desire, we are

ready at any time to supply this material—at any rate, I may point out that, for example, in 1950 this was 16 per cent and there was a steady rise every year and this is not surprising to us. We tend to believe that in a highly industrialised country, the high percentage of foreign applications is precisely an indication that this area enjoys a great economic interest, that it is to be considered an area where there is progress, where there is evolution and where there are chances for a better future. In this connection, may I relate to you from my experience, may be now, based on exact statistics, that since the starting of a Common Market authority and the attempts to coordinate and to merge the economies of he six sountries of Central Europe, the number of patent applications from abroad —and I mean from outside Europe including U.S.A.—in al' these countries, especially in Germany which is the only examining country for patent applications in the Common Market area has increased enormously. As a result of this increase, the German legislator is now faced with the problem to simplify the procedure, because the German Patent Office is no 'onger able to bear the load of examining every single application that is .made. Now this sort of fact in the Common Market area today where the number of foreign—and in this case primarily the United States—patent applications has increased so enormously and our Patent Office has practically broken down is again an indication that the economic progress in this area attracts the outsiders to come in and to operate in this market. I realise that for a country which has not yet reached this industrial stage, things might be judged little differently, but believe me, in reality in my opinion, there is also for India an indication that this great country with a large population is considered by any one who is well versed in the evolution of economics and technology as having a future. There is a future here and it is the intense economic interest of the area which is responsible for this more than anything else. From my personal experience it seems to me that for an industrial country like Germany a percentage of almost 43 per cent of foreign applications in the last year is quite indicative and quite remarkable, and as you all know, may be other witnesses from other countries have told you already—this is not an exception at all. Netherlands for example, has almost 80 per cent foreign applications. There are great many countries in the world where you find a similar situation. It seems to me, this is one of the cases where a certain amount of patience is needed. The problem should not be seen exclusively from a pessimistic angle. There is much good in this.

Now, Mr. Chairman and Hon'ble Members of the Committee, may I again give you some material, which in this respect, is of interest. I have here from the official statistics of our Federal Reserve Bank figures which were published in the years 1964 and just recently in 1966, which show balances of royalties paid and received in the Federal Republic of Germany for inventions, processes, copyrights and so on and so forth. Now as you will have a look at this document —I would ask you to have a look at it—you will see that Germany today in the year 1965, arrives at a completely negative balance of royalty payments. As a matter of fact, if you look at last column you will very well see from 1950 on, when the negative balance was still very small—but this, of course, was due to other factors *i.e.* the receipts and expenditure were very small, because this was the very beginning of our industrial progress—it was very small in 1950. It has come upto 462. In order to explain to you this table in a correct and complete manner, I would attract your attention to the following. That upto 1962, in these statistics of our Federal Reserve Bank, also the payments for copyrights and similar rights were included. There seems to be, in fact there is no use when discussing technolo-

gical changes to include payments for things of that sort. I will ask you to consider the figures in 1963 and there you see in the second column, the payments for copyrights and similar rights are listed. So if you take the figures of 1965, you would have to subtract 19 and would arrive at the figure of 300, which would mean that Germany has received in 1965 a sum of 300 million DMs for royalites. And if you look at the expenditure side, you would have to subtract 121, which leads you to 660. Germany, in other words, in 1965, expended 660 million DMs for payments on royalties. The negative balance, if it is corrected taking into account copyrights etc. would be minus 360. Well we can draw this simple lesson from this, in 1965, Germany which in ranking is far above placed amongst the industrial nations of the world in industrial output, paid more than double in royalty payments to other countries than it received. In spite of all the expenditure we have and all the efforts we make for research, because we are convinced-this is our personal experience—that you can neither build up an industry nor maintain an industry unless you devote a great deal of money and time on ingenuity, research and development—in spite of all this, we cannot run our economy and our industry without the help of countries that have more experience *i.e.* are more advanced, and if you draw the balance of payments, you will realise there is clear indication that we in Germany are more at the receiving end than at the giving end. This again, I think is a very interesting fact. I am glad that we are in a position to give you the latest figures of 1964 and 1965 which have just been published three or four weeks back.

I may say one thing more. Just as we do not consider the number of foreign applications to be a liability, we are equally not likely to regard this in Germany as a completely negative thing. It seems to us that you have to arrive at a sort of balance in any economy and in the exchange of technology and science. Even where you do all the things that you can do yourself with the utmost efficiency, you have also to invite foreign cooperation. We, in Germany, would always be willing to depend in the chemical industry on the ingenuity and experience of Americans, of Swiss and of others and we would be only too glad to learn a great deal also from you. In chemistry, we would be at the receiving end in the sense that we would have a black-flow of your personal experience of some of the methods that we try to use here in India.

We wanted to show you the experience of Germany after the Second World War. Of course, it is an experience which you cannot just take and apply to any other situation in the world. I am completely aware of this. But there are certain parallels in the world. In spite of total destruction we had quite a few men who knew how to run industrial installations. I can assure you that if we had not taken these measures to protect these intangible assets, let me say like a small little flower that is just about to come out, it would not have grown into anything and the material aid which we had received later on under the Marshal Plan would not have been put into good effect. If we had not created this system which protected our own creative thought and—it is equall important—which encouraged the other countries and also our former enemy countries to come back and say, "Well, let us try again; let us arrive at technological cooperation" the Americans, the British, the French and all other countries would not have moved an inch. If they had not had the assurance that their know-how and their inventions have a very good and solid protection, they would not have come forward to cooperate.

We are dependent on cooperation. Today, in science and technology, there is the science which is worldwide. The science or the British science but it is the science which is worldwide. The knowledge must be communicated which is, after all, one of the ends of

the patent system. But the disclosure of the knowledge alone is not sufficient. Contracts must be made, experience must be communicated to others. This can only be achieved by a sound patent system.

Now, let me say a few words in regard to the Bill itself which, of course has been touched upon to some extent in the Memorandum which has been submitted to you in January. It is quite clear, as the representatives of the Association of the Chemical Industry in Germany, we are particularly interested in certain clauses of the proposed legislation which deals specifically with chemical inventions. However, one cannot look at all these things in such an isolated manner. We have to go into the provisions as such in their complexity and in their entirety. I have not the intention to repeat what I have already said. I would just briefly mention a few things which may have not come out clearly in our written Memorandum. Let me touch upon, very briefly, the provisions of compulsory licensing, working of patents and licences of right and revocation. That is all contained in pp. 4, 5 and 6 of our Memorandum. But let me make a few general remarks here. We have our experience in Germany. Of course, the system of compulsory licensing is self-evident in a way and the experience has shown that the temporary monopoly which is conferred by the patent—the legislator confers this monopoly for very good reasons—should be under some sort of control. Whenever there is an abuse or whenever there are overriding necessities, may be in public interest or for public welfare, legal measures must be taken in advance to guarantee that the invention which is patented will not be abused. This may be resorted to only in the case of abuse of the right conferred by the patent.

I may, however point out that there are other correctives in an economy which are, in our experience, more effective. One of them is competition, specia'ly when you touched upon the problem of prices which we shall discuss here sometime ater. There is only the competitive element which works in an-automatic and efficient manner. Of course, we also have it and practically in all industrialised nations, there is some sort of legislation which deals with restrictive trade practices. It is quite clear that in this field of legislation of restrictive trade practices, you must also touch upon the issue of patents and industrial property rights. In Germany, we enacted the Restrictive Trade Practices Act in the year 1958. Without going into the details, the basic principle of the law is that any measure, any contract, which restricts competition or which falsifies the competitive normal market situation is, as such, not valid. Then, of course there are certain exceptions which have to be there. The authority which has been created for this purpose can make exceptions and grant permissions for certain agreements. This German law, in dealing with patent rights, industrial property rights, in Sections 20 and 21 says very clearly that all the licensing agreements as such are valid as long as they do not impose upon the icensee any obligations which go beyond the scope of the right conferred. Now, let me give you one very simple examp'e. If I am a patentee. I can give my patent t oDr. Heubaum and allow him to run it until the year, let us say, the dates of expiration 1971. Under this licence contract, if I would obligate him to be bound to this agreement beyond the year 1971, this agreement would not be valid because it would go beyond the scope of my right. This is, of course, only a very simple exaample. Any licensing agreement which goes beyond the scope of the patent right is invalid. Now you see here again that the Germa1 legislation in a field that has nothing to do with compulsory licensing, which is of greatest importance in the Restrictive Trade Practices Act, has expressly permitted these agreements which after all are based on a monopoly

right. The legislation has clearly said that as long as these licensing agreements are within the scope of the right conferred to the patentee, they are all right. They need not be exempted; they need not be registered. They are all right. But I may tell you that there are certain restrictions of licensing agreements, restrictions which I would impose upon Dr Heubaum, referring to my example, that he would produce only in such and such a manner, manufacture the product in that and that quantity or only in that territory or only within a certain time. The restrictions of this sort by legal definition are within the scope of the patentee's rights. So you see that even in Germany where we have a 'ather strong law on restrictive trade practices, it had been found to be necessary and especially here the licensing agreements should be so to say exempt ments should be so to say exempt. There are a few examples outside of this sphere but they are not regarded as restrictive by legal definition. Furthermore, I may point out that the legislation has also provided for a number of cases where certain clauses in such licensing agreements may have to be registered with an authority who will issue the permission that they be practised. For example I am a patentee and I can give the licence to Dr. Heubaum. But I will not be allowed to oblige him that he should buy the raw materials and other intermediate products from me. But if I can prove, and if it is the case, that the flawless technical execution of this material which is protected, depends on this raw material which is under my control—in other words where there are technological reasons for it—then this sort of agreement is all right, and the law does not scorn it. The legislation in Germany has been made with a great deal of care in these matters and the significant factors may be of great interest to you. I am giving you our own experience in Germany where the legislator in the Patent Act itself has reinstituted the traditional system of strong patent protection, where for developments after the war it was thought necessary to have a very strong restrictive trade practices Act, where the legislator found it necessary to protect especially the industrial property rights by special clauses, because it is very well known that unless you do that—give a rather strong temporary monopoly—you will have no technological advance.

I don't want to comment at the moment on the individual clauses of your compulsory licensing system. I may point out that in Germany also we have a clause which deals with compulsory licensing and this compulsory licence is to be granted only where public interest requires it. In 1965, we did not have one single case for arbitration and I must tell you that applications for compulsory licence for reasons of public interest are very rare indeed, the reasons for this being that the law puts up a very high barrier of conditions which have to be fulfilled. In theory you find this almost in any patent legislation in the world, for example in your Bill also. Due consideration must be given however to the fact that the applicant for a compulsory licence will really be able to produce on a commercial scale the patented product. But of course, the jurisprudence of a certain country on this matter is of high importance in our view. It is mainly the jurisprudence which decides doubtful cases and which will put the accent on how a certain clause should be interpreted. Our experience in Germany with a very restrictive sort of compulsory licensing system, is that it is very difficult to get a compulsory licence. There is only one ground, public interest and no other. I know you are concerned with the problem of non-working of patents. I will come to that a little later. Our general experience would show that compulsory licensing is a fleet in being which should be there and must be there but there is no use having an arsenal of all imaginable weapons which should be wielded by

the Government authorities, which could be used by competitors, which could be used by practically anyone and which go very far in detail. In other words, a very detailed and elaborate system of compulsory licence will have a detrimental effect.

May I, Mr. Chairman and Hon'ble Members of the Committee, draw your attention to one particular point which is very much on my mind and, I will say, rightly so, because it touches in particular the entire chemical industry? This is the regulation called the "licence of right" which is found in your proposed legislation—sections 86 to 89. May I, Mr. Chairman, make a few remarks first as to the terminology, because there seems to be some sort of a confusion regarding the terminology. You are quite familiar with the Model Law of the United International Bureau for the Protection of International Property, which also deals with something which is called "licence of right". However, the licence of right which is proposed is of a completely different nature. There a provision is made which depends on the voluntary action of the patentee. A patentee can, if he so chooses, make a sort of a declaration, which will be registered duly by the authorities, to say that any one who wants to use the patent can use it on terms agreed upon. In Germany, we have a similar regulation in our law. It is, I believe, in Section 14, which we call somewhat differently. If I translate it in English, it means 'willingness to grant licences". The Legislature, when it framed this clause, had the following reasons in mind: a small inventor, an individual scientist, may sometimes find the patent fees involved to be rather high; so it was felt that granting a reduction in the annual fees if he grants licences freely to the public, will be very helpful. Another reason is that smaller companies which do not operate so extensively in the market might have difficulties sometimes in finding adequate partners for licensing agreements; in most cases, if the size of the company is small, you will need certain agreements with others to help you in production, distribution and so on, therefore, it was felt that a smaller company might find it helpful to have a sort of public notice that any one could come and ask for the licence. This is the concept of licence of right as far as we have understood it. If you so wish, I could also give an indication as to how many of such applications and notifications have been made in Germany in the last year. There were several thousands of notifications of this sort last year in Germany.

The system which is being proposed in your Bill is something complicated and if you permit me, I would not call it "licence of right"; I would call it "automatic licensing" because I speak here for the chemical industry. According to Section 89, any invention in the field of chemical industry will automatically be endorsed with licence of right and this in turn means that any one can immediately apply that a licence be given to him.

Shri Bade: Read Clause 90 also; that is also applicable.

Mr. Albrechtskirchinger: Clause 90 deals with "when reasonable requirements of the public deemed not satisfied".

Mr. Chairman: You referred to Clause 89; Clause 89 says:

> "Where, in respect of a patent, a compulsory licence has been granted on the endorsement "Licences of right" has been made or is deemed to have been made, the Central Government or any person interested may, after the expiration of two years . . .".

Mr. G. Albrechtskirchinger: I am sorry I misquoted the Clause. Clause 89 deals with revocation of patents

after the grant of compulsory licence or the endorsement "licences of right". The Clause that I was thinking of is 87, which deals with certain patents to be deemed to be endorsed with the words "licences of right". That is what I should like to call "automatic licensing". There, of course, you have quite a few sectors of industries, for example, alloys, optical glass, etc., which are individual productions of certain industries. But in the field of chemical industry, no distinction is made. It is applied for the whole industry; the "licence of right" would always apply to it and Clause 88 regulates in detail as to how this will be done. Mr. Chairman and hon. members of this Committee, if this Clause is passed, the chemical industry will be completely under a different regime.

Mr. Chairman: Not to all chemicals; it is only in respect of substances used or capable of being used as food or as medicine or drug . . .

Mr. G. Albrechtskirchinger: May I give my interpretation of it? I refer to the Clause which I should like to call "automatic licensing". I would like to ask you to tell us whether it is correct or not. The clause which deals with "automatic licensing" has nothing to do with discrimination or a special measure with regard to the drug industry. It deals specifically with all inventions in the chemical industry totally. There is one additional measure which hits the pharmaceutical industry. In respect of a patent endorsed with "licence of right", royalty has to be paid; this royalty should normally be agreed upon between the patentee and the licencee and in case there is no agreement the President of the Patent Office, if I am correct, will have the right to arbitrate in the matter—to settle the terms. There, for the pharmaceutical industry, you have introduced in the proposed legislation a royalty ceiling of 4 per cent. This is the only difference. But we want to make it clear to you that this particular Clause, Clause 87, puts the entire chemical industry in your country—all inventions in this field—under a completely different and special regime. What we want to discuss with you in detail is whether this is a wise measure.

Shri Bade: How are the chemical indusries included?

Mr. G. Albrechtskirchinger: May I explain it to you? If I may say, your Sec. 87 reads:

"Notwithstanding anything contained in this Act,—

(a) every patent in force at the commencement of this Act in respect of inventions relating to—"

May I skip the first paragraph as also the second one and read (iii):

"(iii) the methods or processes for the manufacture or production of chemical substances including alloys, etc."

shall be deemed to be endorsed with the words "Licences of right", in the case of inventions referred to in clause (a), from the commencement of this Act . . .".

In my opinion, it is quite clear and in Europe it is always interpreted in this way,—if I may say, I would be surprised if there were a difference of opinion—that the entire chemical industry will be automatically brought in. This is a legal obligation that you devise here. There is no administrative act needed. It will be automatically subjected to a special regime of licensing—as I call it, automatic licensing. Am I correct?

Shri K. V. Venkatachalam: That is correct.

Shri R. P. Sinha: It is only in respect of patents in existence at the commencement of this Act.

Mr. G. Albrechtskirchinger: No. It is for both. It is a technical question of phrasing in such a way that it applies to both sorts of patents, but both are specifically mentioned. I think I am quite correct in this interpretation: from the moment that you would pass the Bill in the way it is proposed now, any invention—I want to stress this again—any invention in the chemical field, no matter whether it is for drugs or dyes, would be treated completely different. What I would like to discuss with you is: whether this is a right thing to do? We do not believe so. I was surprised to find in the notes which accompany this draft law a very short explanation as to why this clause is included, that it is included in order to guarantee or to make sure that there will be a proper development of the food, drug and chemical industries in India. This is to say the moliration which has become apparent by the very publication of this draft law. I think you need plenty of time to discuss the meaning of this 'Licences of right'—this automatic licensing and what it would amount to. In our memorandum we have said a few words about it. You find there a short summary. We do regard it as a discrimination. When I say 'discrimination', it is not in any evil sense of the word. What I want to stress is that it is a different sort of treatment. We do not believe there is any basis for a different sort of treatment. As a matter of fact, we believe that the development of the chemical industry which is one of the basic and most important industries for the industrial development of a country would be sincerely endangered and probably made almost impossible if this sort of special regime of automatic licensing is imposed. The reasons for this, it seems to us, are self-evident. If you want to have an industry, if you want an industry to prosper, to make progress, in our experience, what you should do is to provide a strong patent protection for it. In our Patent laws usually, with very few exceptions, we have no differential treatment. I will come to the question of processes and products protection in the chemical field which is a very special issue and has historical roots. It has to be explained in a calm manner. If you want any industry to prosper, you must provide for good and certainly equal treatment as compared to other industries. If you do not do this, the results would be: first of all, you would hamper the development of your own chemical industry. All the efforts now made to build up indigenous research, to build indigenous production units would be hampered by this sort of treatment. It would frustrate these efforts to a considerable extent.

Secondly, you would also restrict the inflow of the foreign element of technology, parting with inventions, probably also the setting up of chemical installations and production units in this country by foreign entrepreneurs. Also from my own experience, there is no use, in our opinion, for any country, less or more developed, to be sort of hesitant about foreign elements in their industry. One should not do this. One should regard this as a chance of further co-operation and further evolution and it seems to me that in India at the present stage, development depends to a large degree on foreign industrial companies' experience which after all, when they come here, incorporate themselves according to Indian laws and become Indian companies but they bring with them a lot of substantial knowledge and experience which will promote here industrialisation in a well-balanced manner and India will later on, in my opinion, quite clearly present a completely different picture and even when India attains considerable industrial development, she will always need and probably will welcome more and more collaboration with foreign industry. Germany has long since overcome this sort of apprehension that you might sometimes have and I am pleased to say that our

field of operation is no longer Germany but the European Common Market and many countries like France, Italy, etc. are no longer a foreign land for us. The Common Market has become an economic reality. In other words, automatic licensing, in our opinion, will have a disastrous effect on the building up of your indigenous chemical industry and on the very chance of making use of the foreign element for which there is a pressing necessity in India now.

I have taken a considerable time and I feel that I should restrict myself very much in elaborating further on the specific clauses of the Bill. If you so desire, may be later on during the question period, if any member desires to discuss any specific point, I will gladly do so.

I will only touch upon 3 or 4 general points. Let us take the term of patents. It should be pointed out and we have pointed out this to you several times, I believe, that the international trend is towards a period approaching 20 years and not for a period approaching half of it as it is proposed in your Bill. We have this trend in Europe. It is so in the draft European patent Law of the Common Market which has been discussed and not yet been realised. It will be of special importance to India. That the 29 years terms is also in the BIRPI draft model law. It is after all a law drafted for the countries in the process of development by representatives of industry of developed and underdeveloped countries to share their experience, and they also propose a term of 20 years. If you change it to 14, one might argue whether it is a decisive step or not, but to reduce it to 10 years for pharmaceuticals is especially bad, because it is quite well known that the period between the birth hour of an invention and the marketing of the product, for a number of reasons, is especially long in this industry. There are a number of steps which are identical in every chemical invention, but in addition, in the case of pharmaceuticals, toxological, clinical tests etc., have to be undertaken and this takes a long time. So, by reducing the term of patent for the pharmaceutical product further, in reality you reduce it by more than the number of years that are put down in the law.

The question of process protection and product protection has been discussed very often, but we should be very clear about the terminology. In Germany, for historical reasons, our patent law has always been process protection in chemistry. This is the English translation of section 6 of our law:

> "If a patent has been granted in respect of a process, its effect shall extend to the products directly obtained by that process."

This, of course, is in reality not process protection, because this process protection extends automatically by legal definition always to the product which is the direct result of this process. There is a further safeguard along these lines in our section 47, para 3, which has also been in effect for two or three generations now, which reads:

> "If the invention made use of relates to a process for the manufacture of any substance, then, until proof to the contrary has been established, every substance of the same nature shall be deemed to have been produced by the patented process."

In other words, if I have a chemical patent in Germany, which will be a process patent, and I find out that the product which is produced under this process by me is also produced by somebody else, an infringer, who does not have the right and I

sue him, it will be the infringer who has to prove that he produced this by another process, and unless he is able to prove this, he will lose the case. In other words we arrive at what is commonly called product by process protection. It is not process protection as such.

In the United States, for example, there has always been product protection for chemicals, as also in France since 1844 or so but in Germany process protection since our law was passed in 1876. This is due mainly to historical reasons, due to certain ideas that this would be better for the development of this industry, but if you draw any conclusion that because of process protection Germany has prospered more than, say, France, it would be very difficult to establish, because the factors which influenced its development are of a completely different nature.

I would like to express very strongly that if you do not include the sort of clauses which we now have in Germany, where the product produced immediately by the process is also protected and where the infringer will have to prove that he did not use the process in order to arrive at the product, you weaken the protection in such a substantial manner that the final result will be negative.

Shri K. V. Venkatachalam: Please look at Clause 47(1)(b) of the Bill where the protection extends to the product made by the patented process.

Mr. G. Albrechtskirchinger: I am not quite sure it does.

Shri K. V. Venkatachalam: Anyway, that is the intention. If I may say so, I would not like to go into it very closely now and we cannot at present give an opinion on it, because we have to study it very carefully. I would like to look upon this in a more detailed manner and then let you know.

Mr. Chairman: Clause 47(1)(b) says as follows:

> "Subject to the other provisions contained in this Act, a patent granted, whether before or after the commencement of this Act, shall confer upon the patentee—
>
> (b) where a patent is for a process of manufacturing an article or substance, the exclusive right by himself, his agents or licensees to use or exercise the process in India and of using or selling in India articles or substances made by such process and of authorising others so to do."

It is quite clear.

Mr. G. Albrechtskirchinger: May be, but, if I may say so, this would not be the moment to give a final opinion on it because it has to be carefully investigated.

Mr. Chairman: There is no ambiguity about it.

Shri K. V. Venkatachalam: Anyway, that is the intention.

Mr. G. Albrechtskirchinger: That is the intention, but it should be carefully studied to arrive at a wording which will be foolproof.

Shri K. V. Venkatachalam: Otherwise, a process patent has no meaning.

Mr. G. Albrechtskirchinger: I fully agree. I personally believe that it may be wiser at the moment to have a product protection for chemicals because science itself has changed.

On this, one can of course have different ideas.

Now, I would like to come to one of the most important points in my evidence, because we believe that the picture given so far would not be completed if we stop here. We have very much heard of the problem of prices, and in particular the prices of certain commodities in the chemical field; in order to deal with the problem in an adequate manner, our experience in Germany shows—and that is also our experience in India, since, after all, the German industry is here and it has started work in quite an effective manner—that the factors of general chemical economics must be considered in order to appreciate the problem of the cost of production and of prices. My friend Dr. Heubaum has prepared a brief study on this issue which we hope will help to illustrate the point. With your permission, Mr. Chairman, I may request Dr. Heubaum to present this material to you and the Committee.

Dr. Ulrich Heubaum: In previous discussions on the proposed patent legislation in India, the subject of prices of chemicals in India and elsewhere has been repeatedly raised. We feel that it would be helpful to offer some material which is based on the experience of the German chemical industry engaged in the production of identical chemicals in Germany and in India. We have prepared a cost analysis which we think is representative for quite a number of chemical products in both countries and which may be seen in the diagram which is being distributed at the moment. This diagram deals with firstly agricultural insecticides and secondly with a group of general organic chemicals and lastly with a pharmaceutical compound. The products selected for this comparison are not patented which shows that the predominant reasons for cost differences of any of the chemicals produced in the two countries lie outside the patent field. The results of such a cost analysis are shown in the diagram which we would like to submit to the Committee. In doing this, we beg you to understand that the actual production cost cannot be disclosed openly in a competitive market. For this reason, the cost situation is given in the form of a diagram wherein the German production cost figures are given as 100 per cent and the Indian production costs percentage-wise accordingly. The data and ratios given in the diagram are based on figures which serve to calculate the cost of identical productions in the different countries. May I ask you to look at the first example which is an insecticide? The production cost of this compound in Germany is shown by the column on the left-hand side. The comparative cost of the same product in India is shown by the two columns to the right which are based on the official exchange rates of the two currencies involved, before and after the devaluation of the rupee. You will note that before the devaluation of the rupee, the production cost of this insecticide in India was roughly 210 per cent of the German production cost. The devaluation would bring that down to approximately 135 per cent provided that no further cost-rising factors come into the picture such as rising prices for imported intermediates or manufacturing costs in India.

The second example deals with compounds needed in the rubber industry. The first column shows the production cost in Germany expressed as 100 per cent. The respective production costs in India amount to about 240 and 150 per cent respectively. In drawing a preliminary conclusion from these first two examples, where patent protection and therefore expenses for royalties do not come into the picture at all, it is not possible at present to produce in India at comparative costs. The reasons for this are manifold, one of them being higher cost for indigenous raw materials, not to mention the fact that production in smaller units is always more costly. The

effect of lowering cost by increasing the units may be seen in our third example which describes production cost ratios of a pharmaceutical compound where patents also have no bearing. Production costs in India are drawn in twin columns where by the columns designated with (b) represents a unit of a 50 per cent production increase, compared with (a). You will note that this production increase lowers substantially the production costs. In spite of this, it can be seen that the production in India is still at 400 or 250 per cent respectively before and after devaluation of the rupee. It may be noted also that customs and clearing charges for imported intermediates contribute considerably to the higher costs. Incidentally, these samples are representative for the complexity of organic synthesis in general with its multitude of production steps. It is characteristic for a great number of chemical processes, as for example, dye-stuffs.

May I refer in this connection to another diagram in which we will try to describe graphically the main steps involved in the production of a well-known pharmaceutical by the name of chloroquine which is used in the treatment of malaria and rheumatic diseases. The starting material for the synthesis of this pharmaceutical is Ethylene which can be found in the middle of the top of the diagram. From this raw material, two different series of production steps must be gone through which you will find in the left-hand and right-hand columns in order to arrive at the final synthesis after a total of 16 production steps. To render this picture complete, however, the introduction of other chemicals represented by arrows in our diagram into the production process must be considered. These chemicals in turn are the result of separate reactions which again require a number of production steps. To make the diagram simpler, the production steps are indicated by the number of arrows. The total of production steps involved is about twice the number mentioned before; that means, about 30. Furthermore, the by-products which result necessarily in the course of the synthesis are not indicated. Incidentally, most of the intermediates are not shown by their chemical names in the diagram for reasons of simplicity. If you wish, the names of these various compounds can be given.

In Germany, the complete synthesis of such complex compounds starting from Ethylene presents no problem at all for any chemical company, because either all the chemicals needed are produced by the company itself or are readily available in the domestic market. The manufacturer may choose whether he supplies or buys the various chemicals needed in the production. Let us now turn to the possibility of synthesising the compound in India. It would, of course, present no difficulty at all to an experienced chemist to perform this synthesis on a laboratory scale. To produce, however, this compound on a commercial scale, which means also at reasonable cost, sufficient quantities of all intermediates must be available. Experience shows in this and some similar cases that all the chemicals needed are not available here at a reasonable price. In order to produce such a commodity commercially in India, the manufacturer under the present conditions is compelled to restrict his synthesis to the last steps. In spite of this, as our previous diagram has shown, the production cost of chloroquine in India, which is actually the pharmaceutical we have been talking about, is many times higher than the corresponding cost in Germany. Should the manufacturer in India now attempt to make the total or a substantial part of this synthesis in India, the production costs would be even more unbearable. As has been mentioned before, the chemical industry in India seems to be handicapped at present by lack of sufficient raw materials and chemical intermediates at competitive prices.

To illustrate this may I mention some examples? Ammonia, the basic chemical for nitrogenous fertilisers and an important precursor for many chemicals is still about 6 times as expensive in India as in Germany. Likewise, nitric acid, the derivative of ammonia, is about 5½ times more costly in India. Caustic soda, an important product of brine electrolysis costs 2½ times in India as compared to Germany. Similar relations are true for intermediates such as carbon-disulphide, an important reactant in the rayon and rubber industry, the price of which is 5½ times more than the world market level. Most of the compounds irreplaceable in the manufacture of chemicals and auxiliaries are 2½ to 3 times higher here in India. Some of the reasons for this have been mentioned before—smaller units and also relatively high investment costs. As far as this latter item is concerned, I should like to refer to the last part of the diagram which has been submitted and which shows the increase of investment costs of chemical production in India. The column on the left-hand side shows the actual expenses in India of a complex chemical manufacturing unit divided into imported machinery, machinery from India and customs and clearing charges. Within the one year period between 1964 and 1965 the total investment cost for a certain plant which is being constructed at present has risen by almost 50 per cent as the last column on the right-hand side will illustrate. You will note from the middle column that the factors which are responsible for this increase are almost exclusively indigenous factors, that is to say machinery produced in India, expenditure for building and increase in custom and clearing charges for imported machinery. At this time, it should also be mentioned that the cost of chemical equipment is on an average three times as high in India as in Germany. The items mentioned in the diagram can be supplemented by numerous exampies. The production costs of certain dye-stuff compositions used for printing textiles now being produced in India as well as in Germany are 2 to 4 times higher. The same is true for intermediates used in making these dyestuffs. The world market in chemicals has for years shown a consistent tendency of declining prices due to strong competition. This tendency necessitates more and more rationalised production and to produce in ever larger units. In developing the chemical industry in India, this long-term trend must be taken into consideration and I am sure your government is well aware of these factors. India has, for instance, decided to get outside help for the construction of huge and modern amonia plants which can operate at a low cost and provide this important chemical at world market prices. We feel the considerable price difference in chemical commodities between India and the world market will become less and less the more basic an intermediate chemicals are being produced in India in modern and sufficiently large quantities and in a well-balanced structure. Then the question of backward integration will become a logical necessity and the manfacturer in India will have an incentive to supply his production from indigenous intermediates instead of imported chemicals. Finally, he will arrive at a more or less complete synthesis of complicated compounds at lower expense.

Mr. Chairman, hon. Members of the Committee, I have confined myself, in my presentation, to technological and economical aspects in chemical production. The material presented to you highlights the cost structure of certain representative productions in India and in Germany which are being carried out. It has also shown to you, in this connection, the complexity involved in chemical reactions. These factors are of an economic nature and are economic realities which lie outside any patent legislation.

One of the strongest motivations of the Bill under discussion was the price

level of certain chemical commodities. I hope to have shown some basic factors which are almost exclusively responsible for the price level of a chemical commodity. These factors can be influenced only by measures in the economical and technical field. Accordingly, any remedy lies in influencing or changing these factors, but no patent legislation will have any influence on this. As a matter of fact, we feel that the proposed legislation will not only be no remedy watsoever for the price problem but will rather endanger the future development of indigenous chemical industry by frustrating Indian research and development as well as the inflow of technology. Therefore, we would like to conclude our evidence by saying a few words on the attention paid to research by the German chemical industry.

Mr. Albrechtskirchinger: Mr. Chairman, hon. Members of the Committee, as Dr. Heubaum has pointed out on his concluding remarks—and, in my personal opinion, this material has been very carefully prepared by us based on actual figures of production costs of identical products which are made in Germany and India,—it is convincing to show where the cost factors are. We have shown with some purpose—it may be also accidental—certain productions where patent production does not really come into the picture. If you look at these statistics, which are true indications of what the situation really is like, and if you would imagine that any royalty may be added, you might hardly see it on the diagram because it would be a very very small item. In other words, as Dr. Heubaum has pointed out in his concluding remarks, in our sincere opinion and our own experience, any attempt to influence the price question of chemical products or any other commodity by making changes in the patent law, especially by making it in such a way to show differential treatment as to certain sectors of the industry, will have no result whatsoever along these lines. On the contrary, it will lead to other results on a different level, which we would consider very grave.

May I briefly say, when you are having no research you will have no progress. In your country as well as ours, the future depends on one's own efforts. Our personal experience has shown that the patent system is necessary for a number of reasons, to provide a climate for research and development. There is, of course, the question, as is always said, of the temporary monopoly on the product because the patentee has to risk the additional investment that has been made. I think it is very much more because, as pointed out in parts of our evidence, this patent protection is such a security that it confers and encourages technological cooperation with the rest of the world, which, after all, is of the highest importance. Further more, it is a very powerful incentive to work on a scientific level, on a laboratory level and, not only work, but to readily disclose whatever we have.

May I, Mr. Chairman, refer you to the last diagram which we have prepared, and may I point out to you the result of an enquiry which has been made by our association on the expenditure of the chemical industry for research and development during 1964-65? This table includes some other items which might be of interest to you. Item (2) gives the total number of employees in the chemical industry. If you look at the next number you will see the percentage of persons among these employees who are engaged in research and development with university training. There are of course, a great number of people engaged in research and development who have no university training and who do equally very very useful work in the laboratories especially when it is not a question of basic research but applied research to problems of production on a commercial scale where a great amount of additional research has to be done. But you have here the

number, which is very indicative, of people with university training who are engaged in chemical industry and work in research and development.

Mr. Albrechtskirchinger: Further-expenditure and we have also a statement of donation. Now these donations are also of some sort of importance, because the chemical industry in Germany tries to help social institutions, many scientific institutions to carry on the work or to do better work. There are also grants which are given for scientific purposes. May I, Mr. Chairman, conclude by giving you some information on a special institution that has been created within our Association in these past 15 years? It will throw some light on this matter. We look into the laboratory work being done today. We look into the future whether we will have enough chemists and scientists in 10 years or 20 years. So we go to schools. We give them books. We supply teaching material. We give scholarships to promising chemistry students. If I may tell you, Mr. Chairman, it is financed in the following way. In order to ensure that this will be handled in a fair and impartial manner, a fund has been created and every member of our Association, that is, the chemical industry of Germany, is now under an obligation to pay into this fund. At the rate of DM 1,25 per employee per month. It is based on this idea: the more employees there are, the more must be paid into this Fund. And then, of course, there is an administration which looks over the working of this Fund. In the year 1965, this fund has distributed 8 million Marks. This is a unique feature in Germany. We are the only industry where this functions on a completely voluntary basis. It has done enough research all over the world but it looks ahead to the future. A number of measures have been taken by giving money to University laboratories. We finance scientific publications which would never be bought for the price they would have in the market. We have subsidised this price. We send people to other countries to study. So, all this is being done for the training of people. This is more or less a sidelight; it is not really the story of research and development in Germany. I have given you the figures. I had wanted to tell you about the idea of this special fund, the importance that we pay to this problem and we would ask you to consider specially this. The chemical industry is one of the basic and the most progressive industries in the world. This industry depends on effective research. I may give you one little figure. If you look at one of the largest companies of chemical production in Germany that produces everything—from the drug to the synthetic fibre—, you will find that 50% of the products they sell today were not in the market ten years ago. This is the basic figure, which is applicable. In other words, it is a fast developing and dynamic industry. The measures which you propose to adopt will, in our opinion, lead to opposite results. I think you will do no good to your country. So please accept this as our opinion. We have not come here for selfish purposes. In your country, as you know, we have participations. We operate everywhere in the world. The operations in your country are not easy for us. On the contrary, it is sometimes very difficult under the given conditions. I do not want to overplay this. I also wish you to realise that the German chemical industry at the moment suffers from a lack of manpower and we do not really know how to cope with this problem. We want to do this and that. But we have not come here as representatives under selfish motives. I hope you will take the impression that we wanted to share our experience with you. In our sincere opinion by passing this Bill you may discourage also foreign companies. However, for the development of an organized chemical industry it is a necessity for your country to become sort of development, the present Bill would be no basis.

Thank you very much, Mr. Chairman, and Members of the Committee.

Shri K. V. Venkatachalam: In the last statement that you gave, the turnover has been shown as so many milliards. What exactly does this mean?

Mr. Alberechtskirchinger: The term 'milliards DM' is used as defined, in the Oxford Dictionary. It would be 100 crores. The first item is in milliards Marks; the others are in million DMs. I am sorry it is not quite clear.

Shri K. V. Venkatachalam: I was comparing the figure given against turnover with the figure given against 'research' against item 4. What percentage does it work out to? 3 percent?

Mr. Albrechtskirchinger: No, it is more. Because we do not have any official statistics which could give a complete picture, our Association made a representative enquiry which is as complete as possible during the last two years and we have come to a figure which is somewhat more than 3 per cent. In reality, there is a great deal of variation. For example when I make an analysis of the annual reports of two of our largest chemical concerns which operate in every field of chemical production I find that their research expenditure is roughly 5 per cent of the turnover. Sometimes it is very difficult to arrive at the items of expenditure which constitute research and development. I have given the break up specifically in order to show that we do not at all want to exaggerate. Here I want to explain quite clearly that in certain spheres of chemical production the research expenditure is much higher than in other fields, and this is so in the case of the pharmaceutical industry in Germany, where it is double. In the case of a firm like Bayer if you take the break up of expenditure for different departments you will notice that the expenditure on research and development is quite high. In the pharmaceutical industry it is at least double, and sometimes three times the expenditure on research in other branches. In the chemical industry as a whole it may vary from 4 to 5 per cent.

Shri K. V. Venkatachalam: Could you give any figures about research expenditure by German firms in India?

Dr. Ulrich Heubaum: No. I am sorry, I do not have those figures.

Dr. C. B. Singh: An impression is growing that the difference in nomenclature between process and product is more artificial than real. You have mentioned that the process is so modified now that to bring about a difference between a product produced by a particular process and another process has become increasingly difficult. Will it be a correct conclusion?

Mr. G. Albrechtskirchinger: I think the question revolves round the issue whether we should have pure product protection or pure process protection. It seems to me that the intention is to avoid the sort of thing which we were faced with in Germany in the early days. What is the right thing to do? Modern chemical science is concerned with the discovery of new active substances rather than anything else. In the beginning the role of chemical science was quite different. Therefore, it was thought that new processes have to be thought of in order to arrive at new results, that one should make sure that by granting process protection discoveries of new processes should not be blocked. But now there is practically no new process. Chemical science has become so systematic and complete that, to the best of my knowledge, new processes do not occur. In Germany our jurisprudence has developed what we call protection by analogous process which contrary to the wording of the law—and this is the product of the think-

ing of judges—has given protection to the process, although the process is known to any chemist. In all the advanced countries if we have process protection, it is product by process protection. We should also go along those lines. There is another additional argument which is of importance. The patentee of a chemical patent in a country where we have process protection is obliged to cover all the imaginable processes that he could think of. In other words, it is not only duplication but multiplication of effort.

Dr. C. B. Singh: I wanted a simple answer to a straight sulphanilamide question. You know that sulphanilamide is a simple product. From that you can have 20 more products by molicular substitution. They are all given different names and in some countries they are patented as different products. The same thing can be said of many other products. By a simple process of substituting one molicule or the other and altering their position in the chain you are able to produce so many products. But the process remains essentially the same. A clever barrister like you can probably prove before a court that it is the same product manufactured by the same process. In view of that, is this distinction between process and product more aritificial than real? Is it a fact that chemistry has advanced so much that the distinction between product and process has become unreal? In our Bill we are protecting the process. Will you feel satisfied if we include in it the product also?

Mr. G. Albrechtskirchinger: From our experience of evolution of chemical industry in Germany we would recommend product protection for chemical inventions. Should you, however, think that process protection is the right thing you should have product by process protection.

Dr. C. B. Singh: You have mentioned that the prices of everything in India are higher. Does this increased cost include the know-how paid by Indians to (i) foreign experts; or (ii) the cost of raw products imported from foreign countries; or (iii) the cost of machinery and spare parts imported from abroad? Are any of them responsible for the prices in India going up?

Dr. Ulrich Heubaum: I may elaborate on this and give some supplementary remarks to the figures which I have given. Firstly, no know-how fees are included in these figures. However, some provision has been made for the influence of customs and clearing charges in the case of intermediates. The cost of imported machinery also includes customs charges.

Dr. C. B. Singh: Coming to research, which is important, is the research of German industry done in universities or is it organised by the industries themselves? Where do you spend the money on research? Is it on universities or factories or your own laboratories?

Mr. G. Albrechtskirchinger: I can answer this question in general terms only because I do not have any exact statistical material on it. In Germany we have a free and liberal economy and it is up to the individual entrepreneur to do what he wants. But since we are in a very competitive world where the mere survival depends on efficiency and progress, in Germany the companies have been spending a large amount on research and development in their own company. So far as the chemical industry is concerned. I think one could blindly say that a greater part of the new research in modern chemicals, drugs and insecticides is carried out by the industry itself. Any great industry in Germany must have its own centralised research institutions. However, we co-operate very closely with purely scientific institutions.

Quite often the industry finances certain projects in certain institutions and laboratories of the universities. They request the universities to work on certain problems in their laboratories and finance such projects. But, as far as the expenditure in the university is concerned, it is considerably less. It must also be said that the aim of their research is also somewhat different.

Dr. C. B. Singh: Is their any method of coordination between these agencies so that there should be no duplication?

Mr. G. Albrechtskirchinger: The research being carried out in the chemical industry and in chemical research institutions can very well easily be coordinated and there is no difficulty. Most of the research work done by Universities is known to every one in the field—so this sort of coordination, to the best of my knowledge, is very smooth and does not present any great problems. However, it is evident that research carried out in the industry laboratories is, of course, done behind the scene until patent application is filed.

Shri Arjan Arora: From this diagram of yours, Patent applications in Germany during 1905—1965 national and foreign applicants, it appears that Common Market has led to an increase in application.

Mr. G. Albrechtskirchinger: Sir, this is correct. I think this increase, it would be worthwhile if I give you some of the exact figures over the last year, there has been a very steady increase and I am personally convinced and it is confirmed by all experts that the beginning of the increase was accompanied by a great deal of inflow of, I must now say, extra European influence of technology.

Shri Arjan Arora: Would you give us the record of the foreign applications according to their origin from the British or the Common Market?

Mr. G. Albrechtskirchinger: I can do this easily.

Mr. Chairman: You can send it to us.

Mr. G. Albrechtskirchinger: I can send you the complete statistics

Mr. Chairman: Have you got one common patent office?

Mr. G. Albrechtskirchinger: This is a project under consideration. We have a Draft Model Law of a European Patent which is drafted for these countries.

Shri Arjan Arora: You said you have Draft European Patent Law of the Common Market Area which talks of 20 years. Is 20 years period of patent the rule of any country today?

Mr. G. Albrechtskirchinger: The period is usually, the average might be, around 18 years.

Shri Arjan Arora: Am I correct to say that 20 years period is nowhere the law today?

Mr. G. Albrechtskirchinger: I would say the tendency goes for 20 years.

Mr. Chairman: He wants to know if 20 years period prevalent in any country today?

Mr. G. Albrechtskirchinger: I Will have to look into this. In my own country it is 18 years.

Mr. Chairman: You may include this also in the note which you will send.

Mr. G. Albrechtskirchinger: I would be glad to do that.

Shri Arjan Arora: May I know, from referring to this statement, about royalty paid and received, who are the countries to which you pay the royalties? Are these countries member of the European Common Market or the North Atlantic Treaty Organisation which you have on your soil?

Mr. G. Albrechtskirchinger: I would say, generally speaking, the main line is the following: We pay the most to those countries where the technology is comparatively more advanced. In the chemical field, for example, we pay a considerable amount to Switzerland where our balance is more negative as compared to other countries. Overall, I would say these are industry figures as such, i.e. they relate not only to the chemical industry but to the industry as a whole.

Mr. Chairman: Have you got country-wise break-up?

Mr. G. Albrechtskirchinger: I have got country-wise break-up. I feel, Mr. Chairman, it is much more explanatory if complete statistics are submitted.

Mr. Chairman: Please furnish the same.

Mr. G. Albrechtskirchinger: I will furnish the same.

Shri Arjan Arora: You have given two statements: one relates to the period 1905—1965; the other to the period 1950—1965. The figures on royalties paid relate to the period 1950—1965. Could you give us the other statement from 1905 onwards also?

Mr. G. Albrechtskirchinger: I will try to find and furnish this to you.

Shri Arjan Arora: If you find it will help us to compare.

Mr. G. Albrechtskirchinger: I will try to do it.

Shri A. T. Sarma: Do you consider that this Bill has been drafted to improve the existing Patent Law in India?

Mr. G. Albrechtskirchinger: I would say, Sir, I do not question the motives. This is quite clear the attempt is made to improve the legislation. I would say it is necessary to adapt the legislation to changes in technology. However, we do not believe that the measures taken, which are proposed in your Bill, will serve these cards. On the contrary we believe that since one of the main motivations is to get at the problem of prices the measures are completely inadequate. The results may be contrary and you have to think on different lines. It would be more farsighted to give a very sound protection to your own creative thoughts in your country. Overall, I may say, I would not at all regard it as an improvement. I am sorry to say, I would not regard it as an improvement.

Shri A. T. Sarma: My point is, whether it is an improvement or not.

Mr. G. Albrechtskirchinger: No. I may say....

Shri A. T. Sarma: You may differ on certain points....

Mr. G. Albrechtskirchinger: I said very clearly that this Bill, as it is drafted now, in my opinion, would

be no improvement on your existing patent law.

Shri A. T. Sarma: So, you reject this Bill totally?

Mr. G. Albrechtskirchinger: No, Sir. I did not say that. I started my statement with the following words that any patent legislation anywhere in the world needs, from time to time, an adaptation to changing technology, to changing world factors and so on and so forth. We also change our patent law from time to time. This is quite normal.

Shri A. T. Sarma: In your concluding remarks, you said that in passing this Bill, the Indian Parliament will take a step backward.

Mr. G. Albrechtskirchinger: Yes. This is precisely what I said and I repeat it.

Shri A. T. Sarma: Again, what you say is self-contradictory. Is it an improvement on the present law or not?

Mr. G. Albrechtskirchinger: I think I made my answer quite clear.

Mr. Chairman: It is all right.

Shri Dalpat Singh: You said that there are so many applications from abroad for the patents that the Patent Office cannot cope with the work and that there is the need for simplifying the procedure. May I know what are the main points for your law of patents to be simplified according to your opinion?

Mr. G. Albrechtskirchinger: I can very briefly outline them. The amendment of this law is under consideration by our Parliament. It does not touch the substantive patent law but only the procedure. What we want to bring in is a so-called deferred examination. In other words, you would first grant the protection for a limited number of years and there will be examination only on a special application filed either by the patentee or by a third party. By doing this, one would arrive at the fact that a great many of the applications filed will be, after five or seven years, dropped automatically. This is true because it is quite known that the inventor, for a number of reasons, as soon as he invents something, files the application. It is only later that he can find whether it can be worked or it is worthwhile or useful. If it is not found useful, he will drop it. So, if you start the examination later, you can eliminate a great deal of labour in your examination procedure. This is an important issue. We will have to do it in Germany because we have a back-log of more than a quarter million applications which have not been handled yet.

Shri Dalpat Singh: What is the usual time taken in granting the patent, that is, between the date on which the application is made and the date on which the patent is granted?

Mr. G. Albrechtskirchinger: Now, in Germany, the average time taken is between five to six years. The German Patent Office is completely overloaded and we have to resort to deferred examination.

Shri Bade: In your statement you have said that the total number of foreign patent applications in 1965 is 42.65 per cent. May I know, out of this number, how many applications are for pharmaceutical industry and how many are for other industries?

Mr. G. Albrechtskirchinger: This is impossible to arrive at because cur classification as such is not separate. I am sorry I cannot answer this. The only thing I can tell you is the percentage of the turnover of the pharmaceutical industry in Germany is 10 per cent of the total chemical industry.

Shri Bade: On p. 5 of your Memorandum, it is stated:

"Non-working of patented inventions in India will often be due to factors completely outside the patent field and the grant of compulsory licences will be no remedy in such cases."

What are those factors according to you?

Mr. G. Albrechtskirchinger: First of all, the non-working of a patent as such, in our opinion, is not yet a criminal act because, as I have pointed out before, it must be a patent which is worthwhile and which can be useful. In other words, the mere statistical number will not give a clear indication. In India, you can find how many patents are granted and how many are worked but that is not a clear indication of the state of affairs because you would have to differentiate which of the patents are really held for the entire period and which can be used for commercial processes. Then, there may be a patent which may not be worked and its non-working may be detrimental to the country. Here comes the compulsory licensing regulation. If its non-working is detrimental to the country, I think, this should be the guide-line for any compulsory licensing regulation.

Mr. Chairman: That is what is provided in the Bill.

Shri Bade: Yes; that is the purpose of the Bill.

Mr. Chairman: You may not find it profitable to start its manufacture here. But if an Indian national or somebody else says that he wants to have a licence to manufacture it, why should it be denied to him.

Mr. G. Albrechtskirchinger: I realise this. Our objections are only to some specific parts of it, not against the general provision of compulsory licensing as such.

Mr. Chairman: If it is in public interest, it could be done.

Mr. G. Albrechtskirchinger: These things have to be carefully thought over. If it is only the non-working, that is not enough. It must be more than that. It has to be seen whether it could be done. There are other reasons outside the patent field which restrict this. Again, it is to be seen whether its non-working if detrimental to the public interest.

Mr. Chairman: It is only under such circumstances that licences are granted.

Shri Bade: You have attacked the biggest portion of Clause 87, *i.e.*, chemical substances. You have stated that substances aid if there is compulsory licensing in regard to chemical substances, then there will be no invention in India. But you have not stated anything about drugs, *i.e.*, 87 (a) (i) and (ii). But about (iii), which is the biggest portion of this Clause, you have said that the method of process or production of chemical substances should not be compulsory and that there should not be automatic licensing.

Mr. G. Albrechtskirchinger: I am very glad you have brought out this point. I have singled out this Clause in order to show that this 'automatic licensing', as I chose to call it, applies to all the chemical industries, and I think that it will not be a good thing for your country. It is needless to say that it is not advisable to apply it also for any other sector of the chemical industry, for example, drugs and so on. I think the normal procedure of compulsory licensing should suffice.

Shri Bade: In India, 90 per cent of the patents are given for food and drugs. If they are patented, then they have the monopoly for exploiting the poor people in India; if they are not patented, any manufacturer from Italy or Japan or any other country can come and compete with the patented medicines.

Mr. G. Albrechtskirchinger: To this question, of course, a great many

things can be said and should be said. The fact is that we consider things differently. As I have tried to point out before, the fact that 90 per cent are foreign applicants in India is a mere indication of the fact that the industrial development of this country has not yet sufficiently advanced to provide another ratio. As soon as more industrial developments takes place here, you will have more applications from your own nationals and the ratio will be different. But, in our personal opinion, this is not something to be afraid of.

As far as monopoly is concerned, I want to say the following. We have tried to point out to you under what conditions chemical productions are made in this country. You see the difference in prices. We are certainly not responsible for the prices. These are economic matters, in which patent law plays no role whatsoever. You might say that we have the example of drugs costing so much here. For this we have already supplied you the reasons. If you want to produce a complicated drug in a commercial scale, the pre-requisite for it is a well-balanced structure of chemical industry where intermediates and everything else that you need are available at reasonable prices. Patent monopoly, as a price factor, according to our experience is completely negligible in this country; it does not amount to anything. The only way in which you can lower the prices of these very important commodities in India is to develop your own industry to the utmost, to co-operate with the so-called foreign collaborators that are coming and to provide all the basic organic chemicals and intermediates which are necessary for complicated final products. This is, if I may say so, our advice on this issue.

Shri B. K. Das: In your Memorandum you have discussed about the use of inventions for purposes of government. On page 7 you have said that the use of invention for the purposes of Government must be strictly limited to use by government only. Do you mean both Central and State Governments?

Mr. G. Albrechtskirchinger: As far as this terminology is concerned, it was not thought to make an difference between State and Central Governments. The idea was that this sort of measure should be restricted to government authorities.

Shri B. K. Das: Should it also be in cases of national emergency; for example, widespread epidemic or something like that?

Mr. Chairman: The Central Government will decide. In national emergencies, the States have no power. It is for us to decide. Why should we ask him about that?

Shri B. K. Das: I wanted to have a clarification from him as to what is his idea about national emergency.

Mr. G. Albrechtskirchinger: I can give a general answer to that, but not a specific answer. We consider those measures, that is to say, uses by the Government for purposes of government, as very extra-ordinary measures which should be used only when there are over-riding necessities. For example, in my opinion, an epidemic disease, a revolution, war, famine or things of that sort would be the principle. Of course the question must be decided whether the use of patents in that particular case would remedy the situation. I may point out that we do have a similar clause in our German patent law which, if translated in English, means "public welfare". There must be reasons of public welfare and in that case, the Federal Government of Germany, that is to say, the entire Government and not an individual cabinet member, may issue an order that an invention, a patent, may be used for government purposes.

Mr. Chairman: Yes; you have that provision; it is possible by an order of the Government in the interest of public welfare....

Mr. G. Albrechtskirchinger: It is not a free use. First of all, the decision can be contested, secondly, there is remuneration provided in the law.

Shrimati Sharda Mukerjee: In one of the statements you have given to us, you have given Germany's balance of royalty payments over so many years.

I would like to know what amount of this was recovered in export trade. You have given us a statement showing the royalties paid and received in the Federal Republic of Germany for inventions, processes, copyrights etc. Could you give us as to what amount of this is realised from export trade? You say that the position has improved considerably and you do not have to give out any money and you are benefiting to the extent it is minus. Can you tell us what would be the export trade on this, on these commodities you manufacture under patent protection with foreign collaboration?

Mr. G. Albrechtskirchinger: I am sorry I will not be able to give this information readily as I do not have any additional statistics with me. Secondly, this table shows the balance of payments position for the entire German industry and your specific question, I think, refers to chemical products.

Shrimati Sharda Mukerjee: Actually what we find in India is that there is hardly any export from industries where they have patents with foreign collaboration. Export market is more or less shut out for us.

Mr. G. Albrechtskirchinger: I think they pay royalty to the foreign concerns.

Shrimati Sharda Mukerjee: But a great deal of it is recovered as they attract export markets whereas the things that are manufactured in our country are actually for domestic markets.

Mr. Chairman: You pay royalty for things manufactured in your own country under foreign patents and you export them. What is the export earnings of your country on that account?

Mr. G. Albrechtskirchinger: I have no information with me now. I am very sorry indeed. In order to answer your question we have to have exact statistics. At best I could only make a guess.

Shrimati Sharda Mukerjee: As has been brought out by Justice Ayyangar in his report on the revision of the Patents Law, while the working of Patent law in European countries may be effective and successful, it is a different matter with us because here it is fairly a domestic market and we have to safeguard the interests of this country. This Bill has not been modified in haste. We have an elaborate report on the Patents Law by an eminent Judge who has gone into it in detail and it is because the patents were not worked for the benefit of India that we have been forced to have this modification. Just for instance, one of the main reasons why this compulsory licensing had to be introduced is, as Justice Ayyangar has brought out, that the patents which were granted were not worked in India. Your first point was that compulsory licensing would be a regressive step.

Mr. G. Albrechtskirchinger: I should like to say the following regarding this. I do not mean in any way questioning the soundness of a compulsory licence. If you misunderstood me, I would like to clarify, I also believe and I would also like to repeat it that in a country like India where you have obviously an interest that inventions which are protected here are being worked and if you decide to have provisions in your Patents Law that guarantee the working of patents, I think, this is in principle something which is quite acceptable. The only thing that I mentioned is that there are many factors for the non-working of patents which are completely outside the patents sphere. In other words what I tried to say was that every case has to be decided on its

individual merits and nas to be carefully decided. This is what I wanted to convey. The licence of right regulation is, in my opinion, in a completely different sphere, because there you should have a procedure which considers every case upon application and so on and so forth. But you subject the entire chemical industry to a sort of automatic compulsory licensing and this will have completely different effects. In other words, this would mean this: that for any chemical invention—not only pharmaceutical—patent protection in India would practically no longer exist because any one who would have a patent here would immediately have to share it without any restrictions with any one who comes and wants to work it. It would be completely automatic. This is one of our main points here that we would strongly underline. It should be only in cases of misuse but by subjecting the entire chemical industry to this sort of treatment, you will not arrive, in our sincere opinion, at results which the framers of the Bill might have in mind.

Shrimati Sharda Mukerjee: I am afraid it does not convince me. Unfortunately we have to modify this.

Mr. Chairman: That is another matter.

Shrimati Sharda Mukerjee: If we have perfact market conditions like competition, then it would be a better thing to pay 4 per cent royalty on the licence of right. That may be all right for countries which are industrially developed but for a backward and undeveloped country, I think, the protection needed is higher.

Mr. Chairman: That we will discuss later.

Mr. G. Albrechtskirchinger: Internally even a country like India is very much in need of competition because it is a constant check on one's own efficiency.

Shri Shyamnandan Mishra: One point which has very much exercised the minds of Members is about the price and the cost of production. The learned witness has told us that much of the increase in cost of production is the national contribution; that is, it is India which has to account for much of the increase in the cost of production of certain of the materials, in construction and the price of indigenous machinery, etc. Would he be kind enough to tell us as to what extent the contribution is national. He has given us certain figures. Can he tell us, in terms of percentage, the increase in cost of production due to national factors and to what extent it is due to external factors?

Dr. Ulrich Heubaum: In the graph we have supplied you, there is a breakdown. Here one can see that in these cases of investment-costs the percentage of imported materials is about 20 per cent. This means that they have to pay 20 per cent on imported machinery customs and clearing charges. On this 20 per cent, they have to pay in this specific case about 5 per cent; that means 25 per cent clearing charges and customs.

Shri Shyamnandan Mishra: You have given us certain figures with regard to the expenditure incurred on research and development in the Federal Republic of Germany. How much of this expenditure is contributed by the patentee manufacturers and how much by non-patentee manufacturers?

Mr. G. Albrechtskirchinger: The figures which we have given in this table are the research expenditures of the chemical industry. The core of your question is who actually pays it. I can quite clearly tell you that they are the ones who are in research and the ones who have patents. And may I tell you one thing? Any company to-day in Germany of any importance which brings out products to the market which are really new, which are important, which mankind is in need of, does research. This is basically the question. They are the research-minded men, they are the progressive

ones. In Chemistry nowadays, without research there is not very much that you can do, except may be some very simple products where there is no technological advance possible and which is really not chemistry but just mixing two or three things together..

Shri Shyamnandan Mishra: My point is, what is the amount these patentee manufacturers spend inside Germany on research and development. They may be carrying on research and development outside Germany if they happen to be foreign patentees. They may not be spending all that amount in Germany.

Mr. G. Albrechtskirchinger: The figures that I have here, to the best of my knowledge, refer to expenditures in Germany. Of course, this is also a centre of research activity. We have certain co-operation also in research which is carried outside of the borders. But to the best of my knowledge, most of the research is in Germany.

Shri Shyamnandan Mishra: Regarding product and process, I would like to know to what extent in Germany you have got process patents. Or, are all of them product patents, because you seem to be telling us something which is not very much in keeping with the proposed Bill of ours?

Mr. G. Albrechtskirchinger: The German Patent law from the very beginning provided, generally speaking, product protection with the following exceptions: "inventions relating to foodstuffs, luxury products"—here the English translation, 'luxury goods' is not correct, for it actually refers to coffee, tea, cigarette and things of that sort—"and medicines as well as to substances produced by chemical processes in so far as they do not relate to a particular process for the production of these articles." So, in other words, food and chemical inventions, ever since the beginning of the German patent law, have had only process protection. In the modified form, the protection is extended to the product which is the result of this process.

Shri Shyamnandan Mishra: What is the proportion of the process patents in your country?

Mr. G. Albrechtskirchinger: Globally I can tell you that the German chemical industry gets roughly 15 per cent of all the patent applications filed and takes the second place right after the electrical industry and I would have to look up the statistics for food and medicine; if it can be done, I will be able to supply the information.

Mr. Chairman: I am reading from a quotation of German law. "Inventions, the utilisation of which would be contrary to law or public morals, inventions of articles of food, and taste, medicines and substances which are produced by chemical processes, in so far as the inventions do not concern a specific process for the preparation thereof, are not patentable. Processes for preparing articles of food drugs and medicines are, however, patentable." Is this correct?

Mr. G. Albrechtskirchinger: The wording may be different, but in substance it is correct.

Sardar Daljit Singh: Is there any control of the price of the patent drugs in Germany and if so, what measures are being adopted to check high prices?

Mr. G. Albrechtskirchinger: We don't have any price control of patented articles; this has never existed anywhere in Europe, to the best of my knowledge. Price control has applied to a certain group of commodities whether they be patented or not patented. In other words, price control which has its legal backing in some special statute has, of course, been in existence in a number of countries. To the very best of my knowledge, in pharmaceuticals, this does not exist in Germany. In the chemical field, there have been in the past certain regulations on prices for fertilizers and some other industrial products.

One thing I want to make clear, the German legislator has never adopted the way of saying because a product is patented, there should be price control. He only took from time to time certain commodities as a group. Does that answer your question?

Shri Kashi Ram Gupta: In view of the fast progress of technology in chemical industries, the expert opinion is that a patent these days goes out of use within a period of 10 years. Are you of this opinion, or if you have a separate opinion, please let me know?

Mr. G. Albrechtskirchinger: No, I am not of this opinion that due to the fast technological change, the life span of a patent in the chemical field or in general should be shortened. On the contrary, one of the main reasons for having a strong patent protection is to provide the very basis that we do advance technologically and that we do go ahead very fast by virtue of a patent system which is strong and which also provides adequate returns. You must always allow to the patentee a certain period in which he can try to perfect his methods, to go beyond the laboratory stage and use the product commercially and also prepare the market in order to have a certain return on the investments he has made for his research. These two issues are separate.

Shri Kashi Ram Gupta: You have talked very high about the Model Law. The Model Law on its page 49, gives a commentary that if a patent is given for 10 years after grant of the patent, it can also suffice. What is your opinion about this? It is on page 49, minimum period of 10 years can be there after the date of grant of the patent.

Mr. G. Albrechtskirchinger: Is that adequate time—is that the question?

Mr. Chairman: That is what the Model Patents Law says on page 49.

Mr. G. Albrechtskirchinger: Unfortunately I do not find it. My paging here is different. Anyway, as far as I understand the question, there is need for a period of 20 years roughly after filing.

Shri Kashi Ram Gupta: It is 10 years in the Model Law.

Mr. G. Albrechtskirchinger: This depends of course on the lapse of time which was needed. . .

Mr. Chairman: That is why they have fixed the date after the grant of the patent.

Mr. G. Albrechtskirchinger: Well if you fix the date after the grant of the patent, this has to be studied closely. I think in most cases it will arrive at a very satisfactory solution. It would have to be studied closely.

Mr. Chairman: It is quite satisfactory.

Mr. G. Albrechtskirchinger: I would tend to believe that this might be satisfactory after the grant.

Mr. Chairman: Whatever may be the time taken in preliminary procedures, it is satisfactory.

Mr. G. Albrechtskirchinger: The difficulty is following. I think you have to look at the situation in individual countries. For example I do not know—and I cannot judge—what the special conditions are in India to arrive, for example, at the additional steps which are necessary on clinical tests and that sort of thing and the administration of drugs as such.

Mr. Chairman: What may be the time taken in preliminary procedures, if 10 years period is taken for a patent, would that be sufficient? That is the Model Law which has not yet been adopted by many countries.

Mr. G. Albrechtskirchinger: Well, it depends on the length of the procedure.

Shri Kashi Ram Gupta: You have just mentioned in your statement that

in Germany, the Patent Law is for a period of 18 years and about 5/6 years are taken for granting the patent. It means the period after the granting of patent remains only 12 years. So 12 years or 10 years, there is a difference of only two years.

Mr. G. Albrechtskirchinger: This, of course, is one thing. If I may explain in detail, after the filing of a patent, we have a public notification after a certain time and from the beginning of this notification you have provisional protection although the patent is not yet granted. In spite of my statement, it is quite correct that the present state of affairs in Germany which needs an excessively long examination procedure is detrimental to the patentee, is detrimental to the patent system. Whether you have a patent granted or not is not decided early enough. This is also one of the reasons, apart from the fact that it would help our Patent Office, why we want to change the procedure.

Mr. Chairman: We are concerned with the present conditions, not with what happens in the future. It gives 12 years after the patent is granted. We have put 14 years. What is your objection? You cannot have any objection.

Mr. G. Albrechtskirchinger: There is one thing there, Sir. As far as pharmaceutical products are concerned, it is not 12 years. Our patent is 18 years from the time of filing the application.

Mr. Chairman: Even in this case, even for 10 years he gets all the rights. It dates back to the date of application.

Mr. G. Albrechtskirchinger: That is different. It makes a little difference. We have 18 years from the date of filing. In your present draft, it is proposed to shorten it to 14 years. This is an intermediate step.

Mr. Chairman: It takes 3/4 years. What can be your objection?

Shri Kashi Ram Gupta: Japan is said to have a very strong Patent Law at present. Are you agreeable to it? And if so, you should know that Japan has got **15 years** period for a patent from the date of filing of the application.

Mr. G. Albrechtskirchinger: I am not familiar with the particulars of the Japanese patent system. There are good many variations in different countries. The period averages above 15 and between 15 and 20. International tendency is towards 20 years. I would prefer that the question about Japan be put to some one who is more able to answer it.

Shri Kashi Ram Gupta: Is the chemical industry and the pharmaceutical industry spread over the whole country or is it concentrated near Frankfurt and all these places?

Mr. G. Albrechtskirchinger: Sir, we have chemical and pharmaceutical industry, more than 2000, probably 2,500 different companies. Of course, among these, there are some which are quite large; they are the one which produce everything in chemicals from basic things to very refined products. They are located geographically mainly along the Rhine river, for technological reasons because they need a lot of water which is cheap for cooling purposes and production processes. They may be about 50. The climatic condition is roughly the same, as the country is small.

Shri Kashi Ram Gupta: It is not a tropical country, and air-conditioning etc., may not be needed there. Is that a reason for reduced cost of production?

Mr. Albrechtskirchinger: It is a small item; it is mostly a question of the size of the unit. Of course, tropical conditions can increase the cost of production.

Shri Kashi Ram Gupta: Is the pharmaceutical industry more profitable in Germany compared to other

industries. do they declare more dividends and are their exports the highest?

Mr. G. Albrechtskirchinger: For that we will have to make an analysis of company reports in Germany.

Mr. Chairman: You gave us figures to show that you are paying more royalty to foreigners than the roya ty coming to Germany, more than double. What is the percentage of royalty you are paying for the foreign patentees?

Mr. G. Albrechtskirchinger: It varies from 2 to 12 per cent, and depends on individual contracts. It depends on the merit of the product in question, and even pharmaceuticals cannot ask for a higher royalty because there are competitive materials, and only the difference between what is already available and whether the other product is superior counts. So, if there is an excellent new dye stuff, for instance, the royalty can be higher than for a pharmaceutical which does not have such comparable quality.

Mr. Chairman: In your patent law, you have got a provision for compulsory licensing and also licence of rights in the public interest?

Mr. G. Albrechtskirchinger: Yes, in section 15.

Mr. Chairman: Similarly you have a provision for revocation of patents?

Mr G. Albrechtskirchinger: Yes, in section 8.

Mr. Chairman: You have got a provision for endorsement of patents, analogous to the provision for licence of rights in our Bill.

Mr. G. Albrechtskirchinger: Yes. but we do not call it licence of rights in the terminology of your Bill. A patentee can voluntarily grant a licence to anyone.

Mr. Chairman: Thank you very much. We have taken a lot of your time.

Mr. G. Albrechtskirchinger: Mr. Chairman, it is our duty to thank you and the Members of the Committee for the patience and the interest that you have shown. Thank you very much.

(The witness then withdrew)

(The Committee then adjourned to meet again at 14.30 hours)

(The Committee reassembled at 14.30 hours)

II. Centre Europeen Des Federations De L' Industrie Chimique Bureau, ZURICH.

Spokesmen:

1. Mr. R. A. Willens, Head of the Patent Department of Shell Chemicals, London.
2. Mr. J. Egli, Director of the Swiss Society of Chemical Industries.
3. Mr. Haslam, Head of the Patent Department Welcome Foundation Ltd. London.
4. Mr. D. H. Nowotny, Delegate of Swiss Society of Chemical Industries, Zurich.

(The witnesses were called in and they took their seats)

Mr. Chairman: Gentlemen, whatever evidence you give is printed in the Parliament and laid on the Table of the House. It might be distributed to Members. Even if you want any portion of it to be confidential, it will be printed and distributed to Members and laid on the Table of the Houses of Parliament. The Members have received your Memorandum. It has been distributed to all the Members. If you want to add anything to it, you may kindly do so.

Mr. J. Egli: Mr. Chairman, Gentlemen: On behalf of CEFIC, I like to express my sincere thanks to you, Sir, and to the whole Commission of the Indian Parliament for giving me this opportunity of participating at these hearings. I am extremely impressed by the manner in which you organise these

hearings and let me say that it is very rare in the world that a Parliamentary Commission is receiving foreigners to testify. For this very great generosity of your Commission, I would like to express my admiration and my sincerest thanks.

The subject of the Indian Patents system is so wide and complicated that for the benefit of the hon. Members I have taken the liberty of being accompanied by some very competent colleagues who will assist me in answering questions which the Commission would like to ask. May I just briefly introduce my colleagues? That is Mr. Willens on my right side, Head of the Patent Department of Shell Chemicals, London; Mr. Haslam, Head of the Patent Department of Welcome Foundation in London; and Mr Nowotny on my left side, a delegate from our Society—the Swiss Society of Chemical Industries in Zurich.

Before I begin with some points, I would repeat once more that I can assure you that I do appreciate this gesture to have the opportunity to be here, as I consider that gesture of a great Democratic country as your country is.

In addition to what has been said in the CEFIC Memorandum of January 5, 1966, mention should be made of the following points.

The first point is: CEFIC means the Centre Europeen Des Federations De L'Industrie Chemique. That would mean in English, freely translated, European Centre of Federations of Chemical Industries. This Centre is composed of the National Associations of the chemical industry of the following countries: Austria, Belgium, Denmark, Finland, France, Germany, United Kingdom, Italy, the Netherlands, Norway, Sweden and Switzerland. It practically covers the entire chemical industry of Western Europe. The Chemical industry has numerous branches of manufacture and in what will follow I shall confine my remarks to only the most important of these, *viz.* the manufacture of inorganic and organic chemicals. They form the starting materials for many other branches of the chemical industry engrossed in manufacture of specialised products. In the case of inorganic chemicals, basic materials utilized are minerals, such as sulphur, pyrites, salt, and so on; while in the case of organic chemicals, basic materials are coal, on the one hand, and crude oil, on the other. These natural products are converted by what we shall call the basic chemical industry into a variety of further products, which, in turn, constitute the starting materials, utilized by the specialized chemical industries for the production of *e.g.*, dyestuffs, plastics, pharmaceuticals and many other classes of compounds.

From the above it is clear that the chemical industry represented by CEFIC is vitally important to the chemical industry as a whole. To use an analogy, were one to consider the entire chemical industry as a column, the portion we represent would constitute the base, the removal of which would cause the entire column to collapse; that means that the pharmaceutical industry and other highly specialised industries would be deprived of their sources. During the past 20 years, the chemical industry has progressed tremendously. In the 12 countries of CEFIC, the 1963 turnover was 24,400 million US dollars. This represents approximately 29 per cent of the entire world production of chemicals. By 1964, the turnover has jumped to 27,100 million dollars. As this 1964 figure still represented 29 per cent of the world production, the chemical industry made tremendous advances throughout the world and the effects hereof were also noticeable in India.

It is a well-known fact that the European chemical industry adheres to and defends a most liberal commercial and economic policy. That this is so, is borne out by the statistics of foreign commerce in the chemical sec-

tor. In 1964, for example, the 12 CEFIC countries exported chemicals to the value of 6,587 million United States dollars, while in the same period, the imports amounted to 4,938 million dollars. In 1963, the imports were 3,994 million dollars, and the exports were to the value of 5,583 million dollars.

Numerous factors are responsible for this extraordinary state of affairs; let us consider only the most important. In almost all the countries concerned, the Governments have granted the manufacturer appropriate protection for his inventions and except when serious problems arise with respect to location and the supply of raw materials, a rapid growth of the industry resulted. The protection of the inventions made by the manufacturer thus represents a most important factor in ensuring a favourable climate for unhindered growth of industry. This point of view is shared by leaders throughout the world, and the Secretary-General of the United Nations, Mr. U. Thant, commented as follows on this very point:—

"Firstly, patent protection has encouraged research and invention, secondly, it has induced the inventor to disclose his discoveries instead of keeping them as a trade secret, thirdly, it has offered a reward for developing inventions to the stage at which they are commercially practical, and fourthly, it has acted as an inducement to invest capital in new lines of production which might not appear to be profitable if many competing producers embarked on them simultaneously."

In studying the economic situation of a country, it is necessary to investigate the import and export regulations, the customs duties levied on imports, possible import restrictions, the financial situation within the country, foreign debts and the attitude of the government towards foreign capital investment. A further most important aspect which is always considered is the extent to which the national legislation provides protection for industrial property: when such protection is either absent or meagre, the climate for foreign investments of any kind is seriously impaired. When industrial property is not adequately protected, not only is the national inventor handicapped, but foreign inventors are given no assurance that their efforts and financial risks will be adequately rewarded. Under these circumstances, they will prefer to turn elsewhere to extend their activities with the result that industry in the country concerned will stagnate or even receive a serious setback.

It is to be expected that in the event of some of the provisions currently contained in the Indian Patents Bill becoming law, foreign investors would be discouraged from continuing to invest capital in India. The contribution of foreign industry towards the steady development of the Indian economic standards may be assured if the Government of India creates the right climate for the protection of such capital. The provisions contained in the present Bill not only do not create such a climate but tend to destroy it.

Turning to my point No. 3, it must be borne in mind that one of the prime objects of strong patent protection is to make possible the recouping of research expenditure. In this respect, the amount spent on chemical research (including pharmaceutical) is tremendously high in Europe. Its exact total figure is unknown. In Germany, this expenditure is approximately 300 million dollars per year, and in Switzerland, it reaches an yearly amount of about 170 million dollars. It would be an error to think that the progress could continue if research were to be curtailed and it is equally as obvious that the products of today must necessarily bear the research costs of tomorrow.

Due to the flexibility and open-mindedness of the chemical industry, this industry has not shirked from the task of building its factories outside Europe. Your own country is an elo-

quent proof hereof, as a number of European-based chemical enterprises have opened factories in India. The European chemical industries in addition strive for the removal of barriers to trade and progress, and the industry is of the firm opinion that the greater the exchange of goods and know-how, the greater will be the chances for the raising of the population standard of living. It is my conviction as well as that of my colleagues that it would have been impossible for the chemical industry in Europe to have attained the heights which it has done in so short a time had not industrial property been sufficiently protected It is because of our firm belief herein that all steps undertaken with respect of patent matters in Europe are aimed towards the strengthening of the patent system. In this respect, you are undoubtedly aware of the European patent convention envisaged by the common market countries. In urging you to introduce strong patent protection in India, I merely suggest that you adopt that type of Bill under which so many countries of the world have prospered.

4. The main problem underlying the discussions on the Indian Patents Bill is whether India will really be better off by restricting the rights of patentees, in the chemical field by making patented inventions more freely available to the public and the Government as envisaged in clauses 48, 87, 88, 93(3), 95(3) and 99 to 102.

My Organisation believes that this liberalisation is not in the true interest of the Indian economy. While a transient advantage might be gained here and there on prices, in the main the weakening of patent rights will slow down the transfer of technology into India from the more developed countries and react unfavourably on the investment climate.

The role played by patents in the economic and industrial growth of a country is a long-term one. India is on the brink of a great industrial development and to weaken her patent system now will have effects which may only become apparent some years hence, by which time the damage will have been done.

The question of the role played by patents has been carefully studied in the two reports "The Role of Patents in the Transfer of Technology to Developing Countries" and "The Model Law for Developing Countries on Inventions". I believe the Committee is already aware of these reports. They are the result of a deep international study of the whole problem, in which study India took part, and it is emphasised what value a strong patent system has in developing technology in a country.

For example, the Model Law, in Section 35 allows for the grant of compulsory licences in certain vital areas, at any time, without the waiting time provided in Section 34; food products or drugs are mentioned as areas where certain countries consider such provisions necessary; but the Report emphasises that:—

> "This faculty should be used with measure and caution, because in all cases in which it is used it is likely to stifle invention, research and investment".

The document "The Role of Patents in the Transfer of Technology" analyses the effect of patents in the transfer of technology in the basic philosophy of the U.N. that the economic progress of the developing countries is a matter of concern not only to themselves but also to the world community at large, and that access to knowledge and experience in the field of applied science and technology is essential to accelerate the economic development of the developing countries and to enlarge the over-all productivity of their economies.

It is the experience of those countries which have had a well developed patent system that it has greatly stimulated the local introduction of foreign techniques to the country's overall economic advantage, though royalties

have had to be paid. My Organisation believes that it cannot be in the interests of India for patents in the chemical field to be so drastically weakened as is proposed in the present Bill.

5. Turning now to the actual text of the Bill, and in amplification of what has been briefly stated in the Memorandum, it may be observed firstly and in general that an important aspect of the advantages purporting to be conferred on the patentee is security which he ought to enjoy from the pirating by late-comers in the field of the development work that he will be persuaded to do in India.

As to the "rights" of the patentee these are the rights which the Bill legitimately purports to confer on an inventor and the mischief of the present Bill lies not only in the extensive limitations of those rights as compared with those considered appropriate in the experience of most countries of the world, but also the possibility that even these limited rights may be withdrawn at any time. The investor of capital and the importer of technical know-how in considering the protection afforded by any patent is obliged to take a pessimistic view that if his investment is successful the protection on which he is counting may prove to be a total illusion.

6. As to the detailed clauses of the Bill; regarded not from my own point of view but from that of a practitioner in patents, the following should be added to the substance of the Memorandum.

Clause 8

The duties laid upon an applicant under this clause are not only onerous in themselves but lay a very heavy burden on the Examining Staff of the Patent Office, to weigh up and assess the effects of the information that must be supplied under this clause. Indeed, we are far from wishing to be impertinent in saying, as a criticism of the Bill in general, that it will make much heavier demands upon the expertise of the Examining Staff than is the case with any or most of the Patent Offices of the world, who are themselves currently finding difficulties in securing adequate staff.

Clause 53

It is a fact that, with the increasing complexity of industrial operations, the existing terms of patents in many countries are proving to be unduly short, and the world tendency is rather to lengthen them than to shorten them, as in this Section. For very many important inventions the early years and sometimes even the later ones after grant, are still unprofitably taken up with development work.

Clause 76 raises an apparently small point but one of some constitutional importance, that the secrecy of communications to the Patent Office can be breached, not only by the order of the court but also under the executive direction of the Central Government, or even of the Controller notwithstanding that he is himself, presumably, an officer of the Patent Office.

Clause 87(1) is the clause more than any other that will prove a disincentive to investment in that it withdraws any possibility of exclusivity from the investor who wishes to set up a plant for the manufacture of chemical substances He may be all too sure that when he has gone to the expense of setting up a plant and overcoming the inevitable teething troubles, anyone may come and take advantage of his successful development work under a licence granted as of right.

Clause 88—On the subject of any arbitrary ceiling for royalties, it should be observed that a reduction of manufacturing costs is an undoubtedly laudable object of research and invention, and the effect of this provision is to reward an inferior invention more highly than a superior one which reduces the manufacturing cast to a greater extent.

In licence negotiations and other operations for the determination of

payments appropriate to reward a patentee while not unduly handicapping the licensee, the question of what form of product is to carry the royalty percentage is a very important and a very variable one. The provision of a fixed ceiling will unavoidably distort this question and prejudice the optimum conduct of the execution of the invention.

Clause 95(3)—It seems unjust that the licensee should be authorized to import a patented article while the patentee himself is debarred from doing so.

The final word of the Memorandum on the subject of the sale of licensed know-how is extremely cogent. Indeed the implications of the sale of know-how call even more loudly for re-assessment than plans for the investment of capital. The numerous and extensive provisions of the Bill for compulsory licensing and for the withdrawal of rights makes the retention of know-how the only defence in the hands of the would-be licensor. These provisions would encourage, where a licence is compulsory and unavoidable, the execution of a 'bare licence' unaccompanied by the detailed know-how necessary to take advantage of the licence. A licence can be compelled, but the transmission of know-how cannot.

It is in the light hereof that I should like to express on behalf of CEFIC the hope that the new Indian Patents Bill will be drafted in such a manner that it will ensure a sound basis for the harmonious development and expansion of the Indian industry.

Mr. Chairman, hon. Members of the Committee, may I once again thank you for the great honour you have given me to appear before you. My colleagues and myself deeply appreciate this very great gesture of a great democratic country.

Shri Bade: You object to clause 95(3). You object to this because the Government fixes the price. When the Government finds that foreign patentees have exploited our country and they have the monopoly also, they fix the price. Why should there be any objection?

Mr. R. A. Willens: I think the particular objection to this clause is that it grants a right to a licensee of an invention which right is denied to the patentee himself, namely, that of importing the necessary product. This seems to us to be unfair. I think this particular point would be met if the patentee is also authorised to import the product along with or instead of the licensee.

Mr. Chairman: If a patentee does not supply the required quantity of medicine or drug at a reasonable price and charges extortionary prices and the Government in the public interest feels it necessary to import such articles and fixes the price, why should you object to that?

Mr. R. A. Willens: I understand from what you say that this clause is designed as a penalty to the patentee; but it is not expressed like that—it simply says that if the Central Government considers it necessary in the public interest.

Mr. Chairman: Government will interfere only when it is necessary in the public interest; not otherwise.

Mr. R. A. Willens: There is nothing in the clause to indicate that the patentee was in any way at fault and yet the licensee is authorised to import.

Mr. Chairman: Suppose the patentee misuses his patent or does not work in the interests of the country and the Government feels that it is in the interests of the country to get that particular medicine or drug. What is wrong in their authorising the licensee to import the required quantity of medicines at reasonable prices?

Mr. J. Egli: May I ask Mr. Nowotny, who is specialised in this line, to give an explanation which could satisfy the hon. Member who asked this question?

Mr. D. H. Nowotny: You have been mentioning something about reasonable prices and I think concerning the draft Bill it is the crucial question What is the reasonable price? How do we determine what is a reasonable price? If I may re-state the question of the hon. Member, I believe what pre-occupies the hon. Member who asked this question is the following. Suppose a company has developed a drug, say in Switzerland. There is the well-known case of the active Substance of a tranquilizer being sold at Rs. 5,555 per kilogram and another firm delivering the same substance at Rs. 312. If I understood correctly, the hon. Member wonders if there is not some exploitation going on in this filed. In this special case, if the Government decides to fix the price of the substance at the low level of Rs. 312, we would not be able in Switzerland to cover our research cost and the return on the capital invested in this research. This is the only objection that we have and that is why we believe that patent protection is so necessary in this field. I may point out that the firm which is delivering this substance at Rs. 312 per kilogram has not done any research work at all. The originator of this drug, Roche has many years of research and development work to its credit. They have a large research staff in Switzerland, United States and the United Kingdom and this research staff cannot be diminished from one year to another. You know very well that if you have a qualified chemist or doctor on your staff, you will have to keep him on. Therefore, once we have built up a very competent team of research workers, our big problem is to obtain the necessary funds to finance the research that is going on, whether we make any profits or not. One of the problems that we always have to face is that people do not understand that there is a big difference between a company that does original work and one that does nothing at all and just waits for a drug to come out. I may also point out that an imitator, as we would like to call him, because he does not do any research work, is never interested in a medically successful but commercially unsuccessful drug. You probably know that 90 per cent of the products of a business usually make 10 per cent of the profits and the balance of 10 per cent of a company's products usually account for 90 per cent of the profits. I do not say that this rule is always valid but it gives you an indication. I think it is characteristic of the pharmaceutical industry. Out of 100 products that a pharmaceutical company may market there may be only 10 per cent or even less that are commercially successful products. We expect the successful products to pay more of their share than the other products do. This is a principle of justice which, by the way, has been accepted by the income-tax authorities in over hundred countries in the world. For every commercially successful drug there are many other drugs which are medically useful but which because of their limited use, do not attain a sufficiently high volume of sales. Therefore, the commercially successful drug has to pay for research and development.

Shri Bade: Clause 95(3) says that the Central Government will do it only if it is in the public interest so to do.

Mr. D. H. Nowotny: The point is what you mean by "public interest". If you say that this is only an emergency clause to cover cases like war or where the market has not been supplied sufficiently at reasonable prices then it is different. So, first of all, we have to consider whether there is an emergency situation and, secondly, whether the market has been supplied.

Shri Bade: There is no question of an emergency. The question is only of public interest.

Mr. D. H. Nowotny: Mr. Haslam would like to answer it.

Mr. Haslam: Clause 95 is concerned with the ground of compulsory licence under clauses 84 and 85. The object of these clauses is to prevent a patentee

from simply sitting on an invention and to encourage the working of the invention in India. The aim of this clause, which corresponds to the section which has been for a long time in the United Kingdom Act, is to encourage the actual production of the patentee's invention in India. It seems to us that clause 95(3) is illogical in the context of clauses 84 and 85 in that having granted a compulsory licence for the purpose of working the invention in India, clause 95(3) suddenly allows the Government to import the invention, which has the very opposite effect of encouraging the production of the invention in India.

Mr. Chairman: Suppose, there is an epidemic in India and we are in urgent need of a medicine. It takes years to establish a factory and produce the thing. In that case, why not import it under certain conditions certified by Government? What is your objection?

Mr. Haslam: I think there would be no objection to any clause which expresses this clearly in terms of an emergency. Naturally, nobody would want to impose any restrictions in the case of a national emergency or an epidemic.

Mr. Chairman: Do you think Government will interfere unnecessarily? Unless there is an emergency or some special reason Government will not interfere. I can give you an instance; such a case happened in India. The Director, Haffkine Institute had forwarded an application dated the 27th May, 1941, to the Controller of Patents for onward transmission to the Governor General in Council praying for the grant of compulsory licences under Section 22 of the Indian Patents and Designs Act, 1911 in respect of patents Nos. 26513 and 26850 granted to Messrs. May & Baker, London. Briefly, the grounds under which the application was based were as follows.

The heterocyclic compounds, sulphathiazole and its derivatives which form the subject matter of the patents have curative powers in the treatment of plague and a large number of other bacterial infections gonorrhoea and the infections of urinary tract. This drug was superior to anything invented before that nothing can take its place. In spite of the importance of the drug, the patentees who get their patent in June, 1938, did not put it in the market till about December, 1940 and the quantity of the drug offered to the public was considerably small. They did not supply the required quantities at a reasonable price. They said that they were unable to supply. They frustrated the Government of India in the grant of compulsory licence and importing this drug. In such a case do you think it necessary to have the powers read out by my hon. friend to import the necessary medicine in the public interest; or, do you want the Government to allow thousands of people to die of such cursed diseases?

Mr. Haslam: Certainly not. Nobody would want to impose restrictions in circumstances of that kind. This section, however, I think, refers to "in the public interest".

Mr. Chairman: You can rest assured that only in such cases the Government will interfere and not in other cases.

Mr. Haslam: "Public interest" may be a short-term emergency or may be a long-term one. My understanding of the meaning of "public interest" as being behind this compulsory licence section is the long-term one, that is to say, the advantage of developing industry in India as opposed to importing patented goods from abroad. That is obviously something that is not done overnight; it has a long-term meaning.

Mr. Chairman: We are not concerned only with the development of industries but also with the health of the nation.

Mr. Haslam: I think, there would be no objection to a section which

said that the Government had the right in an emergency to import drugs notwithstanding any licence and so on.

Mr. Chairman: You have got similar provisions in the UK Act and also in the Patents Acts in Switzerland.

Mr. Haslam: Yes, Sir.

Shri R. P. Sinha: May I add that in England there was a case where the Health Ministry started importing large quantities of drugs for use in the National Health Service when the patentees in England refused to supply them at reasonable prices. The case went up to the House of Lords and the House of Lords decided that Government were perfectly justified in importing those drugs in order that the Health Service needs may be met. A thing similar to what you have mentioned occurred in England also.

Mr. Chairman: What is good for England must be good for India also.

Mr. Haslam: Yes, Sir; but you already have clauses in this Bill dealing with the right of Government to use an invention for the Services of the Government, what are called in the United Kingdom, the Services of the Crown, which was the matter which the hon. Member has just referred to. These clauses already exist elsewhere in the Bill. The objection to this particular sub-clause, 95(3), is merely that it puts into reverse, as it were, the object of the previous clauses, clauses 84 and 85, to encourage the development and production of drugs in India.

Mr. Chairman: How will it put it into reverse? This company, Messrs. May and Baker, refused to supply.

Shri R. P. Sinha: Even if there is an established industry in any country, just like in the UK, the Government thought it appropriate and proper in the public interest to import despite the fact that they were being manufactured in England. So, there may be some occasions here when, in order to bring pressure upon the patent holders here to supply goods not only in adequate quantities but also at reasonable prices, the Government may exercise that power as the Government in the UK very recently did.

Mr. Haslam: In clause 100 you already have the power of the Central Government to use inventions for the purposes of Government. This clause in the Bill corresponds to the section in the UK Act under which the UK Government imported tetracycline for, what we call in the U.K., Crown use, and here Government use.

Shri Bade: That is for invention; clause 95 is for importation of medicines from outside.

Mr. Haslam: You use here exactly the same words as are there in the UK Act, namely, that the Government "may make, use, exercise or vend the invention for the purposes of Government in accordance with the provisions of this Chapter". I see no reason why that does not allow the Government to import if they want to. I think, we are arguing about the point where such a clause giving the right of Government to import should go in the Bill. Our feeling is that it should not go in the clause which deals with compulsory licences for the purpose of promoting industry in India but should be considered in the whole context of the use by the Government which occurs in later clauses, that is, clauses 99 to 102.

Shri Bade: I would like to invite the attention of the witness to clause 87. A difference is made in the Bill between patents for chemical substances and patents for medicines, drugs and pharmaceuticals.

In clause 95, clause 84 is also referred to. Clause 84 is again referred to in clause 90, which sets

down when reasonable requirements of the public are deemed not to have been satisfied. Only then will clauses 87 and 84 apply regarding the grant of compulsory licences.

Suppose a foreign firm is not manufacturing the item in India, and is not also giving the know-how to India, and at the same time, they have a patent from India and they have also a monopoly; suppose Government come to the conclusion that this firm is not manufacturing to an adequate extent but by creating a monopoly is exploiting the poor people; in such a case, why should clause 87 not be made applicable?

Mr. Haslam: Clause 87 applies automatically. Under this Bill, all patents in the chemical field are endorsed with the words 'licences of right'.

Shri Bade: I am talking of clause 84.

Mr. Haslam: If this Bill is passed in its present form, there will never be any need to apply clause 84 in a chemical or pharmaceutical case, because all those patents would be endorsed with the words 'licences of right' anywhere, so that it does not really arise.

Shri Bade: You have only objected to clause 88, but you have not said anything on the question of royalty where a maximum of 4 per cent only has been prescribed. What have you to say on the question of royalty?

Mr. Haslam: We do think that the royalty limit of 4 per cent is unrealistic.

Shri Bade: What is the reason for it?

Mr. Haslam: This is an economic question. May I ask my colleague Mr. Nowotny to deal with this question?

Mr. D. H. Nowotny: The reason why we have to ask for a higher price for an active substance that we send from Switzerland, than an Italian imitator, is that we have to cover our research and development costs. As you know, our research and development costs are running around 8 to 10 per cent of the whole turnover, and if we put the research and development costs into relation to the turnover of the patented products only it may be much higher.

Shri Bade: Clause 88(5) reads thus:

> "....the royalty and other remuneration reserved to the patentee under a licence granted to any person after such commencement shall in no case exceed four per cent of the net ex-factory sale price in bulk of the patented article.....".

Mr. D. H. Nowotny: As I have said, our research and development costs run around 8 to 10 per cent of total sales; the question is whether these costs are applied to the selling price of the final pharmaceutical speciality or the bulk price of the active substance. The latter is only a small part of the final selling price. Let us say research and development costs are 10 per cent of the final selling price of a speciality. If they should be expressed as a percentage of the bulk selling price, the percentage would be much higher; it can be 30 or 40 per cent or even more. I can give you an example, if that is necessary.

Shri Bade: He may send that to us in writing.

Mr. Chairman: You may give us a note.

Mr. D. H. Nowotny: Yes, I shall do so.

Shri R. P. Sinha: Witness has stated himself that clause 100 of the present Bill is based on an equivalent section in the UK Act, namely section 46, and it is more or less worded on the same lines. Since the provision in the

UK Act was not very clear, a litigation arose in the House of Lords when Government started importing it. To safeguard against such litigation in India, we have tried to clarify the position in clause 95(3) by providing that Government could import also, because in the UK case the point at issue was that the Government could use the patent but not import. What I am stating is this. There, the law has been settled by a judicial pronouncement. We do not want another judicial pronouncement in this country to settle the law. Therefore the legislature here is taking a precautionary measure by having Clause 95(3). What objection have you got to that?

Mr. R. A. Willens: Section 100 can be omitted, but the real point, as I mentioned originally, is that section 95(3) does give a permission to the licencee which is denied to the patentee. If this clause is meant to deal with such emergencies as plague, infection, calamity and that sort of thing, it does seem to me to be inconsistent not to use any means available to import the materials required whether by the licencee or by the patentee. What I am suggesting is that it will remove an injustice if not only the licencee but also the patentee is given freedom by the Government to import.

I should add a further detail, that this will not only apply to compulsory licences under section 84 and 85 but also to licences of right under section 87, and under section 88(6), which is subject to the conditions of licences provided in section 87, licences of right are applicable not only to pharmaceutical material and foodstuffs but also to chemical products absolutely without exception. That is to say, it covers the entire chemical industry, which is of course our particular concern. Section 88(6) reads:

> "Save as otherwise provided in sub-section (5), the provisions of sub-sections (1), (2), (4), (5) and (6) of section 93 (regarding the powers of the Controller) and of sections 94 and 95 shall apply to licences granted under this section as they apply to licences granted under section 84."

So, you see section 95 refers to section 84, and section 88 makes it clear that it refers also to section 87. This is our legitimate comment on the meaning of the Bill, and this will answer the proposition that section 95(3) is a good alternative to section 100.

Mr. Chairman: Please see section 47(1), which is only subject to clause (2). He can import, he can sell; but suppose he does not import in sufficient quantities at reasonable prices, what is Government to do? Then comes section 100. It is only the Central Government which can exercise that right, not the Controller.

Shri R. P. Sinha: The witnesses represent the entire industrial and chemical community of the European countries. Countries like U.K. have got provision for licences of right. I would like to know how far this clause is used for giving licences to other than patent-holders for the manufacture of the patented articles.

Mr. R. A. Willens: As regards the U.K., I should first make the observation, to avoid misunderstanding, that the licence of right in the U.K. is something different from what is contemplated in this Bill. It is a voluntary concession on the part of the patentee. He requests the Controller to endorse the patent for licence of rights and thereby he gains himself advantages, namely reduction in the renewal fees payable.

Shri R. P. Sinha: In the U.K. Act, there is also a provision for compulsory endorsement of licence of rights. It is not only voluntary under section 37.

Mr. R. A. Willens: That is quite true.

Shri R. P. Sinha: What use has this section been put to?

Mr. R. A. Willens: These are the same grounds as those specified in section 37 of the Act, and merely extend to the government departments the right to initiate proceedings which are indeed available to anybody else under section 37. So, it is the same thing. But it is different from the provisions of the right in the case of clause 87 of the Bill which is automatically given irrespective of any request on the part of anybody, whether it is a government department or a licensee.

The answer to the other part of Mr. Sinha's question is this. From the report of the Controller-General for Patents, Designs and Trade Marks for the year 1965, it is very clear that very little use is made of this provision. It is not necessary that it should be very much used. The extent of the provision and the possibilities that anyone can go to the Controller and insist on having a licence persuades the people to grant licences more easily. So, in fact, as is stated in the Controller-General's report, the number of compulsory licences under section 37 is very low, taking the figures from 1956 onwards.

Mr. Chairman: It may be rarely used, but dont you think that the presence of this section is a corrective?

Mr. R. A. Willens: Yes.

Mr. Chairman: Similar, should not the provision for compulsory licence which can be granted in respect of any article of food, medicine, etc., be retained? It is in section 41 of the U.K. Act. Why should you object to such a provision in our Act. What is good for the United Kingdom is also good for India in this case. I am referring to the clause on compulsory licence.

Mr. R. A. Willens: One can have no objection to the provision for compulsory licence, in appropriate cases, and many of these cases are appropriate.

Mr. Chairman: The same is found in Switzerland also. A compulsory licence may be granted by the court within three years from the date of registration of patent. It may be revoked also in certain cases.

Mr. R. A. Willens: It is very normal.

Mr. Chairman: Then, why do you object to the provisions in India?

Mr. R. A. Willens: Section 87 goes far beyond anything in the provision of any United Kingdom Act, because it is quite automatic, and it does not require any application on anybody's part. It is purely automatic and comes within the subject of invention.

Shri R. P. Sinha: May I take it that you do not object to the licence of rights as such when this is being endorsed by the Controller or from the Government in the case of a patent. What you object to is the automatic endorsement of all the patent licences as described in section 37.

Mr. R. A. Willens: That is quite right.

Shri R. P. Sinha: What is the experience in Switzerland and other European countries? What is the amount of profitability in the patented drugs or goods or chemicals. By how much is the selling price of patented products higher than the cost of production? We are told that some of the patented products in India sell at 400 per cent more than the cost of production. What is the average? Could you give us some idea of the general profitability in respect of the patent products in the European markets?

Mr. J. Egli: May I ask Mr. Nowotny to answer this specific question? But before he answers. I would say that in regard to the compulsory licence system which was referred to by the

Chairman, while I am not a specialist in patents, I may point out that for years and years, maybe 10 to 15 years, there are no compulsory licences given by the Swiss authority because nobody asks for them. We have not problem in this field.

Mr. D. H. Nowotny: I would like to answer the question that the hon. Member has put. I do not think that we are in the position to give a general rule, at how many times a patented drug sells for based on its production cost. I do not think that any company in the whole industry can give such a figure; I do not think a figure like that exists. As I told you before in the pharmaceutical industry, we depend mainly on the medically and commercially successful products or drugs. Under the patented products, you will find a series of pharmaceuticals that are merely medically useful. Therefore, the selling price of such a pharmaceutical products could be fairly close to its main production costs. That means if you are adding the research and development costs and medical information expenses, and general management and administrative overheads, you may find yourself making a loss on this specific products. On the other hand, you will have a few commercially and medically successful drugs and these commercially successful drugs are the main contributors to the common pool out of which research and development is being financed. It is difficult for us to give an average, but all I think we can say is this: in the experience of the pharmaceutical industry of the world, and I must refer to American figures, we know that the very well-managed international companies usually make a profit of 10 to 20 per cent on sales. So, I think this might be an indication of what is left after you have not only provided for production costs but after you have covered the research and development costs as well and all the medical information and administrative costs and after you have paid the taxes.

Shri R. P. Sinha: What percentage of profit after paying taxes will attract a suitable market for exploitation?

Mr. D. H. Nowotny: This is a very pertinent question. In an industry like the pharmaceutical industry, which is under pressure to look for new products, party to replace the older ones, probably 10 to 20 per cent profit after taxes would be regarded as sufficient. There is an interesting study made by a French management consultant recently which has been published in a book in French—["Morale de l'entreprise et desfin de la nation"] the title can be roughly translated into English as "The Ethics of Business and the Fate of the Nation". Enterprises are divided in this book into three groups. The first group of companies makes a profit of 7 to 10 on their capital invested; they do not innovate very much. The second group makes 10 to 20 per cent profit on capital invested. Into this category fall most of the well-managed companies that account for a lot of innovation like the pharmaceutical industry, automobile and aircraft industry and electronic industry. The third group makes a profit of over 20 per cent. It comprises usually smaller companies who through hard work and maybe some luck also have achieved a scientific break hrough. This is a very temporary affairs and these companies need that high return for reinvestment and consolidation of their position. In the pharmaceutical industry, the costs of research and development are going up every year. If you realise that research costs are going up in a steeper way than sales do, I think 10 to 20 per cent profitability after tax is not exaggerated.

Shri R. P. Sinha: Has this book been published in English?

Mr. D. H. Nowotny: No.

Shri R. P. Sinha: Will you send a copy of this book?

Mr. D. H. Nowotny: I will send the French copy. You can have it translated.

Shri R. P. Sinha: The leader of the delegation has been talking about the inhibiting nature of this Bill in regard to inflow of foreign capital and technology in this country in the field of chemical and pharmaceutical industry. Now you have said that 10 to 20 per cent profitability will be able to attract foreign capital into India. According to the Reserve Bank of India Survey made in 1965, the chemical and pharmaceutical industries in India have been drawing a net profit, after taxes, of about 17 to 12 per cent. Is that not a sufficient incentive for foreign capital to come into India?

Mr. D. H. Nowotny: I have not seen these figures, but we must be very careful when we talk about return on investment as to what we mean by it. Some of the foreign companies which have come to India and invested not only in the pharmaceutical industry but in the basic chemical industries have very large research investments outside India. In England, a calculation was made by the Government about the profitability of American pharmaceutical companies and the astonishing figure of 40 to 50 per cent was mentioned as their profitability. These figures had to be adjusted later on, because it was found that the American subsidiaries in U.K. were largely profiting from the heavy investments of their parent companies in U.S.A.

Dr. C. B. Singh: You talked about the huge expenses on research, etc. Suppose you carry out 1000 experiments. What will be the percentage of the successful pharmaceutical products produced out of those experiments?

Mr. D. H. Nowotny: If you are conducting chemical and medical research on 4,000 to 5,000 chemical substances, you will usually get a commercially viable product only in one case. So, we have to screen 4 000 to 5,000 chemical substances to produce one drug. I would even go further. This one drug that is marketed does not mean that it will be commercially successful. Probably you would have to look at it this way, that if we screen between 40,000 and 50,000 chemical substances, out of these 40,000 to 50,000 substances only ten substances will be marketed and out of these ten substances that will be marketed only one will be a real commercial success. This is the reason why we always emphasise so much the importance that not one product, namely, the most useful or successful one is singled out out of the company's total product line but that all products are taken together as one unit.

Dr. C. B. Singh: Evidence has come before us that in the last 15 years out of the successful patents which have been put in the world market, U.S.A. is the leading country with 355 items to its credit, Switzerland 44, Germany 33, U.K. 28, France 21, Australia 1, Italy 1 and India 1. Could you explain the reason why U.S.A. has 355 and Italy only 1?

Mr. D. H. Nowotny: I do not think we have to go too far to find an explanation for this situation. In the United States, patent protection is very strong. You do not only have process patents but you also have product patents. The U.S.A. have one of the strongest patent protection in the world. In Italy you do not have any patent protection at all. I think there is now a Patent Bill being studied by the Parliament. There is no pharmaceutical company which can really run the risk of employing a large research staff and continue to make research for many years if there is no guarantee that if it achieves success it will have a temporary monopoly on that successful product. We know that one of the basic aims of patent protection is to stimulate the inventor. This is what has been said 500 years ago, if you remember, in the preamble of the Patent Law of the Republic of Venice in 1474, where it was stated quite clearly that patent laws are there to stimulate the inventor. I think patent protection explains why there are such wide differences in the creation of new products.

Dr. C. B. Singh: It has become evident that the distinction between 'process' and 'product' is getting thin and thin. Do you agree with this statement?

Mr. R. A. Willens: I think it is fair to say that in the general case there is no difficulty in having both claims, for process and product, if it is appropriate. The amount of cover afforded by such a patent is really no greater than that of a patent which covers either the product or the process. It has the advantage that the enforcement of protection is a little easier. In some countries it is thought better not to have patents for products. In such cases if the matter is to be protected at all it must be in terms of the process. In such countries, if there be a new product, the onus of proof, to prove that it is not produced by the patented process but by some other process, is placed on the man who has the product and not on the patentee.

Dr. C. B. Singh: Do you think it will be advantageous if in the new Bill that is before us provision is made to give patent protection for products, along with the process as well?

Mr. Haslam: I think that would be of great advantage. I think the weakness of process cover in many cases where new substances are discovered having valuable properties, is that with modern chemistry at the high level that it is today, it is possible to think of many ways, sometimes as much as a dozen ways in which a substance can be made. If patent cover is only to the process it wastes a lot of time for the inventor to have to patent all the feasible ways of making the substance. The real invention lies in the discovery of its properties rather than in the process by which it is made. Once you give the information that such and such substance is valuable for a certain purpose, a competent chemist could find many ways of making that substance. It is merely to cover these which are well-known to chemistry that patents are taken.

Shri Kashi Ram Gupta: In the last paragraph of your memorandum it is stated:

> "Should the Bill in its present form pass into law, European chemical companies will be forced to re-assess their plans for investment in India and may also have to consider seriously the implications for the sale of licensed know-how."

How does the Patent Bill affect the licensed know-how?

Mr. R. A. Willens: The common practice in licensing a patent is that not only should the licensee be given proper leave to carry out the process or produce the product, as the case may be, but he should have the benefit of patentee's detailed experience. This is the know-how that companies obtain. In the case of unenforced licensing agreement the patent is licensed and the know-how is transmitted freely and it is generally on extremely friendly terms. The patent has a great advantage that it thus serves as a bar to anybody else using that extremely valuable know-how that has been transmitted along with it. This is the way it normally goes in the licensing field. If the know-how is not required on the one hand, or if the licensor is not willing to transmit it on the other hand, you have a bare licence. It is mere permission to infringe the patent without any know-how being transmitted. This can arise in two ways. The way we are concerned with at present is where a licence is compelled, either by the action of the Controller, or the Government, or the operation of section 87 of the law providing for a licence of right. The licence can be compelled but no one can be compelled for transmission of know-how which is essential for manufacture. A bare licence is also commonly used where the company is well versed in that field and wants to simplify some of the operations. Generally, the subject matter is not of interest to the patentee and what the licensee wants is mere

permission to ignore the patent and, if the licensor has no objection, he allows him to do that for a small consideration. Then that licen e is granted which is a simple matter.

Shri Kashi Ram Gupta: Know-how is not necessarily connected with the patent Bill.

Mr. R. A. Willens: It is perfectly true that know-how is not connected with the Bill. However, in practice it is generally the case that one is dealing with a variety of processes, not just one simple thing; more than one patent would be involved and a body of know-how would be involved and it would be quite impossible to disentangle one from the other. Some of the know-how would be intimately connected with one of the patents, perhaps more than one and some of them undoubtedly not; but some it will be impossible to say whether they are connected with the patent or not.

Shri Kashi Ram Gupta: You have mentioned many European countries in your memorandum. Are the patent laws of those countries identical with respect to period, licence of right and compulsory licence?

Mr. R. A. Willens: I think in general the laws of most of the countries are uniform. I am afraid I cannot really answer in detail on this question. They are uniform and I would be surprised to find otherwise. The laws of all countries provide for the imposition of compulsory licence in the event of non-use provided, of course, that under the terms of the international convention there is suitable lapse of time to give the patentee a chance to carry out his invention and provided also there is a reasonable return to the patentee for his invention, whether he has been able to use it or not.

Mr. Chairman: You have provided three years.

Mr. R. A. Willens: Yes. It is a standard period imposed by the Paris Convention.

Shri Kashi Ram Gupta: Are the European countries exporting countries or importing countries in this field?

Mr. R. A. Willens: I think we are both exporting and importing countries.

Mr. J. Egli: I think I can answer that question. Germany, Great Britain, Switzerland and even France are producing pharmaceuticals and I think all these countries have a rather high export market. But they have also a very strong import because normally no trade barriers exist. But if you take the Scandinavian countries and other smaller countries where the pharmaceutical industry is not so highly developed and is not so large, I think the imports are higher than the exports.

Shri Kashi Ram Gupta: So far as the developing countries are concerned, I think their laws must be substantially different from the laws of the countries which are highly developed. If you compare our patent law with the laws prevailing in the developing countries, do you find any difference?

Mr. Haslam: As I understand it, what is in the questioner's mind is as to what extent patents play a part in developing a country.

Shri Kashi Ram Gupta: The point is that the difference in patent laws in regard to certain points might suit developing countries and, therefore, they may differ from those of the developed countries. Secondly, have you compared the laws of the various developed countries with our own laws?

Mr. Haslam: As far as I know, the laws of almost all countries in the world are more or less the same in this respect, that is, about the use of inventions and the penalties imposed upon not working an invention in the country concerned. I can say quite categorically that there is no country in the world that has provisions any-

where parallel to the provisions provided for in the Indian Patent Bill. They do vary slightly from the one to the other. As you know, in the UK drugs are treated differently from other substances But we make no difference between chemicals and any other type of invention. In some countries, which have not acceded to the Paris Union, failure to work a patent does result in the forfeiture of the patent right. This is the most extreme penalty. But no country imposes a licence of right system on any class of patents right from the moment the patent is obtained.

The thesis that my organisation is trying to put forward here is to explain how the patent laws of your country have provided only limited protection and how this acts as a disincentive to bringing know-how into the country.

If I might refer to the question that the hon. Member asked earlier on, I could put an imaginary situation. Suppose, I am a patentee in UK and I want to exploit my invention in India and in Switzerland. I want to do this by granting licences. Behind this invention there is a good deal of know-how which must be passed on before it can really be put into proper and efficient commercial production.

Now, let us assume that this Bill is passed in its present form. Then, may I compare the two situations that I would be faced with in the two countries? In Switzerland, I would know that anybody with whom I have made an arrangement would have the exclusive licence, that he would not be subject to competition, that he would be willing to pay me reasonable royalty, that any know-how that I pass on to him would be confined to him solely, that I would have rights against anybody else who took it from him and that he would have rights also and we would be able to enter into a friendly, carefully worked out arrangement which will be economically and technically satisfying to both parties. On the other hand, if I wish to do such an operation in India, I would have many difficulties.

Shri Kashi Ram Gupta: Under the present law? Not under the present Bill?

Mr. Haslam: Under the present law the situation is equally satisfactory because I can enforce the patent and I can make a good arrangement; but if the Bill were passed in its present form, I would know that anybody can come along for a licence and, therefore, I cannot give my intended partner any sort of exclusive rights. Therefore, I would have no knowledge that this know-how that I wish to pass on would be exclusive and would bring me a return. I would be simply throwing it into an almost open sea. I will not say that I will not do it. Also, I will not say that the flow of technology would stop; but, what it would mean would be that I would be in a much less secure and a much more doubtful position and if there was a situation of my wanting to develop this invention in the Far East and I had to choose between India and Japan, with India having the Bill as suggested here; I would probably say that I would prefer to exploit this invention in the Far East in Japan where there are more secure patent laws. It will be all the time a drag and representing a disincentive to enter into arrangements in India.

Shri Kashi Ram Gupta: Formerly, the practice was that the period of the patent was counted from the date of application but some countries preferred that it should be from the date of grant of the patent. Are you also in favour that the period should be counted from the date of grant of patent rather than from the date of application?

Mr. Chairman: What is the position in England?

Mr. Haslam: In England it is 16 years from the date of filing the complete specifications.

Mr. Chairman: We have put in 14 years from the date of application for things other than drugs.

Mr. Haslam: The two countries which go by the date of grant are the US and Canada; most of them go by the date of application.

Mr. Chairman: What time do you take to grant a patent in England normaly from the date of filing the application?

Mr. Haslam: The maximum time that is allowed to the Patent Office is now three years from the date of filing the complete specifications. From the date of filing the appiication it is about four years.

Mr. Chairman: What percentage of profits do you invest in research in England?

Mr. J. Egli: I have no figures of what is invested in research work in Great Britain.

Mr. Chairman: Can you get it for us?

Mr. Haslam: I think, we could find it for you.

Mr. Chairman: In your Act also you have got restrictions on the manufacture of foods and medicines and for the grant of compulsory licences. Have those provisions in any way affected your own industrial development?

Mr. Haslam: I do not think they have exactly affected the growth of industry. One could not say that they have stultified it. But as they are used more and more, they act as one of the disadvantages of putting money into research. They have not gone to the extent where one would say that it is not worthwhile investing in research because of these provisions. That would be going too far. But I think a good deal of feeling is aroused against the people who make use of these provisions, in that they are people who, we feel, are taking advantage of all the effort and research that is being done and are simply cashing in on the efforts that other people have made to develop the new products.

Mr. Chairman: Thank you very much, gentlemen.

Mr. J. Egli: Mr Chairman, may I just once more thank you very, very much for the kindness that you have shown us on this occasion.

(The witnesses then withdrew.)

(The Committee then adjourned.)

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965.

Tuesday, the 5th July, 1966 *at* 09.30 *hours*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Seth Achal Singh.
3. Shri Peter Alvares.
4. Shri Ramchandra Vithal Bade.
5. Shri Panna Lal Barupal.
6. Shri Dinen Bhattacharya.
7. Sardar Da'jit Singh.
8. Shri Basanta Kumar Das.
9. Shri V. B. Gandhi.
10. Shri H. K. V. Gowda.
11. Shri Kashi Ram Gupta.
12. Shri Madhavrao Laxmanrao Jadhav.
13. Shri M. R. Masani.
14. Shri Braj Behari Mehrotra.
15. Shri Bibudhendra Mishra.
16. Shri Naval Prabhakar.
17. Shri R. Ramanathan Chettiar.
18. Shri A. T. Sarma.
19. Dr. C. B. Singh.
20. Dr. L. M. Singhvi.
21. Shri P. Venkatasubbaiah.
22. Shri Balkrishna Wasnik.
23. Shri Ram Sewak Yadav.

Rajya Sabha

24. Shri Arjun Arora.
25. Shri Vimalkumar M. Chordia.
26. Shri B. T. Kulkarni.
27. Shri P. K. Kumaran.
28. Shri Shyamnandan Mishra.

29. Shri Dalpat Singh.
30. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMAN

Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. 1. Prof. Gino Bergami, *Director, Institute di Fisiologia Umana Universita (Naples).*

2. Dr. Giorgio Delgiudice, Leodoga SPA Lepetit, *Via* Andrea Vesalio 6, Rome. (Assisted by Mr. Gabriel Brohamasha as Interpreter).

II. Federation of Economic Organizations of Japan, Japan Pharmaceutical Manufacturers' Association and Japan Pharmaceutical, Medical and Dental Supply Exporters' Association, Japan Patent Association, Tokyo.

Spokesmen

1. Mr. Shoichi Inouye, *Senior Managing Director,* (Assisted by Sardar Hem Singh, as Interpreter).
2. Mr. Shoji Matsui, *Patent Attorney.*

---

1. Prof. Gino Bergami, Naples and Dr. Giorgio Delgiudice, Milan (assisted by Mr. Gaibriel Brohamasha as Interpreter.

The witnesses were called and they took their seats

Mr. Chairman: We have received your Memorandum. Your evidence shall be treated as public and is liable to be published unless you specifically desire that all or any part of the evidence tendered by you is to be treated as confidential. Even though you may desire your evidence or any part of it to be treated as confidential, it shall be made available to the Members of Parliament. If you want to stress any particular point or points mentioned in your Memorandum or you want to add something to that, you may do so. Afterwards, the Members of the Committee will ask questions or seek clarifications and you may answer them.

Prof. G. Bergami: Mr. Chairman and Hon. Members of the Joint Committee: My colleagues and I feel honoured to be with you today. We have come of the way from Rome and Naples in Italy to share our thoughts of a subject with which we are familiar and which is of vital importance to developed and developing countries.

Before I introduce my colleagues and myself, I wish to pay you the most hearty compliment for your readiness to hear the views of experts from other countries. As much as I know about the parliaments of many

other countries, your approach may be unique and for excellent reasons. It shows in a very impressive manner how liberal democratic and progressive your par iamentary institutions are. We have nothing but admiration for the manner in which Government and people of India have recently faced the tremendous problems that are before you.

Apart from our general qualifications of competence to speak on the subject under discussion today, I may be permitted to say that in my own person I have some special affection and regards for this great and ancient country. I always wish for your progress and prosperity. I represent no special interest nor any industrial enterprise and my only interest is the welfare of the people of India.

Let me now introduce myself. I am an university professor teaching Physiology in the University of Naples with a medical and biochemical background in the field of Applied Biology, Pharmacology and some personal experience in the field of public health problems and sanitary legislations. It has happened to me to be nominated, immediately after the War, High Commissioner for Public Health in order to reorganise the public health service in Italy destroyed by the War.

I have been for many years the member of the Italian High Council of Public Health, the technical body consulting the Government in sanitary matters and I have particularly studied the problems related to drug production, controls, etc. Last year, I was heard in the Italian Chamber of Deputy as an expert for the problem of drug patentability. In consideration of the fact that I am not an expert in economics and I cannot answer the questions of industrial character and in order to give you the greater possibility to have direct information relating to the Italian situation, I have asked the Italian Association of Pharmaceutical Producers to nominate a delegate to be at your disposal to answer clearly to any variety of questions that are likely to be put to us. Dr. Zerill-Marimo was nominated and he prepared the memorandum that has been sent to you yesterday. He was unable to come to New Delhi because of sudden ailment and his place is taken by Dr. Delgiudice, the economic expert of the Association. I have the great pleasure to introduce him to this hon. Committee and I have great pleasure to introduce also Mr. Galbrid Brohamasha who will be our interpreter and will facilitate our task.

Now, I come to my Memorandum. In the Memorandum that I sent to the hon. Committee, as you certainly remember, I tried to enlighten the Italian situation after a long experience of no-patents on drugs. Let me now explain more in detail the most important points. How was originated the law according to which no patent was granted for the production of drugs? How the Italian drug industry deve'oped and how the Italian drug industry has been affected by this law? Why the Government is willing to change the no-patent policy? Which is the type of the Italian draft Bill and what are its salient features?

Coming to the story of this law, may I say that about one hundred years ago, to be precise, one hundred and sixteen years ago, the Italian Subalpine Parliament, after a long discussion, approved a law excluding the patent protection to pharmaceutical products.

It is interesting to ana'yse as to what motivated this decision to be taken when the pharmaceutical industry was practically non-existent. At that time any kind of medicine was prepared in the pharmacy by pharmacists following the recipe of the physician and the real pre-occupation of the Italian legislator was to avoid that the utilisation of a good recipe, should be inhibited by patents. The main aim of the law was, therefore, to protect the freedom of prescription of the physician, avoiding that a patent previously given to another physician or to a pharmacist should

prevent its use. The same law, for analogous reasons, was at the same time adopted in France and for many many years, in France and Italy, no patent was issued to any pharmaceutical product. But little by little, with increasing industrialisation in the production of drugs, the preparation of drugs shifted from the counter of the druggist to the laboratory of the industry, originating a new situation, characterised by the introduction of what we call "medical speciality", with fancy names, sold in finished form, ready to use.

New regulations were issued, both in France and Italy—because pharmacopoeia was no more sufficient to guarantee the quality of the medicine sold to the pub ic in finished form—dealing with the need for control of efficiency and tolerance of the ingredients of the medical specialities. But to make con'rol efficient, you must know the composition, and for that reason, compulsory declaration on the labels of all the constituents was prescribed. Secret formula was no longer al owed and this originated the problem of the protection of the righ's of the inventor of the new drug in consideration of a very good incentive gi'en to the research in other fie'ds by the patent system. The French legislation was later modified; so they have now a special drug patent for medicines, whereas in Italy a very long legal controversy started, because of some unfortuna'e series of circumstances. After a long discussion on the interpretation of the law of 1859, prohibiting only the product patent but silent about the process patent, in 1934 a 'aw was issued pro'iding in Sec'ion 16 for the patentability of the process patent for drugs. The law provided that it should conform with special regulations to be issued later. Unfortunately, some tec'nical difficulties arose in the drafting of the regulations mainly because of the difficul'y to organize the evaluation of novelty; many years elapsed and the regulations were not issued unti' 1939 when a new decree was issued giving to the Government the power to regulate all the matters. S'rangely enough, the patent decree issued in 1939, in Section 14, in contradiction with S'ction 16 of the previous law, ordered that no patent should be granted for process of drugs originating a legal controversy on the legal validi'y of the law. After many years of discussion, in 1957 the Supreme Constitutional Court confirmed that legally the patentabi ity of drugs also as patentability of process, was still not allowed and invited the Go'ernment to draft a new law. Many drafts were prepared and finally now we have a draft bill, which is at present in the High Chamber of Senator for approval. As I wrote in my Memorandum, we have never had a patent law for drugs and this not as a result of a pre-arranged governmental policy, but as the result of concomitant lega' controversies which have bereaved the efficacy of the 1934 law, never enforced.

So we have had, in Italy, the strange situation of having full patent protection for all the chemical industries with the exception only of the chemical drug industry. We will see later the different resu'ts obtained in these two different branches of the chemical industry.

Having spoken of the story of legislation, let me now examine the development of the Italian drug industry. This examina'ion will be done by me in the light of the non-patent system. Generally speaking, the degree of development of the drug industry may be classified into four stages:

(i) when practically all drugs are imported and local industrial production does not exist;

(ii) when industrial production is limited to the packaging or formulating drugs imported in bu'k and no production of basic drug is operating;

(iii) when a substantial production of basic drug is operating ; and

(iv) when the production capability is increased and there the technical possibility for producing all drugs when economically convenient.

Until the First World War, the Italian drug industry was near stage 3, mainly devoted to the packaging of drugs imported in bulk; the production of basic drug was limited to a few items. With the First War, the disappearance of the German medical specialities stimulated the local production of some important basic drugs. After the First War, the situation changed very little and although no one drug was patented, foreign producers continued to export in Italy their products, while the Italian industry took no major interest in the reproduction of imported drugs. The reason for this lack of interest can be found in the following facts:

(i) No one product was of such a therapeutic importance as to guarantee a large market.

(ii) The expected cost of local production was not competitive due to the sub-critical mass production foreseeable.

The situation was static till the discovery of sulpha drugs—discovery of the greatest therapeutic importance, *i.e.*, after about 1936. This was the first time the Italian industry took advantage of the lack of patent, reproducing the original product and the new derivatives that followed.

But the consumer had no economic profit of the local production because the prices were practically the same as that of the imported products, due to the fact that the originator was not compelled to charge substantial cost of research.

As a matter of fact, the inventor of sulpha drugs patented a complex molecule and was not aware as was demonstrated by other researches, that only a small part of the molecule was active. So it happened that the burden of the cost of research was practically supported only by the firm which originated the first product, while the new-comers obtained patents for new derivatives without too large expenses in research. So apparently the prices of sulpha drugs were not so high and the greater cost of small domestic production practically counterbalanced the cost of the royalty not paid.

The situation changed completely after the Second World War when in twenty years many new drugs of tremendous importance were introduced in the world market. A great number of the new drugs were the result of very heavy investment in research, representing in many cases millions of dollars, and consequently their prices reached a level never realised before.

For the first time in the history of drugs, the structure of the price of the new drugs changed drastically leaving a substantial research cost to be recovered by the originator during the life of the product. Obviously the large margin existing in these cases between the pure production cost and the selling price, induced many small Italian firms to start production in spite of the expected low yield, due to the lack of know-how and the small production, largely counterbalanced by the fact that they have not spent money in research. So it happened that the number of small drug enterprises in Italy increased enormously reaching more than 1000 units, more than in the United States.

This multiplication of drug producers created two different effects.

The first effect was the flooding of the Italian market by a very large number of specialities almost identical. For example, for each new product which appeared on the American, English, French or Swiss market, 10-20 or more products appeared in Italy, almost of the same composition, but all sold under different names.

The second effect has been the availability, in bulk, on the pharma-

ceutical market, of new products elsewhere patented, generally sold at a very low price because the producers have no research cost to charge, and because their profit was mainly based on the sales of the related speciality and the bulk sales being mainly directed to permit a substantial industrial production in order to reduce the general expenses.

In both cases there was no economic advantage at all to the Italian consumer, because, in order to meet the larger promotional expenses, due to the great number of competitors for the same product, prices have been maintained in an order of magnitude of the original product, comprising the research cost, and the low price of the product in bulk has been utilised only for some export business where and when no patent protection was enforced. I have given in my memorandum one specific example to substantiate this.

It is thus clear that as yet, lack of patent protection has not been of any advantage to the Italian consumer because the savings of possible licence payments are counteracted and even exceeded by the larger advertisement costs necessary to establish one's own product in a market among about twenty like products.

In fact as could not otherwise be expected, this excess of competing products, which practically have the same price as the original product and thus do not exert a price-fixing effect, has resulted in an enormous wastage of free samples and increase in advertisement costs. This has made expensive both to launch a new product and to keep the doctor aware of the products already established, in order to prevent replacing them by others almost identical in price and composition.

In conclusion the Italian experience demonstrates that, whereas the lack of patents in the drug field has not had the effect of lower prices for the consumer, in the meantime has been an hindrance for the few important Italian drug manufacturers.

As a matter of fact only small or medium-sized producers have entered the market with copies of patented drugs, starting the production only when from the clinical investigation results published by the original producer, or from the preliminary sales in the country of origin, potential market in Italy was foreseeable, capable of paying the cost of a small-sized production sold at the same price as of the original producer, taking in this way undue advantage of the absence of research cost.

Objectively we must recognize that the lack of patents has had a negative effect on the best part of the Italian pharmaceutical industry, burdened with the increasing cost of research, and obliged to fight with competitors copying freely the best products originated by others.

In conclusion our experience has clearly demonstrated that the lack of drugs patents has badly influenced the development of our best pharmaceutical industry, when compared with the very good results obtained in Italy in other branches of the chemical industry protected by product and process patents. If we look at the good achievements of the Italian chemists in other fields, we have very excellent results and a large number of patents. The only exception of the pharmaceutical industry.

It will be convenient to examine at this point the future trend in the pharmaceutical industry. As you certainly know, a tremendous amount of money is yearly invested in drug research in all the industrialised countries. This heavy investment, increasing every year, is required because the pharmaceutical research is completely different from all other types of industrial research. If for instance we consider an automobile factory, the management can easily make a

research programme for a new type of engine. The technicians will do their best; the result may be more or less successful, but in any case the research department will be able to give the management a new engine. In the case of the drug industry the picture is completely different. The management may ask the research department to find a new remedy for hypertension, but nobody can assure that a positive result will be achieved. We can give any quantity of money; we can enlarge the laboratory, asking for a remedy for cancer, but nobody can forecast the results. What we know is that on an average only one product out of 3000 or 4000 new products shows promising activity as a new drug and when we say promising activity we say that we have in hand not a product but only a probability of success.

And now we can forecast that in the next decade, very few new products will enter the market at a tremendous cost of chemical, biological and clinical investigation. This means that new products will certainly be charged of substantial amount of cost of research, that should be paid by the State or by the industry.

We must therefore make our choice State research or private research. I must recognise that I am not fully confident in the efficiency of State research in the pharmaceutical field. My opinion is absolutely not based on political reasons, but on the observation of the very important results obtained during the last 20 years by the Soviet Union in all fields with the only exception in the field of drugs. I have the best consideration for the high scientific standing of my Russian colleagues in all fields and I know also that the drug research is very active. Therefore, the explanation should be found in the peculiarity of the new drug research, requiring the largest possible freedom individual freedom, of research. Let me give you one example. It happened many years ago that an American company—I remember it is the Lilly Company—received from a tropical country a flower plant called Vinca Rosea, which was locally used for treatment of diabetes. They tried to extract the active principle of the plant, but they found that there was no effect at all on the blood glucose or on diabetes. In the meantime, one researcher found that after the injection of the drug into a rabbit, the leucocite (white blood cells) diminished. So it was discovered that the drug had the effect of reducing the number of leucocites (white blood cells) and was later utilised for treatment of Hodgkins disease or leukemia. This result of research was due to a very large amount of freedom. This is why State research is not good because this kind of freedom is not there. It may reduce the number of new inventions. So we should give a large amount of freedom in research.

Personally, I am in favour of the co-existence of a State research, mainly basic research, with a private research, mainly applied, stimulated by an efficient patent system. Our experience in Italy has demonstrated to us that the problem of prices of drug is practically independent from the problem of patent. Prices to the public in Italy are of the same order of prices in countries having the patent—like France, England and Switzerland—and, what is more impressive, the prices of the biggest Italian producers who pay voluntary royalties to the foreign inventors are the same as the smaller producers who pay nothing at all. We have also noticed that multiplication of producers in the drug market increases the price because of the higher cost of promotion and the low yield of the small production unit, inferior to the critical production mass peculiar to each product. For all these reasons, Italy is now changing its drug patent policy.

It may be of some interest to you to note the fact that the Italian Government is preparing a five-year economic development plan and recognising the importance of the re-

search in the sanitary field, has clearly indicated in section 6 of the official plan that the pharmaceutical research will be mainly stimulated adopting the patent protection for the production of drugs. A Bill, introducing the process patent, has already been approved by the Government and it is now in discussion at the High Italian Chamber, the Senate. Many members have suggested amendments in favour of a more effective protection of the invention, as is obtained with the product. patent.

The salient features of the Bill are: patents are to be granted to protect processes for the production of pharmaceuticals; when a compulsory licence is granted, the compensation must be fair and in keeping with the importance of the invention and the profit it is expected to yield, with the duration of the licence and all other aspects connected with its utilisation; and section 10 provides that a patentee "who refuses to accept the compensation as laid down may start proceedings before the court in Rome".

Coming to the Indian situation, I must first of all, heartily congratulate you on the results already achieved. In less than 20 years, your drug industry, operated by the State or by private enterprises, has certainly reached stage 3 and now is in the fringe of stage 4, that means the highest stage. Having in mind the high standing of Indian researchers, chemists, biologists and physicians, there is no doubt that concentrating your efforts mainly in the applied research and specially in the research of new processes for making drugs, you will acquire an increasing purchasing power through crossed licences with all the world. Your researches must be protected as the researches of all the world are protected.

Coming to the practical aspect of the problem, my opinion as an expert is in favour of the possibility of a new type of, may I say, combined patent i.e. a product patent associated with one or more process patents, but with the provision that the inventor of a new process may have a licence from holder of the product patent In such a way the system is very simple to assess and stimulus is given to new processes.

Mr. Chairman and Hon'ble Members, I am at the end of my exposition, and I must apologise for my bad English and for the length of my speech. I hope that my efforts to give you some technical data will be useful for you. In my experience as a Chief of the Italian Public Health in a difficult period, I learnt that laws relating to public health have always two sides, a political side and a technical side. A law drafted mainly by politicians will be a bad law, but worse will be the law drafted only by technicians. I repeat my appreciation for your unique approach to such a vital problem, hearing the views of experts of all the countries. I wish the best future for India's progress and prosperity, and please accept my hearty thanks.

Dr. L. M. Singhvi: Professor, I would like you to dilate particularly on the situation in respect of the quality control of drugs manufactured in your country without patent protection. Is it a fact that the quality of drugs is not uniformly guaranteed? It has been mentioned in some of the Memoranda before us that because there is the freedom of imitation, there is also freedom to manufacture sub-standard drugs. Is it a fact?

Prof. G. Bergami: The standard regulations on the manufacture of drugs stipulate that before you make a drug, you must have an authorisation to be operative in the field of drugs. In other words, you are inspected by an Inspector, who looks at your machinery etc. Naturally, after this authorisation the burden of responsibility lies on the producer. When it is sold in bulk, there is practically no control, because the control is limited to the processed product.

Dr. L. M. Singhvi: Would you p'ease tell us whether during the period when patent protection was not available in Italy, it is a fact that there was no effort by the State also to control the prices? Whether any such effort was made or whether there was no such effort?

Prof. G. Bergami: In Italy, from the very beginning until now there has never been a patent law for drugs. All has been free. But control on quality and control on price of specialities has been operating from many many years.

Dr. L. M. Singhvi: It has been pointed out in the Memorandum submitted to us that the consumer has not gained even though there was freedom to copy any patents abroad. Now why was it so? Was it because the State did not operate effectively to control the prices or it was because the promotional cost inherent in the situation of the high proportion of cost, prevented the manufacturers in Italy to sell these drugs at a reasonable price with only a reasonable margin of profit?

Prof. G. Bergami: If I have understood you well, you ask why in Italy when a copied product is put on the market, it has a price that is not low. Is that right? The price of the bulk is free price. There is no control of the State. There is the general law of economics, the law of the demand. But when you sel' to the public a medical speciality, the price of final product of what is called registration, is based on analysed price. In other words, you must submit to the Health authorities, to the Economic Board, a memorandum where you say I have put so many Liras for the raw materials, so many for that and that, and the fotal cost is that. It happens for instance that one foreign firm has created a new product and is asking for registration in Italy; he will show the clinical investigation results etc. and fina'ly the production cost of the product. He will document the price, say that he can sell at this price. A new comer is not obliged to that, he may just have the same price although is paying anything. He will write to the Ministry saying I am also producing the same product, and will ask for the same price. Govt. has not the possibility to say you may sell at a lower price. The producer will say, I have the same right, I ask for the same price, because it is the same product, and practica ly happens that the copier makes a large profit, but also this profit is not so large, because there are so many. One will do, the other will do the same. In a short time, there will be 20 others. The market is always the same, but the market in this case is divided by 20. Each one may promote it to the physicians. In Italy we have 70 thousands physicians. You can imagine how costly it is to give samples to these physicians. Multiply it by 20 and you can see how much money is spent, with no use, and the cost is natural'y higher. In the drug field, it is always better to concentrate production, to concentrate sales and promotion, otherwise you will have higher cost. Concentrate it at one place, the yield will be better.

Mr. Chairman: Does the competition tend to lower the prices?

Prof. G. Bergami: You must realise that in the pharmaceu ical field the market is different. There is no relationship between the consumer and the producer. There is the intermediary, the physician. So really it is not the consumer that selects the product. The consumer goes to the physician; then it is the physician that selects. So happens, that if you sell a product at a lower price, you can spend less on advertisement and promotion. The public do not know whether the prices are lower, because the producer has spent practically less on the mechanism of promotion.

Dr. L. M. Singhvi: What is the place occupied by the foreign industry in the pharmaceutical industry in Italy? Whether there has been a

substantial inflow of foreign capital in Italy in this particular field?

Prof. G. Bergami: Well I beg your pardon, I am not an economic expert. Mr. Delgiudice will answer for me.

Mr. Chairman: He can answer.

Dr. G. Delgiudice: The only data we can give now....

Dr. L. M. Singhvi: You may supply it at a later date if it is not readily available with you because that will be more precise.

Shri R. P. Sinha: Broadly they can say now.

Shri R. Ramanathan Chettiar: The question is whether there is foreign investment in pharmaceutical industry in your country?

Dr. G. Delgiudice: There is foreign investment in the pharmaceutical industry. But this data we do not have. The only data we have now is that 21 per cent of the foreign investment in Italy is in the pharmaceutical industry. The exact figures of foreign investment in the pharmaceutical field will be supplied later.

Dr. L. M. Singhvi: We will appreciate if you will do that at a later date.

There is one more question, that is, about the new legislation of the 1st of July 1965 which has been drafted by various parties which are participating in the coalition Government of Italy. Would you tell us about the salutary features of this new legislation which was submitted on the 1st of July 1965 to the Senate of Italy?

Mr. Chairman: Can you send a copy of that Bill to us?

Prof. G. Bergami: I can give you the copy.

Mr. Chairman: Is it summary?

Prof. G. Bergami: It is English translation of the Law as drafted.

Dr. L. M. Singhvi: Would you commit on any aspect of this new legislation. You have said this concept has come out of years of thinking. I want to know what are those special provisions which are sought to be incorporated in this new legislation which you think would be particularly conducive to a proper growth and development of pharmaceutical industry in Italy and which has been lacking in the past or in the absence of patent or weak patent laws in your country.

Mr. Chairman: We will get it cyclostyled and distribute.

Dr. L. M. Singhvi: He is giving only the piece of legislation and I want the comments on the legislation.

Mr. Chairman: You please hand it over to us. I hope you have got no objection.

I am told that this Bill is before your Parliament for the last 10 years or 7 years. When do you propose to finalise it?

Prof. G. Bergami: I will explain the situation. We have had during the last ten years many different bills prepared by different Governments. Each time we took it up there was the difficulty of availability of time and in the meantime the Government fell and new Government came, and this happened many times and this is the last one and we hope the life of the Government will be so long that it will be passed. May I also say, that when we draft a Bill we draft it up roughly and there are many amendments during the discussions and it is difficult for me to formulate some comments on a draft which is a starting point. It has just started last week and they started feeling that certain point may be more profitable or not. A committee of Senators has been set up that will discuss it point by point making modifications. After

that the Law must go to the other Chamber and if it is not fully approved it must go back. I believe if everything goes right we will have this law next year, but my comments at this moment, at the starting point as it is, will not serve any purpose.

Shri Kashi Ram Gupta: I think there is a Patent law in Italy for cars, machinery, boilers and other products. Is there any such law there?

Prof. G. Bergami: Yes.

Shri Kashi Ram Gupta: What is the period of a patent allowed in that law?

Dr. G. Delgiudice: The normal period of a patent as in Germany, is about 15 years.

Shri Kashi Ram Gupta: From the date of application?

Dr. G. Delgiudice: Yes, from the date of application.

Shri Kashi Ram Gupta: You have got an agreement with U.S.S.R. regarding FIAT cars. Is it on the basis of royalty or sale of the know how there?

Prof. G. Bergami: Really the automobile industry is beyond my competence. I cannot comment, I am sorry.

Shri Kashi Ram Gupta: Do Italian firms and companies possess patents for drugs also in foreign countries?

Prof. G. Bergami: Yes, there are many cases in which an Italian manufacturer has got some patents in other countries.

Shri Kashi Ram Gupta: Which are the main countries where these patents have been approved?

Prof. G. Bergami: England, France, Belgium, South Africa, South America, North America, Trinidad and Germany etc.

Dr. C. B. Singh: You have got the unique experience of being a physiologist and a pharmaceolcgist, and Public Health man as well. All these things put together, may I know from your experience what time does a drug take after being investigated in the laboratories to be brought into the market? I mean the average time and an average drug.

Prof. G. Bergami: My experience is that it depends mainly on the type of drug that you are experimenting. If you are dealing with a completely new entity, you must at least spend two years.

Dr. C. B. Singh: You think two years will be a reasonable period.

Prof. G. Bergami: It is an average period.

Dr. C. B. Singh: May I know what amount of money is being spent on research by your various firms of drugs or research in proportion to the total investment in this industry?

Prof. G. Bergami: I have no knowledge of that, because I know only about Public Health problems. He, Dr. Delgiudice knows the pharmaceutical industry.

Dr. C. B. Singh: Well, then, let us know about the pharmaceutical industry.

Dr. G. Delgiudice: 3 per cent on the turnover.

Dr. C. B. Singh: A big amount. I want to know whether it has been able to export large amounts of raw materials cheaply to this country because they were not patented in Italy. The question is, because there is no patent for pharmaceutical drugs in Italy, was it possible for those firms to complete more favourably with the world market and export those raw materials cheaply to this country.

Dr. G. Delgiudice: No. We Assofarma, do not do so.

Dr. C. B. Singh: Are you sure about it?

Dr. G. Delgiudice: Yes.

Shri P. Venkatasubbaiah: In the absence of a patent law in Italy, and also because of the foreign capitalists taking advantage and flooding the Italian market in respect of the pharmaceutical products, and also owing to the lack of research possibilities of knowing the quality of each product that is being sent to your country, may I know whether the Government is contemplating any research or control so as to check any spurious drugs coming to your country and to have control over the quality?

Prof. G. Bergami: If, you speak of speciality, there is a strict control at the moment of approval, and also during the stage of sale, because some samples are taken from the market for a severe composition analysing, and the product which is not well made is put out of the market. When we are speaking of the raw material, I was saying that there was no control on that, because we do not need control on the raw material, since we control the finished product. From the point of view of the consumer, what is more important is the finished product. There is a very strict control of quality in respect of the finished product in Italy.

Shri P. K. Kumaran: In your memorandum you have quoted the example where a particular tranquilliser has been produced with 18 imitations, and you have drawn the conclusion that in spite of several imitations produced in Italy, it did not enable the Italian consumer to get the drug at a cheaper rate. When the British Government started the National Health Service, they found that the drugs which they wanted were so costly in the indigenous market, that they decided to import certain drugs from Italy and they got it at a cheaper rate with the result that they later were able to force their medical local manufacturers, to come to some sort of voluntary price regulation scheme. That is the Italian consumer did not get the benefit of the price reduction due to the absence of the patent law, but the British consumer benefited.

Prof. G. Bergami: This is the key problem of this problem of patents. We must recognise one simple fact: when I write a book, I will have the right to have a percentage of the fixed a price for such copy of that book. If somebody will reprint that book without paying me the copy right, he will have a lower cost and may sell it at a lower price. The same happens for the drugs. If some body reproduce a drug, he can sell it at a lower price. But in the case of Italy, if one enterprise has been able to copy, and sometimes they took the knowhow by not so clear channels, he gains selling the specialities at high prices, and then used the bulk sales at any price, for lowering the general expenses. So, they make the best profit on the finished product which they sell at a high price like the original inventor. In England, I do not know whether they have been successful or not with this method. But I believe that all cases like that will not be repeated easily in future, especially in regards to many important drugs such as chloroamphenicol and other antibiotics whose patent are expiring. We must be careful in planning for the future. We need the best new drugs at the lower cost, because it will be always useful if we facilitate that. In the new discoveries that are made, if we do not have the right price, or if we do not protect the price, of research it is not possible to make headway. We must see that the spirit of research is maintained and honoured.

Shri A. T. Sarma: I want to know whether you consider that this Bill, if enacted, will be an improvement and would improve the research and development of industrial activity in India.

Prof. G. Bergami: If I may be frank with you, I must say that especially on the provision of licence of rights, the patent will annihilated on this will be against the interests of discovery. When one patent is availab'e to everybody, nobody starts because he is afraid of the others. Not because of lack of interest, I do not believe that. Frankly, I do not believe your Patent Bill relating to the pharmaceutical industry will enhance research. You have reached a very high standard in research and you have a very large capability; I do not see why you should not act like other countries that have already developed.

Mr. Chairman: Do you know that the patent law in almost every country has got this licence of rights. Out of 74 countries, 60 have got it.

Prof. G. Bergami: I am not an expert on this legal matter.

Shri Dalpat Singh: You have said in your statement that absence of patent does not make any difference, does not lower the price of the drug. Do you think by giving patents, the price will come down or will it remain unchanged?

Prof. G. Bergami: My feeling is that the cost of the utilisation of the patent normally realised through royalties is so low in comparison with the promotion costs of any medicine that it does not affect the price practically. The price of medicine today all over the world is mainly composed of promotion costs, and the cost of the royalty is very little. This is demonstrated by the fact that the price in France is sometimes lower than in Italy for the same drug although France has the patent and we do not have the patent. This is an economical resu't that everybody can check. The same is the case in England. In many cases the prices in England are lower than in Italy. This gives me the feeling that prices are a different problem from patent. There is only a small connection.

Shri Arjun Arora: How do prices of drugs in Italy compare with those in other European countries where patents exist?

Prof. G. Bergami: From memory I can say that the cheaper countries in Europe are France and England. Then come Switzerland, which is like Italy. Then comes Germany where prices are a litt'e higher. So, we believe that the only country which has no patents is in the middle of this price line.

Shri R. P. Sinha: It has been represented to us by various witnesses that the inflow of foreign capital and technology to India will not be forthcoming if we weaken the patent law of this country. You have just stated that 21 per cent of the total foreign investment in Italy is in the pharmaceutical industry where there is no patent. Would you throw some light as to how the foreign capital is flowing into Italy in spite of the fact that there is no protection for these products?

Prof. G. Bergami: The lack of patent obliges the foreign producers to go direct to the market as they have to defend their product against competitors directly because they have to defend their product against competitors directly because they have no defence from the patent. Coming back to the problem of India, my opinion is this. If I am alone, I can calculate the real cost, as I will be able to sell so many tonnes or quintals. Otherwise, how can I make any presumption?

Mr. Chairman: By enacting a patent law, you want to prevent or increase the flow of foreign capital?

Prof. G. Bergami: The policy of the Italian Government until now has been to give freedom to the economy and the best results have been obtained.

Shri R. P. Sinha: Are the foreign investors in pharmaceutical industry

in Italy getting good returns in spite of there being no patent law there?

Prof. G. Bergami: The profit normally made by holders of patents is made by heavy promotion by foreign companies operating in Italy. Sales are related to promotion and through promotion profits are made.

Shri R. P. Sinha: We are told that the pharmaceutical industry will not be able to bear the cost of research without patent protection. You are spending in Italy 3 per cent of your turnover on research work in spite of the fact that there is no patent law there. How do you recover this expenditure on research?

Prof. G. Bergami: This small percentage spent in Italy in research is not spent by the thousand enterprises, but only by a few. A few enterprises spent at least 10 per cent or even more on research, because their progress depends on research. The researches do not pay immediately but they pay in the long run.

Shri Bade: How much foreign exchange is remitted every year by foreign firms in Italy in the shape of dividends, royalties and for technical know-how?

Dr. G. Delgiudice: Italy pays towards royalties and technical know-how to foreign companies about 45 billion liras. Italy does not get more than 2-3 billions of liras for their patents on drugs although receive many billions for other things like polymers, etc.

Shri Bade: You have got no patent bill till now. We have our patent law from 1911. Still, the Glaxo Company which is manufacturing about 153 pharmaceutical things under their own registered proprietory trade names and which is holding a number of patents in India, is manufacturing only 2 medicines here and all the other medicines are being imported from outside, because they have got patents in India. Thus they are exploiting the poor people. In the light of this experience of ours, how do you say that patent law will be conducive to the investment of foreign firms? Instead of manufacturing medicines here, they import them from outside. The patent law is misused.

Prof. G. Bergami: If there is a product that can be imported at a lower cost, it is no use for a country to produce that locally at a higher cost. It will be a big mistake. This was a mistake that Mussolini did and we paid very very badly for that mistake. In Italy we started the production of some vitamins, but we stopped when we saw that our production cost was many times the production cost of Roche who specialised in the production of vitamins. This happens often in the pharmaceutical field. The emphasis is on the minimum cost. That which is economical should be adopted. There are special cases, due to special needs or due to the existence of raw materials in a country, where it may be necessary to resort to local production. But I must say this is a mirage of local production. The local production should be economically convenient and then only it should be resorted. What is important is to have the lowest price and the lowest cost. This is very important for the economy of the country.

Shri Bade: Shall we come to the conclusion by this discussion, that our provision for compulsory licence is the only remedy for such foreign companies who are not investing money in India?

Prof. G. Bergami: I agree.

Shri V. M. Chordia: May I know whether it is not a fact that in the absence of any patent law in Italy, in the first stage the Italians could learn to imitate the products of others, in the second stage they could improve upon those products and in the third stage they could introduce new products, and by this they could save their money from being sent out of the country?

Prof. G. Bergami: The production of drugs change every year. The produ.tion of drugs today is not what it was 20 or 30 years ago. In Italy the indus.rialists are paying substantial sums for patent rights. The yearly cost paid in Italy for licences in the pharmaceutical field is about 45 billion liras.

Shri V. M. Chordia: Is it not a fact that even if you have a patent law for having foreign know-how you will have to pay the same amount as you are paying at present, but in addition to that you will have to pay for years more price than what you would have paid had there been producers in Italy and if there had been no patent law?

Prof. G. Bergami: If there is a pa'ent law we will pay practically the same amount, there will be no difference at all. Only when it is economically convenient an Italian industrialist will start production; otherwise they will import. The burden to establish whether it is convenient or not should be on the private enterprise. If the State is to decide that, we will be exposed to a lot of complications. I have personal experience of that when I was High Commissioner for Public Health. This was the period when penicillin was very scarce and developed only in the USA. We obtained from U.N.N.R.A. one plant to make penicillin. It was set up as a State enterprise. The plant was very old, it was modified and finally we started production. But the price was about two times more than the price of free enterprise. Finally we stopped production. The State is not aware of the real condition of the market and it takes too long to take a decision. So local production should be done only when it is economically convenient. Economical convenience may have a different origin—it may be cost, it may be existing facilities, it may be the availability of raw materials in the country.

Shri Wasnik: You have stated that the provision in the Indian Patent Bill for compulsory licence has negatived the patent protection. I understand that in the Italian Patent Bill that is before the Italian Parliament there is a similar provision in clause 8. How do you justify that?

Prof. G. Bergami: First of all, I must say that I am not the man who has prepared the law. We may have a different opinion. I must clarify that compulsory licence is completely different from licensing of rights. They are two different things. Italian law provides compulsory licence. According to that, compulsory licence is going to be given to reduce the bad effects of patents.

Shri R. Ramanathan Chettiar: You stated earlier that 21 per cent of the foreign investment in Italy is in the pharmaceutical industry. I do not know whether you have the figures with you. Earlier you said that 45 billion liras or something is invested. Is it 21 per cent of that or 21 per cent of foreign investment in Italy?

Dr. G. Delgiudice: This figure we do not have.

Shri R. Ramanathan Chettiar: There are certain American combines or cartels operating in Europe, like the American Cynamide Company, which have bought over some of the Italian companies. Are there any instances where an American pharmaceutical combine has purchased any Italian pharmaceutical industry and established itself in Italy?

Dr. G. Delgiudice: There are cases where they have majority shareholding in Italian companies, but these are few.

Shri R. Ramanathan Chettiar: For example, the Minnesota Mining Manufacturing Company has recently purchased two companies—one in France, La Bauchet, and the other one is Ferrania.

Dr. G. Delgiudice: It is not a pharmaceutical company.

Shri R. Ramanathan Chettiar: La Bauchet is collaborating with an Indian company in putting up a photo film plant in the Nilgiris and Ferrania is also interested in photo film industry. Like that there are instances even in regard to the pharmaceutical industry where they have purchased a few companies, like the American Cynamide Company case.

Dr. G. Delgiudice: There is the Lederle company in Italy which is American Cynamide Company. There is Pfizer in Italy and also Squibb as they are in India. They have come and invested their money there.

Shri R. Ramanathan Chettiar: Am I right in thinking that you have no anti-Trust law, like the Sherman law, on the American model to prevent foreign investment in any industry?

Dr. G. Delgiudice: Till now there was no such law in Italy but an anti-trust law is under preparation, and is under the Cabinet consideration.

Mr. Chairman: Thank you very much, gentlemen.

(The witnesses then withdrew.)

(The Committee then adjourned to meet again at 15.00 hours.)

II. Federation of Economic Organizations of Japan, Japan Pharmaceutical Manufacturers' Association and Japan Pharmaceutical, Medical and Dental Supply Exporters' Association Japan Patent Association, Tokyo.

Spokesmen:

(1) Mr. Shoichi Inouye.

(2) Mr. Shoji Matsui, Patent Attorney.

(The witnesses were called and they took their seats).

Mr. Chairman: Gentlemen, the evidence that you give will be printed and distributed to all Members of Parliament and Members of the Committee and will be laid on the Table of the House. Even if you want any portion to be treated as confidential, it will be printed and distributed to all the Members of Parliament.

We have received your memorandum and it has been distributed to all the Members. If you want to stress any point or make out any new points, you may kindly do so after which Members will put questions to you.

Mr. Shoichi Inouye: Mr. Chairman and gentlemen, it is indeed an honour for me to have this occasion to speak before such a distinguished assembly. I extend my heartfelt appreciation to those who are giving me this opportunity.

The Japanese delegation consists of Mr Matsui and myself. With your permission, we have brought an interpreter to assist us in answering your questions.

I was the Director-General of Patent Office of the Japanese Government for about 5 years from 1955 to 1960. After resigning the post, I entered Showa Denko, one of the leading chemical companies in Japan and I am now Senior Managing Director of Showa Neoprene Company, which is a joint venture between DuPont Company of the United States and Showa Denko of Japan.

Firstly, I would like to speak about the relations between patent system and national economy, particularly through our experiences in Japan, and later, Mr. Matsui will make a statement regarding our views on certain points of your Patent Bill from the standpoint of Japanese industry as well as the pharmaceutical producers in particular.

As I am speaking a foreign language I would like to ask your patience and indulgence. I want to read almost all my paper but it will take only 30

minutes or so. In the course of reading I will make some additional explanations.

The Federation of Economic Organizations, whom I represent here today, is the foremost organization of Japan's economic circle, with all the major enterprises participating in its activities. The Federation's voice has a leading influence in our country. The Economic Mission from Japan headed by Mr. T. Adachi, which visited this esteemed country this spring, was organized under the influence of this Federation.

In 1945, when the Second World War ended, our country stood in the midst of devastation. Our young brains were lost and production facilities were in ashes. Today, twenty years later, to many of us this seems merely to have been a bad dream. During this comparatively short period, our economic growth was very rapid, showing a yearly increase of about 20 per cent. In 1964, while the growth rate decreased, it was still as high as 11 per cent and our national income *per capita* reached 570 US dollars, tripling that of ten years ago. For your information, in 1965, it was 680 US dollars.

The major factor contributing to this extraordinary growth was the induction of superior technology from advanced countries abroad. It was decided that the most efficient and the safest way to fill the technological gap, created by the war, was to bring in technology which already had been proven successful on a commercial basis abroad. Japanese industries vied for such technological induction. As a result of this, today, a number of these industries have acquired worldwide standing which they would never have attained without the technology from abroad.

In 1955, Japan's payment for overseas royalties was 17 million US dollars. In 1965, this increased to 164 million US dollars. These figures, alone, may seem to indicate a large drain on our foreign exchange reserve. However—and this is a very important point, I think—if we were importing from abroad, today, the products which we are now producing domestically, we would be paying for their importation more than tenfold the royalties we are paying to produce them ourselves. Furthermore, the royalty payments can often be quickly offset by income from the exportation of the product concerned. Outstanding examples of this are our nylon and transistor radio industries which have brought in tremendous profit, far exceeding the amount of royalties paid out.

Japan's export of technology is not, as yet, large, Royalties received during 1965 amounted to 13 million US dollars, 8% of royalties paid out during that year. In recent years, original research and development in Japan have become even more active and a number of unique domestic technologies are being commercialized. All this is indicative of the beneficial effects of technological induction.

In looking into how and why a wide variety of technological induction took place and continues to take place in Japan, the outstanding reason is found in the existence of a long-standing, well-established patent system. Ever since she joined the Paris Convention for the Protection of Industrial Properties in 1899, Japan has respected and sufficiently protected, irrespective of nationality, patent rights which are regarded as products of the intellectual efforts of human beings. This attitude invited applications from abroad, and the assurance of sound protection of new inventions in the form of granting solid patent rights encouraged those abroad to transplant to Japan their know-how, when asked for.

The patent system of Japan is 81 years old this year. In 1899, while the patent system was still growing roots, Japan joined the Paris Convention, and clearly indicated her policy that Japan would benefit most by protecting inventions of other nationalities as well as her own.

Since then, modifications of the patent system have been made to accommodate various socio-economic changes. The patent law of Japan, as I said just now, was enacted in 1885. After minor changes were made three times, the amendment of patent law was put into effect in 1921. Then, 38 years later our current patent law was born in 1959, nearly seven years ago. But the basic principle of attempting continuous technological progress through the protection of inventors and the public disclosure of technology has never once been changed.

The number of patent applications in Japan are growing year by year. Especially in recent years, enterprises are becoming evermore active in research work to cope with technological innovations and the liberalization of foreign trade, and their attitude of wanting to protect such research results in the form of patent rights, manifests itself in the rapid increase of patent applications. Since 1962, the number of patent applications has increased at the rate of 10 to 20% each year, and during 1965, 82 thousand applications were made. When the number of applications for utility model is added to this figure, the total number of applications amounts to 180 thousand, ranking first in the world. Ten years ago the number of applications was less than half this figure.

It is noteworthy that the number of patent applications by foreign nationals are increasing remarkably in Japan. There were only about 7,000 such applications in 1955 but during 1965 this number increased to 21 thousand, which means that 26 per cent of the applications submitted during 1965 were by foreign nationals. This may seem not to be very large. However, for ultra-modern technology, such as the chemical field, the rate of applications tendered by foreign nationals exceeds 50 per cent of the total.

As for the granting of patents, less than 50 per cent of the applications made by Japanese nationals pass examination and become registered, while the rate of registration by foreign nationals is as high as 70 per cent. This fact proves that patent applications from abroad are more frequently of superior quality. In other words, 26% at the total applications by foreigners enjoy 36% at the total registration.

Such figures were achieved only because foreign nationals have had no doubt as to the sufficient protection of their patent rights under the Japanese patent system. In light of our experience regarding the smooth induction of foreign technology, while its role may not have been conspicuous, our patent system is the greatest single hidden contributor to the development of Japanese economy to the present level.

While Japan acquired much technology from abroad, she does not rely on this alone. Very serious efforts are exerted for the development of domestic technology.

I would like to emphasize this point which I am going to say now. When the number of patent applications from abroad was repidly increasing and when numerous technical tie-ups between Japanese and foreign companies were causing large sums of overseas royalty payments, there were those in Japan who seriously questioned the effect of patent rights protection as being against Japanese national interest. At that time, the majority believed, and it is still believed, that the original purpose of the patent system is not to allow an individual to hold in secret the intellectual products of his brain, but to lay it open to all so that industry and society as a whole will benefit from it. In compensation for this, the individual is given the right of exclusiveness during a limited period. New technology thus made open will then stimulate other reseachers toward further studies and as a result will become the basis for new and better inventions. In other words, level of technology is continuously upgraded by pooling the results of the

individual researcher for the benefit of all researchers. The patent system was born of human ingenuity, where it made possible for all to strive toward "better inventions through inventions". Therefore, it is necessary that inventions by foreign nationals be brought to Japan. What will happen if limitations were placed on our present patent system? It will mean that legal protection given to technology will be weakened, and this in turn, means less compensation given to inventors. That would certainly be of no help toward inducing better quality inventions. Where there is doubt and uneasiness as to the protection given by law, no new and useful technology from overseas will be forthcoming into Japan. Such a state will cause a wider technological gap between Japan and the other countries of the world. Whether it be a Japanese patent or a foreign patent, newer technology will help in developing our industry and this will stimulate the advancement of Japan's techno'ogy as a whole.

In any country, what can be more desirable than the existence of a high degree of inventiveness among the people? Inventions add to society something that did not exist before without depriving it of anything. The best way to encourage inventions is the patent system, and only under a reliable patent system will it be effective. This applies to foreign nationals as well.

We fear that if legislation was made whereby people, especially those abroad, would lose the desire to apply for patents and to supply technological information, it would be very much against the nation's interest since it will mean that the nation is attempting to sail against the international current.

I recall that the late Prime Minister Nehru said to the effect that one can easily let one's garden go wild, but it is no easy task to turn back the wilderness into a garden. The flowers of invention, indigenous and foreign, are blooming more and more in number and in variety in this garden of yours, and indeed it is my heartfelt wishes that this atmosphere in no way be clouded.

We have great respect for India's achievement in international society as a leading world nation and for the serious efforts you are making toward the realisation of various policies for the better development of your economy. The Economic Mission from Japan had an opportunity recently to discuss with your people the general economic problems our two countries face, and it was mutually confirmed that the strengthening of cooperation between the two countries will not only benefit us both but would contribute greatly toward the world as a whole. Business circles of Japan highly value the results of the Mission's visit, and the people of Japan earnestly desire an even closer friendship with the people of India.

We, in Japan, have a strong desire that whatever changes be made in your patent system are not of a nature that would possibly impede Indo-Japanese economic cooperation. Based on this thinking, I would like to express our concern over some of the articles in your Bill. (Please refer to my memorandum Page 9-10).

In concluding my testimony, may I point out that we, in Japan, are all sincerely desirous that the proposed patent bill will not hinder the growing inventiveness and research activities, and will not thereby become a debit instead of a credit to the development of your industries. It is also earnestly hoped that the bill will not mar India's good reputation in international society, and in particular, impede the growing economic relations between your country and Japan.

May I reiterate our experience and belief that a nation's development can be achieved if her patent system fully indicates the original purpose of such a system, namely the protection of inventors.

Finally I express my deep appreciation to you for your close attention.

and hope that what I have said here today might be of some benefit to you in future deliberations on this subject at your esteemed Parliament. Thank you.

Mr. Shoji Matsui: Your Excellency and Gentlemen.

It is a great honour and pleasure for me to deliver an opinion on the planned revision of the Indian Patent Law on behalf of Japan Patent Association, Japan Pharmaceutical Manufacturers' Association and Japan Pharmaceutical, Medical and Dental Supply Exporters' Association.

I would like to make my statement not from the general point of view but from our actual experience and after that, I would like to point out some points which are considered very important and controversial in Japan regarding your proposed Patent Bill.

Personally, I have long been engaged in various patent affairs, including licence work with firms abroad as the manager of the Patent & Licence Department of the biggest pharmaceutical manufacturer in Japan and as the Chairman of the Patent Committee of the Japan Patent Association. Also, recently, as the Chairman of the sub-committee of the Jananese group, I had a chance to study the subject of "The Model Patent Law for the Developing Countries and the Role of the Patent System" which was discussed as one of its agenda at the AIPPI Tokyo General Meeting held in this April.

For your reference, I tell you that the Japan Patent Association is not composed of specialists in law, but is a group of enterprises, the aim of which is to study the patent system from an industrial view point.

My opinion to be delivered hereafter has been derived from our experiences through 80 years history of the patent system of Japan which has played an important role in the development of the Japanese industry to the present prosperity. I would like to tell you that stronger the protection, the more advanced a country is technologically. I would like to give three examples.

In the first place, I wish to mention the fact that the processes for manufacturing chemical compounds are conspicuously developed in our country to the extent that the number of patent applications in the chemical field amounts to 30 per cent of all the patent applications, and that there are not a few examples to show that compounds invented and manufactured first in foregin countries are manufactured in our country according to some other new process developed indigenously.

However, in respect of research activity of creating useful and novel chemical compounds, it can be said that the achievement is not so remarkable as in the field of the manufacturing process.

It is well admitted in Japan that the afore-mentioned fact is attributable to the manner of a protection of invention under the Japanese patent system.

The Japanese Patent Law does not grant patent protection to the substance itself in the field of chemicals and drugs, but grants patent protection only to the process of manufacturing such compounds. Therefore, researchers and industrial concerns have been obliged to concentrate their creative efforts on discovering new processes which have possibility of being placed under the protection of the patent law rather than on finding new compounds or drugs. But an exception can be seen in the field of antibiotics.

In Japan, many novel antibiotics such as Kanamycin, Fradiomycin,

Trichomycin, Leucomycin, Sarkomycin, Mitomycin, and Brasticidin have been discovered. These are very important drugs in Japan, having been discovered by ourselves.

Although in the field of antibiotics also patent protection is given only to the manufacturing processes, the Japanese patent office has granted a wide scope of claims to such processes which cover new antibiotics manufactured for the first time.

As a consequence, such process inventions as above enjoy an ample protection which is almost tantamount to product patent, resulting in spurring incentive to have pharmaceutical manufacturers concentrate their efforts on discoveries of new antibiotics.

In anticipation of this powerful protection under process patents in the field of antibiotics, more strenous efforts of research have been directed to finding original antibiotics rather than to finding new processes for manufacturing the same old antibiotics.

We believe that such endeavours were mainly responsible for the discoveries of many novel antibiotics as mentioned above.

These facts delivered above tell us that the creation of the invention is spurred in such a situation where the patent protection is strong and sufficient.

As another example, I would like to tell you that Vitamin B1 is manufactured in Japan. Japan is the biggest Vitamin B1-manufacturing country. We are exporting Vitamin B1 not only to the United States but also to many European countries and Takeda is one of the manufacturing companies in Japan.

During the infancy of Vitamin B1 manufacturing technology in Japan, a foreign company obtained several Japanese patents covering a wide range of Vitamin B1 synthesis methods. As a result, Japanese pharmaceutical manufacturers had to work hard to find out a new process to manufacture Vitamin B1, a very important substance for the Japanese, which did not fall within the scope of the patents held by the foreign Company. If there had been an easy way to imitate or make use of the patented processes, Japanese companies would not have made such efforts for finding out new processes at the sacrifice of a large amount of money.

From this, it could be said that the fact that a Japanese company invented new and economical processes for manufacturing Vitamin B1 enabling Japan to export Vitamin B1 so manufactured was ascribable to the patent system and also to the patent protection thereby given to the foreign company.

Now Japan has come to enjoy an active export of Vitamin B1 to many foreign countries.

It should be borne in mind that the stronger the protection, the more the technique will advance. I would like to emphasize here three proints and I would like you to know our actual experience in this regard. I would add a few comments regarding the problem of know-how. Our experience shows that even an imitation following a prior art can hardly be done by simply referring to literature or patent specifications without know-how. It is noteworthy that most of the useful know-how will be introduced only accompanying foreign patents.

I myself went to Germany only to purchase the know-how-on patents. Two years ago I went to Austria; though the company is very small, they had an excellent know-how. I went to Italy to buy technical know-how. Why is know-how so important? Know-how mainly concerns the process which increases

the yield of the manufacture or improves the quality of the product. Then we can produce the same thing at a lower cost. More than that, the know-how can be used in the field of other drugs. For instance, we have been introducing technical know-how from American Cyanimide Co. in connection with the manufacture of tetra cycline. We are paying royalty and when we are paying royalty, we are obtaining the uptodate technical know-how free of charge. That charge is included in the royalty but by obtaining such technical know-how the cost of manufacture of tetracycline sharply went down. Why the inventor did not try to obtain a patent regarding know-how is a problem. The technical know-how concerns very small section of the manufacturing process. If the know-how is disclosed on the paper, many people can use that know-how but the inventor of the know-how cannot detect those who are using it free of charge. Then he does not try to disclose the know-how. He only discloses the main part of the invention by patent specification. That is why I consider that the know-how is important in connection with the patent protection.

That is my statement from the general point of view. I think I have finished my statement upto page 5. From page 5 I have given my opinion regarding the respective provisions of your proposed Patents Bill which I would like to briefly mention.

First I would refer to Sec. 48 of your proposed Patents Bill. This refers to patent rights not infringed when used for certain purposes. In Japanese Patent law this kind of provision is not included. We do not have it. I think this section will not only affect the foreigners adversely but also will affect adversely your future progress of technology and industry because if this kind of provision is included in your Patents Bill, I think there is a great fear that the importation or making can be readily carried out under this section. Many people would be discouraged to invest for new plant or to introduce foreign technology under patent rights. That is a reason why I would like to recommend deletion or amendment of this Section.

Section 53—term of patent—in this section the most problematical point is the duration of the patent which is stipulated as 10 years. In Japan there is no discrimination in the duration of the patents irrespective of the field of invention. All patents are under protection for 15 years. From the date of publication the patentee has the right to enforce his patented right to exclude others from using. From that date patent rights start and they continue for 15 years.

In Japan we do not have any provision for renewal of the life of the patent. 15 years is final. But in the pharmaceutical industry many leading companies now consider this 15 year protection as too short because it becomes very difficult to find new drugs which cost more and more and one new drug can be created only out of 3000—5000 products. The cost is very high now. This 15-year protection seems to be a little short in the pharmaceutical field. Even when one discovers a new drug effective for one disease, we have to carry out more and more research—safety test, clinical test, etc. Though in Japan it is not strict as in the United States, it takes a very long time and generally it takes more than five years before a new product is on the market. We have much experience in licensing agreements where a patentee wants to get royalty after the expiration of the patent. I have personal experience of a licensing agreement by which a company will pay royalty after the expiration of the patent in Japan. On the other hand, we have the case in foreign countries where after the expiration of the patent, we still get royalty from the licensee. If a patentee has spent a lot of money

for a new drug, of course, the patentee would like to cover such expenses by obtaining royalties. Than sometimes a patentee wants to get a royalty after the expiration of the product. Therefore, looking from these points of view, ten years, I think, is a short period and it would discourage the inventor from giving the licence to your country.

Sections 66 and 89 concern the revocation of patent in public interest. In Japan this kind of provision is not included. The old law had this type of provision but it was never used and it only gave fear to foreigners. In our opinion, it was a harmful provision from the point of view of introducing foreign technology from other countries. But in a recent revision of the patent law, this provision was not included and so our present law does not include this revocation provision and there has been no harm to Japan so far.

So from our experience, I would like to recommend that this clause be either amended or deleted.

I understand sections 84, 93, 95 and 97 concern compulsory licence. The idea of compulsory licence to work the patented invention is adopted by the Japanese Patent Law as well as in the Model Law drafted by BIRPI. But frankly speaking, the ground for granting a compulsory licence in this Bill is very severe and has the effect of placing undue and strong restrictions on the rights of a patentee. For example, sub-section (2) of section 84 provides that even a contractual licensee is entitled to apply to the Controller to amend or modify the existing right of contract. According to sub-section 2 of section 93, the Controller may cancel an existing licence when he thinks fit in granting a compulsory licence. I think this is a bit too strong, looking from the Japanese way of thinking.

The next point is sub-section 3 of section 93. This sub-section provides that in granting a compulsory licence, the Controller may by order deprive the patentee of any right which he may have as patentee and revoke all existing licences in respect of the invention. This way of thinking is not an acceptable way of thinking in Japan. I think this is too strong because the contractual licence was last agreed between these parties, and we, Japanese, would like to respect an already existing contract. My opinion comes from such a point of view.

Moreover, sub-section (3) of section 95 provides for Governmental authorisation of importation in case of compulsory licence. I think this clause concerns section 48. This is not good for your country in introducing foreign technology. I understand this sub-section 3 of Section 95 concerns the governmental authorisation for importation and one other point is sub-section 1 of section 97. Under this sub-section 1 of section 97, the Government may designate the patent at any time, with regard to which the compulsory licence shall be granted, in order to satisfy public interest only by making a declaration to that effect in the official Gazette. I think, this is too severe as compared with Japanese compulsory licence system. Fortunately, I have the English translation of current Japanese Patent Law. I would like to leave it here for your perusal. Of course, in Japan we have provisions regarding compulsory licence system. The three cases where compulsory licences are granted in Japan are—(i) in case a patented invention has not been adequately worked for more than 3 years; (ii) in case the working of a patented invention is particularly necessary in public interest; (iii) if the junior patentee's invention cannot be worked without using senior patentee invention. In that case the junior patentee can ask for compulsory licence through senior patentee. These are the three cases in Japan of compulsory licences. Of course in that case, there has to be mutual consultation. If the agreement could not be reached between the

patents then a special committee will consider the case and give award and sometimes compulsory licence will be granted and sometimes not be granted. And if the royalty rate decided at such special counsels for granting compulsory licences is not acceptable, a patentee can appeal to the law court for increasing, or sometimes decreasing the royalty rates. Of course, there are much more complicated due processes to protect the rights of patentee. This is only for your information.

I would like to mention regarding your Sections 87 and 88. Those sections concern "Licences of right" and fixed royalty rate. As regards licences of right, we do not have this kind of provision in our Japanese Patent Law. In Japan, if patentholder would like to show his intention to give licence to anybody, he can put his intention on the specification, voluntarily he can do that, but no such compulsory obligation is there. I think this is too strong, too severe. Specially, in pharmaceutical things, as I told you, it takes more than 5 years generally to exploit and to launch the product on the market. If licence of right was described on the specification at the time the patent was granted in your country, I am afraid, all patents concerning pharmaceuticals will be destined to be revoked, because within 2 years it will be very difficult to work. That is the reason why—I do not like this to be included in your Patent Bill.

The next point is regarding the royalty rate. I understand, 4 per cent of ex-factory works price is set in these provisions. But fundamentally, I think, it is very difficult to set a ceiling on royalty rate. Our fundamental thinking is royalty rates should be decided case by case and sometimes less than 4% and sometimes more than 4%—and it is the usual international practice also that the royalty rate will be counted on net sales price of manufacturers but not on the net ex-factory works price, as provided in this. I think, this way of thinking is not usual. Internationally, this is not the accepted way of thinking. As you know, Japan was one of the very poor countries which needed technology to be imported from foreign countries. Then in order to save the loss of foreign currency, it was true that the Japanese Government has made a great effort for selecting foreign technologies to be introduced, taking into due consideration their importance for developing and promoting the technological research and industries in Japan by sometimes ordering amendment or modification of contractual agreements, when such stipulations are disadvantageous to Japan, Government orders amendment, and if the patentee foreign industry do not agree to amend that, it was very difficult to introduce that technology. But in our experience, mutual agreement was finally reached.

One point I would like to emphasise is, it is hardly deniable that also in Japan, there is a minor opinion of desiring to put strong restrictive conditions upon the patent rights or to weaken the patent rights, but this minor opinion apparently aims at enjoying the benefit from easy imitation of techniques invented or devised at the cost of someone else. Therefore, it may safely be said that this minor opinion is supported confinedly only by small number of enterprises which are far behind in research activities.

Next point is concerning Sections, 99, 100 and 102. I understand these provisions concern Governmental use and acquisition of the patent right. Frankly speaking, this kind of provision is not included in Japanese Patent Law. Old Patent Laws included this kind of provision, but there was no benefit under these provisions. It is only harmful to the sound growth of technology, because foreign investors feared that this clause might be forced in certain cases. Then at the time of revision of our Patent Law, this kind of

clause was abrogated. The present Patent Law does not have it.

Next point is concerning section 116. This provision concerns limitation on appeal to the law court regarding the administrative decision. In Japan, against all kinds of administrative decisions . . . In Japan, the public can appeal to courts for relief against all kinds of administrative decisions, not only in patent cases. I think in your country this restriction on appeal in this patent law is too restrictive. I think this must be broadened a little.

Lastly, I would like to mention that section 162, which shortens the period of the patent for pharmaceuticals to 10 years with retroactive effect will have an undesirable effect. In Japan the patent law was amended many times, but it never deprived the public of any right. I think this retroactive effect will create a feeling of distrust among the people.

As a conclusion, I would like to suggest, through our experience, that in developing countries the moderate compulsory licence system in combination with flexible operation of other legislation, such as our Foreign Investment Law which can control a payment of foreign currency from the viewpoint of financial situation without depriving the patentee of his fundamental right, will produce satisfactory outcome for the development of their industries.

Lastly, I express my sincere thanks for your kind attention. Thank you.

Dr. C. B. Singh: Table No. 1 of your Supplementary Material gives the production values of pharmaceutical industry in Japan for the years 1960 to 1965. Do you think this increase is the result of strong patent protection?

Mr. Shoji Matsui: Patent protection is one of the big reasons why our industrial production has gone up. There are many other reasons. For instance, the demand for medicines in Japan has increased because of the increasing standard of living in Japan and because of the introduction of the Health Insurance System. More than 99 per cent of the whole nation is now enlisted under this scheme, by which they can receive medical treatment very easily. Then, the total consumption of pharmaceuticals has increased very much, and the pharmaceutical industry expanded its capacity to meet the demand.

Dr. C. B. Singh: In Table 3—Amount of domestic supply of medicines (1961) the figure for Japan is given as 601. Why has it gone up so much? Will it be correct to assume that it is as a result of the rising standard of the Japanese economy?

Mr. Shoji Matsui: The import of pharmaceuticals from foreign countries is not so big as compared to domestic consumption. One of the biggest reasons for production increase is increase in domestic demand. The Japanese pharmaceutical industry can thrive on such demands and can expand its factories to meet such demands.

Dr. C. B. Singh: On page 3 of your statement, you have made a statement at one place that you are more or less protecting the process and you have given preference to the processing of products at some other place. In other words, it is rather confusing. Do you want patents for the process or for the products, or do you want a combination of the two?

Mr. Shoji Matsui: In Japan, we have now the process patents, but recently, some leading pharmaceutical industries wanted to introduce product patent system in Japan, because under the process patent system, when one company invents a new product, they have to defend some other people imitating the same product by using some other process. Then, a company who invented quite a new product, has to make effort so as to defend it and not to

progress upon it. That is one of the defects of the process patent system. Leading companies who would like to find new drugs would like to introduce product patent system, preventing others from doing so. By introducing the product patent system, one inventor who invented new compounds, can concentrate its effort for finding another new drug. Opinions are 50-50 in Japan. I may say it very frankly.

Dr. C. B. Singh: Evidence has come that process has become more or less standardised, and by the same process, with slight modifications, probably you can produce many products. The processes have become more simplified, and as a result of this, the modern tendency is to include both process and product. Now, will you tell us clearly whether it will be an improvement if in our Bill we bring the process along with the product in the matter of patents? Will that be an improvement, according to your opinion?

Mr. Shoji Matsui: Do you mean which is better, product patent, or process patent?

Dr. C. B. Singh: Process *cum* product.

Mr. Shoji Matsui: That is a very difficult question. I think in your country product by process patent will be better at the present stage, but in future, you must introduce product patent.

Mr. Chairman: In your statement, you have stated that process patent in Japan has contributed largely to the greater inventions for new processes, and it has developed your pharmaceutical industry very much. Do you stand by that statement?

Mr. Shoji Matsui: Yes, according to the system of process patent, our processes developed very much in Japan, but in the United States, they have product patent system.

Mr. Chairman: We are not concerned with the United States now. I want your opinion about your own industry. You have said that the process patent in Japan has really contributed to the industrial development of Japan. Is that correct?

Mr. Shoji Matsui: Yes.

Dr. C. B. Singh: On page 4, the witness has mentioned that as a result, Japanese pharmaceutical manufacturers had to work hard to find out a new process to manufacture Vitamin B1, which is very important for the Japanese, which did not fall within the scope by the patent held by the foreign company. That is why I am raising this question. There is a doubtful exposition here, according to his own statement. I want him to clear that point.

One more thing. On page 6, it is mentioned that the clause empowers the manufacturer to import any patented medicine or drug not only for its own use but also for distribution to the hospitals or medical institutions maintained by or on behalf of the Government. What objection has he got? Ours is a sort of democratic socialism, and we need all these things for the general use of the poor people. If the Government want to take it, do you mean to say that the Government would pay compensation and compensate the companies?

Mr. Shoji Matsui: At least Government must pay some compensation.

Dr. C. B. Singh: Lower down, you have mentioned that each sub-section of section 48 has every possibility of being widely applied, depending on the interpretation of the wording "for the purpose merely of its own use", because nothing is specifically defined by "the purpose of governmental use." You have also said that the wording "by or on behalf of the government" adopted through sub-sections (a), (b) and (c) makes it possible to be interpreted that importation by any person shall not be deemed to infringe a patent right, as far as it concerns the governmental use.

Mr. Chairman: Suppose there is an epidemic and we want certain medicines. Government has to take action. To meet such emergencies, this provision is made. These powers are vested with the Government of Great Britain, Germany, etc. This provision is made to vest the Government of India also with that power. What will satisfy you, as a patentee?

Mr. Shoichi Inouye: In Japan we do not have any system like that. In case of emergency Government will take recourse to compulsory licensing. That is enough.

Mr. Chairman: Compulsory licensing means authorising somebody to set up a factory and manufacture the drug. That will take time. But when there is an epidemic, we want medicines immediately. We will give a licence of right and anybody can import or manufacture it. In such circumstances, what will satisfy you as a patentee to give the drugs to us? There was an outbreak of plague in Bombay and a particular drug was sold at a very high cost. One of our research institutions wanted to manufacture the drug in India, but the company came in the way and frustrated the attempt for 3 years or so, by which time the need was over. To meet such emergencies, this provision is made.

Mr. Shoji Matsui: In Japan we do not have such a system.

Mr. Chairman: Here our people are poor and we must supply the medicines to them. If the patentee refuses, what is to be done?

Mr. Shoji Matsui: I think the cases must be more specifically described.

Mr. Chairman: The section is quite clear. Only in such circumstances the licence of right will be granted. If you want some compensation, that can be looked into. But the power must be available to the Government to take action in such emergencies. I hope you agree to that.

Mr. Shoji Matsui: Yes.

Mr. Chairman: We will adjourn now for lunch and meet at 3 P.M.

(The Committee then adjourned to meet again at 15-00 hours)

(The Committee re-assembled at 15-00 hours)

Shri Kashi Ram Gupta: You have mentioned that a lot of foreign capital is employed in Japan. May I know whether this is in collaboration with the Japanese capitalists or that capital is independent of the Japanese capital?

Mr. Shoichi Inouye: That is in collaboration with Japanese capital. In joint investments between Japanese and foreign people, the ratio of the share capital is dependent upon each case, but generally speaking the maximum is on a 50 : 50 basis. In many cases the Japanese side has a majority.

Shri Kashi Ram Gupta: Do you mean to say that there is no foreign concern which has got the total capital investment without any Japanese capital?

Mr. Shoichi Inouye: Generally speaking, no. But, I am afraid my answer has led to some misunderstanding. There are two types of investments with foreign collaboration. One is the establishment of a joint company between Japanese people and foreign people. There is also the other type where the contracts are only to induce foreign technology into the operation of Japanese companies.

Shri Kashi Ram Gupta: Is it a fact that in the pharmaceutical industry in Japan American capital predominates?

Mr. Shoji Matsui: In the pharmaceutical industry, in most of the cases, only technical introduction is seen. Japanese companies introduce

foreign technology or know-how only by paying lower fees. But in some other cases Japanese companies establish joint investment companies and manufacture the product. If you take the ratio of joint investment companies and simple technical introduction, I think the number of cases where only simple technical introduction is done will be more.

Shri Kashi Ram Gupta: Is it a fact that the largest number of patents in the pharmaceutical industry in Japan are owned by Americans as foreign concerns?

Mr. Shoji Matsui: At present the position is that a large number of patents in pharmaceuticals are owned by Americans among foreigners.

Shri Kashi Ram Gupta: In your Patent Act is the date of publication different from the date of filing of the application?

Mr. Shoji Matsui: In Japan the life of the patent starts from the date of publication. At the same time, the life of the protection starts.

Shri Kashi Ram Gupta: Is the date of publication the same as the date of filing of application?

Mr. Shoji Matsui: No.

Shri Kashi Ram Gupta: What is the difference between the two?

Mr. Shoichi Inouye: After the receipt of the patent application by the Japanese Patent Office, the examiners will take some time to examine it. When the application passes that examination, the Patent Office will publish it in the Official Gazette. That is the date of publication.

Mr. Chairman: What is the time lag between the date of application and date of publication?

Mr. Shoichi Inouye: As I explained in the morning, the number of patent applications received by the Japanese Patent Office has increased by leaps and bounds. So, it will take a longer time now to examine them compared to the position a few years ago. It also depends upon the field of technology. For instance, in the field of petro-chemicals and electronics there are so many important applications compared to other fields. In a field where the applications are so numerous it will take $2\frac{1}{2}$ years to 3 years.

Shri Kashi Ram Gupta: What is the time lag between the date of publication and the date of grant of patent?

Mr. Shoichi Inouye: After the publication of a patent application there is a time limit for opposition. During the two months any person could raise objection. If there are several objections, it will take a longer time to grant a patent. If there is no objection, it will be granted immediately after the period of two months is over.

Shri Kashi Ram Gupta: Suppose there is objection from many quarters. How much time will it take to get a patent?

Mr. Shoichi Inouye: It will depend upon the nature of the patent, the objections raised etc. Generally speaking, it will take six months to one year.

Shri Kashi Ram Gupta: Are you aware of the fact that there is a patent Bill in Italy which provides a period of ten years for drugs? Has your industry sent any memorandum to Italy in this respect?

Mr. Shoji Matsui: I understand that in Italy there is no patent protection for pharmaceuticals. They have a Bill under study.

Shri Kashi Ram Gupta: They have introduced a Bill in July 1965. It is on the anvil.

Mr. Shoji Matsui: Yes, they have a Bill under study. But I do not know when it will be passed.

Mr. Chairman: Have you opposed it?

Mr. Shoji Matsui: No. My understanding is that it will take a longer time before it becomes law.. I do not know, I have some connection with the patent attorneys in Italy; I have not received any information from them.

Mr. Chairman: The model law also prescribes a period of ten years.

Shri Kashi Ram Gupta: On page 49 of the model law there is a commentary that in certain cases the period can be 10 years from the date of grant of the patent. Some countries have it from the date of publication and some from the date of specifications—that means the same thing—but they say that some countries want it from the date of grant of patent in which case the period can be ten years.

Mr. Shoichi Inouye: Mr. Matsui was in charge of the model law as the Chairman of the Patent Committee of the Patent Association of Japan; so, he would be giving you an answer.

Mr. Shoji Matsui: This sentence reads "at least ten years from the grant".

Shri Kashi Ram Gupta: Are you agreeable to this?

Mr. Shoji Matsui: I think, at least ten years from the grant is all right, but in the pharmaceutical industry many companies in Japan need 15 years for making investment to find new drugs. That is my opinion and also Japanese opinion.

Mr. Chairman: You are a party to this model law.

Mr. Shoji Matsui: I understand, this model law was drafted by some 10 or 20 developing countries, but Japan was not on the drafting committee.

Shri Kashi Ram Gupta: You have given certain suggestions for deleting or amending certain clauses of the Bill. Most of them relate to drugs. Are you aware of why these clauses have been brought in by Government? It is mostly because we have the experience of the working of patents by foreign concerns and their misuse. In the light of that we have put in these clauses. Have you considered that? When you gave your opinion, were these points before you? Did you know what was the background for bringing in these clauses?

Mr. Chairman: They would not know it.

Shri Kashi Ram Gupta: Why could not Japan make use of the Indian patent law as it exists today up till now?

Mr. Chairman: They are collaborating in India.

Shri Kashi Ram Gupta: To what extent?

Mr. Shoichi Inouye: To our knowledge there are about 150 cases of Japanese investments in your country. That is in two forms—one is joint venture or joint investment company and the other is as contract for the introduction of technology.

Shri Kashi Ram Gupta: Are they mostly in drugs industry or mostly in industries other than drugs?

Mr. Chairman: They are collaborating in the electrical industry also.

Shri Kashi Ram Gupta: All right.

How does your present law of 1959 differentiate from your law of 1921? What are the main features of difference?

Mr. Shoichi Inouye: The current patent law provides more protection for the patentee.

Mr. Chairman: What was the earlier protection?

Mr. Shoichi Inouye: I would like to explain it in detail. The procedures concerning infringement of patent rights were not provided for in the old law. The provisions of the civil code were applied. But in view of the special nature of the patent rights, the following provisions were newly established in the current law, namely, in regard to the right to demand discontinuance of act of infringement of the patent right, the presumption of the amount of damage caused by the act of infringement and the presumption of negligence. The provisions concerning revocation and confiscation of patent rights were abolished.

Mr. Chairman: They were there in the earlier Act.

Mr. Shoichi Inouye: Yes. We had the provisions concerning revocation and confiscation in the old law but they were never put into practice.

Mr. Chairman: When were they abolished?

Mr. Shoichi Inouye: In 1959.

Mr. Chairman: Were the provisions of licence of rights also there?

Mr. Shoichi Inouye: We have never had such a system.

Shri Kashi Ram Gupta: You have given your opinion that the period of 14 years for industries other than drugs industry is reasonable. Many clauses of this Bill do not relate to patents other than drugs. May I conclude that you are in greement with our Bill to that extent in so far as it applies to industries other than drugs?

Mr. Shoji Matsui: So far as period clause is concerned we agree. According to your provisions, the patent right cannot work from the date of application. Then, if the examination takes a long time, the duration should be more.

Shri Kashi Ram Gupta: It is from the date of the completion of the specifications.

Mr. Shoji Matsui: But not the sealing.

Shri Kashi Ram Gupta: Even according to your law, it is not the sealing. I want to know whether you are agreeable to this for industries excluding the drugs industry.

Mr. Shoji Matsui: Yes.

Shri Shyamnandan Mishra: I want to seek one clarification in respect of Table No. 16 of your Supplemental Material. There, a comparison has been made between the prices in Japan and in the United States. I am not able to understand which is the price in the United States and which is the price in Japan.

Shri Shoji Matsui: Price 'A' is the Japanese price.

Shri Shyamnandan Mishra: That is not mentioned there. If price 'A' is the Japanese price, it is quite favourable. That is all right.

The second point is whether in your country any correlation has been established between the grant of patents and the inflow of foreign capital. This document is a valuable document. I think this would serve us a great deal even with regard to the understanding of the Japanese economy and its growth. We are grateful to you for supplying this information. But we would also like to know whether you have any figures with regard to the inflow of private foreign capital from the United States or from any other country and, if so, whether you can establish some kind of relation bet-

ween the grant of patents and the inflow of the private foreign capital, that is, you can say, for example, over a period of 10 years or 5 years the number of patents granted is so much and the amount of private foreign capital is so much. I would like to know something about that. This point has been very much stressed in the evidence before us. It has been said that if you want a large amount of private foreign capital to come to your country, then you should be quite liberal with regard to the provisions in respect of patents. I would like to take some lessons from the experience you have gained in Japan. Have you got any figures in respect of this?

Mr. Chairman: That will be from 1959 to 1965.

Shri Shyamnandan Mishra: This information is not contained in this note.

Mr. Chairman: How far the flow of capital increased as a result of the amendment to the Patent Act, 1959?

Shri Shyamnandan Mishra: How much inflow of capital could be related to patent?

Mr. Shoichi Inouye: First I would like to speak about the cases of foreign technology induction in Japan from 1959 to 1965. These are cases of foreign technology induction approved by Government:

1959 . . .	153
1960 . . .	327
1961 . . .	320
1962 . . .	328
1963 . . .	564
1964 . . .	503
1965 . . .	472

I would now like to tell you about the total amount of introduction of freign capital, for the same period.

1959	..	154	million US dollars.
1960	..	201	do
1961	..	505	do
1962	..	523	do
1963	..	690	do
1964	..	738	do

I do not have the figure for 1965.

Mr. Chairman: I think the 1962 figure is wrong.

Mr. Shoichi Inouye: It is 523 million U.S. dollars.

Shri Shyamnandan Mishra: This seems to be the total amount of foreign capital. What portion of it could be related to the patentee investment?

Mr. Shoichi Inouye: The amount which I mentioned includes technical tie up, *i.e.*, contract of technological introduction and investment on securities.

Mr. Chairman: How much of it is due to liberal patent?

Mr. Shoichi Inouye: I am afraid, I do not have the breakdown.

Shri Shyamnandan Mishra: Would it be possible for you to give that information later?

Mr. Shoichi Inouye: Yes.

Mr. Shoji Matsui: Technical introduction is an investment from a foreign country in the form of technical know-how. The price of the patent right is sometimes calculated by law courts. Such patents are invested as stocks in Japan though cases are few. But in many cases, in regard to technical introduction, there is no official investment of foreign money, but when joint ventures are established in Japan, at that time American/European countries bring money to Japan. We have to consider types of investment.

Mr. Chairman: Can you say how much of this is due to the liberalisation of the Patent Law.

Mr. Shoji Matsui: Do you mean the estimate of the price of foreign technology?

Mr. Chairman: Not the price. How much of this increased investment is due to the liberalisation of the Patent Law that you have passed

Mr. Shoji Matsui: We paid royalty for the foreign patents introduced in Japan.

Mr. Chairman: That is what you paid. They have invested money in your country and you said that foreign investments have increased on account of the liberalisation of the Patent Law. How much of that can you attribute to this liberalised Patent Law?

Mr. Shoichi Inouye: Of course, the contracts of technological introduction have been based on the existence and protection of patent rights. I can not tell how much of foreign investment into Japan was due to the current Patent Law. But we believe firmly that many cases of technical induction were achieved only because foreign nationals have had no doubt as to the sufficient protection of their patent rights under the Japanese Patent Law.

Shri Shyamnandan Mishra: So far as this Table No. 16 is concerned, other prices seem to be quite favourable in Japan, but, so far as this streptomycin is concerned, here the differenec is very large. Yours is 83 as against American 28. This seems to be rather large—nearly 3 times.

Mr. Shoji Matsui: The price of streptomycin in Japan is very expensive. The reason why it is high is that production scale is not big; scale of production is not as big as in the United States. Then the cost is expensive in Japan.

I would like to add to my answer to your previous question. Please refer to my Table 22 which concerns the annual savings of foreign exchange made by way of introduction of foreign technology. In 1964 the savings on pharmaceuticals made under foreign technology is shown here. This is almost 9 per cent of the total production of Japanese pharmaceuticals and for this production we paid royalty shown in item (c)— 6,398,000 dollars. But if we imported these products instead of introducing technology, we have to pay the same amount with those shown in (d). This royalty payment means that the balance of (a) and (c) which is shown in (f), the final saving of foreign money by introducing foregin technology.

Shri Shyamnandan Mishra: This is very useful, but in that case as you have given information so far as the amount of foreign investment in your country is concerned, can you give us the remittance of profits abroad year-wise? What were the amounts of profits remitted abroad?

Mr. Shoji Matsui: I am sorry that data is not available with me now. We have not studied it. If that data is available we will send it later.

Shri B. K. Das: In the memorandum submitted by the Japan Patent Association of which he is the representative, C1.47 of our Bill has been discussed on page 4. It says that there is no provision for the burden of proof in any section of this Bill and there would be much difficulty in protecting the right extended to substances made by the patented processes. So it has been suggested that the following phrase might be added at the appropriate place in the Bill. The phrase is: "If a patent is in respect of a process for the manufacture of a new product, the same product manufactured by a third party, shall in the absence of proof to the contrary, be presumed to have been manufactured by that process." So the burden lies on the third party.

Mr. Shoji Matsui: That is a very important point. We have the same provision in the Japanese Patent Law. Art. 104 is the clause under which the burden of proof is shifted to the possible infringer.

Shri B. K. Das: You think such a provision should be there. We have suggested process patent only in our Bill and you think such a provision will be able to protect the right of the process patent adequately in your opinion. But such things have come to our notice that one patentee holds so many process patents—more than one on the possible processes patents —4,5, 6 or 7—and he is exploiting only one. What is your safeguard against such things?

Mr. Shoji Matsui: In Japan, this is how you interpret the provision regarding the burden of proof. If a patentee has three process patents and is using one patent only and if a possible infringer may manufacture the same product by some unknown process, then even if more than three processes are known, still in Japan the possible infringer has to prove that his process is not infringing upon the rights of the patentee in regard to the product.

Shri B. K. Das: Will such a case be covered by the provision you have suggested? You have spoken of the third party, but if the same patentee holds more than one process patent, say three, and is employing only one process to prevent a third party from doing another process, how do you safeguard against that?

Mr. Shoji Matsui: The provision regarding the burden of proof is always applicable irrespective of the fact that the patentee has one patent or many patents.

Dr. C. B. Singh: On page 3, para 4, he has said "as a consequence, such process inventions as above enjoy an ample protection which is almost tantamount to product patent, resulting in spurring incentive to have pharmaceutical manufacturers concentrate their efforts on discoveries of new antibiotics."

Mr. Shoji Matsui: In the case of antibiotics, if the main point of invention is in finding new micro organisms to produce a new antibiotic, then according to the practice of examination in Japan, if the first inventor finds one organism, patent is granted not only for one organism but also for many, many organisms. Then the first inventor need not to carry out process study to find out some other micro organisms. If a process patent is given only for one micro organism, then there is a possibility of other people carrying out studies on micro organisms which will produce the same product; and then the first inventor has to carry out research for the process for defence. But in this case, there is no necessity to make a defence research. But in the case of chemical inventions, if he finds one process, the patent is granted for only one process. Then he has to carry out research to find some other processes if he wants to find out other processes by himself for defence. Otherwise other people may find other processes which do not fall within the scope of the first inventor's process patent. Those who find out new processes can manufacture the same product.

Dr. C. B. Singh: On a point of clarification, you have been mentioning different types of micro organisms. Are you referring to different organisms or different salts of the thing? For example, you can have sodium salt or potassium salt or calcium salt of streptomycin. I think you are referring to different salts of the same organism.

Mr. Shoji Matsui: In the manufacturing process of antibiotics, the fermentation process is a very usual one—almost the same in every manufacturing process. In other words, in the manufacture of streptomycin, tetracyclin, etc., the actual fermen-

tation process is very similar. The only important difference is the micro organism to be used for manufacturing the finished product. It is almost impossible from one micro organism to produce streptomycin and tetracyclin at the same time.

Shri B. K. Das: Will not the patent office be able to take care of that, whether it is a new process or a variation of the same process?

Mr. Shoji Matsui: In the patent office, we examine only the specifications. We usually do not look at the actual living organisms. But if a case of infringement comes up and the patentee sues the possible infringer, then the actual strain will be submitted to the law court and actually examined. If the micro organism belongs to the same species which is under patent protection, then it would result in infringement.

Shri R. Ramanathan Chettiar. One question on the general aspect. When our patent Bill was published, people in your country who are actively associated with the pharmaceutical industry and also representatives of your benign Government had expressed lot of misgivings about the Indian Patent Law. Could you explain to us what were the reasons that had impelled you to have misgivings about our Bill? Further in the third week of March, *i.e.* on the 18th March, you agreed to come before this Hon'ble Committee of the Parliament to give evidence but your Excellency Ambassador here informed our Secretariat that it is not possible for the Japanese pharmaceutical industry to appear here because they want further time to study the Bill and then requested for further date. I would like you to tell us the reasons that had impelled you to have misgivings about our Bill.

Mr. Chairman: You can drop it.

Shri R. Ramanathan Chettiar: They are going to clarify, Sir.

Mr. Shoichi Inouye: We obtained the Indian Patent Bill last year and studied very carefully. I cannot understand the reason why you said about our having misgivings about the Bill. We have no groundless misgivings concerning your Bill.

Shri R. Ramanathan Chettiar: I am glad to have that clarification. Another thing I want to ask is: In the pharmaceutical industry in Japan, could you give us—even if you do not have the exact figure—the percentage of the actual foreign capital and particularly the capital invested by the United States?

Mr. Chairman: He has given it.

Shri R. Ramanathan Chettiar: No, Sir, not the U.S. capital.

Mr. Chairman: All the details are given there.

Mr. Shoji Matsui: I am sorry, I do not have now the actual data about the amount invested by the United States in pharmaceutical field, but I can say that the total amount of the foreign investment is negligible looking from all thhe Japanese pharmaceutical industry's investment.

Shri R. Ramanathan Chettiar: Negligible?

Mr. Shoji Matsui: Very small as compared with Japanese own investment.

Shri R. Ramanathan Chettiar: You have said in 1962-63, 523 million dollars . . . .

Mr. Shoji Matsui: In Japan, as you find, there are 10 or 20 pharmaceutical companies which are producing half of the total pramaceutical production. These companies are completely Japanese companies. No foreign investment was made. Technical introduction, of course, we are receiving.

Mr. Chairman: Am I correct if I say that the only foreign investment in Japan is that of U.S.A. and no other country has any considerable investment.

Mr. Shoichi Inouye: No, Sir, there are investments from U.S.A., Great Britain, West Germany etc. But, as Mr. Matsui has answered, so far as the pharmaceutical industry is concerned, there is almost no foreign investment. In other words, in other industries like petro-chemical industry, electric machine industry and so on, we can find foreign investment.

Shri C. B. Singh: There are so many American patents working in Japan, If Americans do not invest, it must be their Japanese counterparts that are working the American patents.

Shri Kashi Ram Gupta: In reply to my question, it was clearly mentioned that the largest investment of American capital is in the pharmaceutical industry. That they have said.

Mr. Shoichi Inouye: I would like to make it clear that so far as major pharmaceutical companies are concerned, there is almost no foreign investment, but they have many tie-ups of technological induction. In other words, Japanese Pharmaceutical companies pay for the patent; they are paying royalties to foreign companies but there is no direct investment from foreign companies.

Shri R. Ramanathan Chettiar: What is the difference?

Mr. Chairman: In reply to Shri Kashi Ram Gupta's question, you said that the investments are 50 : 50 and it is mostly in pharmaceutical industry.

Mr. Shoji Matsui: In pharmaceutical industry, there are some joint companies with United States or Germany or England and some of them are on 50 : 50 investment basis, but those are not big but rather small companies.

Mr. Chairman: May be, but you said there are about 21 per cent or so?

Shri Shyamnandan Mishra: That is based on the investment in the smaller ones.

Shri R. Ramanathan Chettiar: Mr. Chairman, that is Italian. You say that there is no foreign investment in the pharmaceutical industry in Japan. In the same breath you also say that it is only a technical tie-up. How do you reconcile these two statements? Earlier you have said that Du Ponds have an interest in Japan, the American Cyanamide Co. have an investment in Japan, a German pharmaceutical combine has got an interest in Japan and a British pharmaceutical concern also has got some interest in Japan. So, how do you say that there is no foreign investment worth speaking in the pharmaceutical industry? It would help us if you could tell us the royalty and the dividend etc. which you repatriate outside your country in regard to the pharmaceutical industry.

Mr. Shoichi Inouye: Under the technological induction contract, Japanese pharmaceutical companies have the so-called licence of patent rights owned by the foreign companies. In these cases the foreign companies do not have any share or stocks in Japanese companies, while the Japanese companies have to pay royalties according to the contract.

Shri R. Ramanathan Chettiar: How much?

Mr. Chairman: That has been given in detail in the memorandum.

Mr. Sohji Matsui: I would like to add one thing to avoid misunderstanding. In Japan, as you know, all those companies are composed of the public interest. At the stock market, everyone can buy the stocks. Even if a big American capitalist would like to buy the stocks of the Takedas, for instance, they can do so, and thereby the American com-

pany can occupy an even greater place in the pharmaceutical industry, but such a thing I have not seen.

Shri R. Ramanathan Chettiar: Are they forbidden?

Mr. Chairman: They are not forbidden. That is what he has said.

Mr. Shoji Matsui: Of course, now, there are Governmental restrictions on obtaining Japanese stocks. But, now, Japan is headed for liberalisation for foreign investment.

Shri V. M. Chordia: Kindly refer to Table No. 15 at page 10 of the Supplemental Materials. The fluctuation in the sale prices of the main pharmaceuticals is so much, and the prices have decreased so much that you yourself admit that in Japan, the price index of medicines for general consumers has shown a considerably decreasing trend of 15 to 30 per cent during 1959-64 as against the consumer price index of general commodities which showed an upward trent of 20 per cent. You have given some reasons also for this, but those reasons are not sufficient to explain how such a big decreese is possible. The high price, I believe, was due mainly to the monopolistic position held by the persons concerned due to patents or some other factors. It was only when they found some competitor entering the fild that they started reducing the prices. Due to competition and other factors, the price index which was 100 before had come down to 2.6. How will you safeguard the consumers' interest in such circumstances?

Mr. Shoji Matsui: A change of price take place due to many reasons. I would like to enumerate some of those reasons. One reason is over-production. If the production capacity exceeds the demand, then the produce-manufacturers would like to under-sell it even at a rate cheaper than their own cost. The second reason is that sometimes Government control the price, and due to the artifical control, the price goes down. The third reason is competition between competitors. I think that these three are not good causes for decrease in prices. I think that there are other sound reasons, some of which I would now like to enumerate. One of there is the downward price of raw material. We are importing many raw materials in Japan, and if the price of the raw materials goes down, then the price of the finished product also goes down. The second is the improvement of process due to the introduction of new technology, often resulting in the increase of the yield. That is also one of the reasons for the price going down. Another reason is the improvement of the quality. Improvement of quality means at the same time the going down of the price. Sometimes, a completely new process is invented; at that time also, the price goes down drastically. Another major reason is mass production. In the pharmaceutical industry, mass production is a very essential point for making the prices cheaper. Unfortunately in Japan there are so many manufacturers on the small scale, and that is one of the reasons why the price is sometimes high in Japan. Another factor is the interest on loans. In Japan, the interest on the borrowings from the bank is not so cheap as in the USA. In Japan, many companies have to borrow money from the bank. That is also one of the reasons which affect the prices of pharmaceuticals. Another factor is the income-tax rate in Japan. Corporate tax there is about 45 per cent altogether. Of course, many companies have been asking Government to reduce the rate of corporate tax. The tax rate is one of the reasons why our price is sometimes high.

These are the various reasons which affect the prices. So, it is very difficult to say exactly why the price is high or why the price is low.

Shri V. M. Chordia: You said Government also controls prices. Is there any law by which Government controls the prices, and on what basis do they decide the price?

Mr. Shoji Matsui: No, but reasonable price is usually set. Sometimes Government suggest us administratively.

Shri Bade: In your memorandum, at page 8 you have raised serious objection to sections 66 and 89 and you have said that revocation of a patent in the public interest should not be there. Section 66 is equivalent to section 25 of the old Patent law of 1911. From 1911 to 1966 can you quote a single instance where our democratic Government has acted arbitrarily?

Mr. Shoji Matsui: I realise that your present law includes this kind of provision, but I would like to suggest that this kind of provision will not be beneficial from the long range point of view. One reason is it is not clear when the patent will be revoked.

Shri Bade: I am coming to that. In section 89 there is a provision for revocation, but section 89 is controlled by section 90. Suppose a foreign firm fails to supply at a reasonable cost or fails to manufacture in India any patent medicine, should not Government revoke that patent?

Mr. Shoichi Inouye: In your new Patent Bill you have compulsory licence system. By making use of the system, you will be able to fulfil your emergent requirements. In our opinion, article 66 will not be necessary.

Shri Bade: In India, the condition is, May and Baker has taken 91 patents, and out of those 91 patents, they are only manufacturing two in India. We have to import the rest from foreign countries.

Mr. Shoichi Inouye: In case a patent or an invention is not adequately worked continuously for some period, you will be able to take action on compulsory licencing.

Shri Bade: Either compulsory licence or revocation is the only remedy.

Mr. Shoichi Inouye: If you take action on compulsory licencing, it will fulfil your requirements. According to my opinion, it will not be necessary to revoke the patent.

Shri Bade: In that case, you have to give four per cent royalty, according to that provision. Here, in the revocation, there is no question of royalty. You have to compensate it.

Mr. Shoichi Inouye: According to your opinion, it is necessary for you to revoke the patent, because, if you proceed towards compulsory licensing, you must pay royalty. But I think revocation without paying any compensation will damage the patentees too much.

Shri Bade: Please refer to page 12 of your memorandum; at line 10 you have said that "by way of this technological introduction, though Japanese pharmaceutical industries paid royalty, importation of foreign-made medicines was prevented to such an extent as saving foreign currency amounting to 99 million dollars in 1964". In what way have you prevented it? Is it by patent or by some other enactment?

Mr. Shoji Matsui: This statement has relevance to Table 22. In Japan it is not always necessary to import from foreign countries. Even in Takeda, we had the technological introduction from some other foreign countries, but still, it is a question of importing finished products from foreign countries. Sometimes, importation of the finished product will be cheaper than manufacturing it in Japan. But in many cases, manufacturing in Japan under technological introduction can save foreign money than in the case of importing. I have shown the figures here.

Shri Bade: Our difficulty is that 90 per cent of the pharmaceutical manufacturers are from foreign countries and they are exploiting our consumers and the poor people, by preventing patents and creating a monopoly. What should be the remedy except by passing this enactment?

Shri K. V. Venkatachalam: Can you give some examples of finished pharmaceuticals being imported?

Mr. Shoji Matsui: Librium.

Shri K. V. Venkatachalam: You are importing it from ROCHE, Switzerland. Not from Italy?

Shri Shoji Matsui: Not from Italy. Japan is not importing much pharmaceuticals from Italy, because in Italy, though some kinds of pharmaceuticals are cheap, in Italy itself the price is high. We import at a lower price. In Italy there is no patent protection for pharmaceuticals field. Japanese industry would like to refrain from importing some products from the country where no protection is given.

Shri Bade: What have you to say about the creating of monopolies tc the patentees?

Mr. Shoichi Inouye: If the patent is not worked continuously for some period, you can make use of compulsory licensing.

Shri R. P. Sinha: Your table 17 gives the number of foreign patents held by foreigners in Japan. What percentage of these foreign patents are worked in Japan?

Mr. Shoichi Inouye: In page 5 of my statement, I have said that the rate of registration of patents by foreign nationals is 70 per cent of the total patent applications by foreigners. Most of them are of a superior quality.

Mr. Chairman: How many of them are worked in your country?

Mr. Shoji Matsui: There is no trouble so far in Japan due to the non-working of the patents owned by foreign companies. Of course, we have to pay some royalties and the price becomes high. But that difficulty is offset by our import regulation system.

Shri P. R. Sinha: Have you got any idea of the percentage of royalty paid on the total cost or on the sales?

Mr. Shoji Matsui: Royalty rate is calculated on the manufacturer's selling price.

Shri A. T. Sarma: What was the foreign investment on the pharmaceutical products in Japan before the second World War and what is the investment at present?

Mr. Shoichi Inouye: I have figures concerning the number of applications for patents by foreign nationals before the war, but I regret I do not have any figures about foreign investment before the war.

Shri A. T. Sarma: Ir. your memorandum you have stated that by revising the patent law you were able to restrict importation of industrial products by foreign firms. In a similar way we are going to restrict importation of pharmaceutical products into our country by having these sections in our Bill. Do you appreciate our action?

Mr. Shoji Matsui: We have some restriction on importation of some pharmaceutical goods. We can manufacture the same in Japan, but the price is high compared to the price of imported goods. But it is important to protect the domestic industry. That is why we restrict the imports. But the price is high. That is against the welfare of the nation. That is remedied by the Health insurance system.

Shri M. R. Masani: Will you kindly turn to page 10 of the supplementary materials. Table 15 is very impressive in view of the sharp fall in prices of various products that you have listed. I would like to draw your attention to the first three pro-

ducts: penicillin, streptomycin and aureomycin all of which show a fall in price. But penicillin shows a very much sharper fall than the other two where the fall is more moderate. Is there any reason which you can give for this contrast or difference?

Mr. Shoji Matsui: Penicillin business was started just after the World War II by the order of America. At that time regarding penicillin there was no patent existing. Only the know-how was necessary for us. The United States gave the technical know-how to many many pharmaceutical industry. I think more than 50 companies started the business of manufacturing penicillin. Therefore, competition is one of the reasons why there is a very acute fall in the price. From a long range point of view that was a very unhappy position because due to severe competition more than 30 companies went bankrupt. Now the pharmaceutical industry considers that patent protection is very important for sound development of industry. Price competition might result in the appearance of inferior quality product on the market. Then the Welfare Ministry would like to introduce product patent system. One Managing Director of a leading Japanese Company said that the pharmaceutical industry needs product patent system.

Mr. Chairman: Am I right if I say that your patent law is modelled on the American law?

Mr. Shoichi Inouye: No. We set up a Government Council for deliberation of revision of the Industrial property right system. They studied carefully for about four years and reached some conclusions. The Japanese Government prepared a draft Bill based on the report of that Council and presented it to the Japanese Parliament. It was passed in 1958. The new law was put into effect in 1959.

Mr. Chairman: Could you give us a copy of your current patent law if you have got one?

Mr. Shoichi Inouye: Yes. There are my own personal notes written in this book and if you do not mind it, I will be very glad to give you this.

Mr. Shoji Matsui: If you need some more additional copies, I think, they will be available and we can send them on to you.

Shri R. Ramanathan Chettiar: Also, if you can send us information about foreign capital investments, that will be helpful.

Mr. Shoichi Inouye: We will send you both the information about foreign investments and the copies of the current Japanese patent law.

Mr. Chairman: Thank you very much.

Mr. Shoichi Inouye: On behalf of Mr. Matsui and myself, I would like to express again our deep appreciation for your close attention, patience and indulgence. I hope that what we said today will be of some benefit to your future deliberations at your esteemed Parliament. Thank you very much.

(*The witnesses then withdrew*).

(*The Committee then adjourned*).

Shri Bade: Our difficulty is that 90 per cent of the pharmaceutical manufacturers are from foreign countries and they are exploiting our consumers and the poor people, by preventing patents and creating a monopoly. What should be the remedy except by passing this enactment?

Shri K. V. Venkatachalam: Can you give some examples of finished pharmaceuticals being imported?

Mr. Shoji Matsui: Librium.

Shri K. V. Venkatachalam: You are importing it from ROCHE, Switzerland. Not from Italy?

Shri Shoji Matsui: Not from Italy. Japan is not importing much pharmaceuticals from Italy, because in Italy, though some kinds of pharmaceuticals are cheap, in Italy itself the price is high. We import at a lower price. In Italy there is no patent protection for pharmaceuticals field. Japanese industry would like to refrain from importing some products from the country where no protection is given.

Shri Bade: What have you to say about the creating of monopolies tc the patentees?

Mr. Shoichi Inouye: If the patent is not worked continuously for some period, you can make use of compulsory licensing.

Shri R. P. Sinha: Your table 17 gives the number of foreign patents held by foreigners in Japan. What percentage of these foreign patents are worked in Japan?

Mr. Shoichi Inouye: In page 5 of my statement, I have said that the rate of registration of patents by foreign nationals is 70 per cent of the total patent applications by foreigners. Most of them are of a superior quality.

Mr. Chairman: How many of them are worked in your country?

Mr. Shoji Matsui: There is no trouble so far in Japan due to the non-working of the patents owned by foreign companies. Of course, we have to pay some royalties and the price becomes high. But that difficulty is offset by our import regulation system.

Shri P. R. Sinha: Have you got any idea of the percentage of royalty paid on the total cost or on the sales?

Mr. Shoji Matsui: Royalty rate is calculated on the manufacturer's selling price.

Shri A. T. Sarma: What was the foreign investment on the pharmaceutical products in Japan before the second World War and what is the investment at present?

Mr. Shoichi Inouye: I have figures concerning the number of applications for patents by foreign nationals before the war, but I regret I do not have any figures about foreign investment before the war.

Shri A. T. Sarma: In your memorandum you have stated that by revising the patent law you were able to restrict importation of industrial products by foreign firms. In a similar way we are going to restrict importation of pharmaceutical products into our country by having these sections in our Bill. Do you appreciate our action?

Mr. Shoji Matsui: We have some restriction on importation of some pharmaceutical goods. We can manufacture the same in Japan, but the price is high compared to the price of imported goods. But it is important to protect the domestic industry. That is why we restrict the imports. But the price is high. That is against the welfare of the nation. That is remedied by the Health insurance system.

Shri M. R. Masani: Will you kindly turn to page 10 of the supplementary materials. Table 15 is very impressive in view of the sharp fall in prices of various products that you have listed. I would like to draw your attention to the first three pro-

ducts: penicillin, streptomycin and aureomycin all of which show a fall in price. But penicillin shows a very much sharper fall than the other two where the fall is more moderate. Is there any reason which you can give for this contrast or difference?

Mr. Shoji Matsui: Penicillin business was started just after the World War II by the order of America. At that time regarding penicillin there was no patent existing. Only the know-how was necessary for us. The United States gave the technical know-how to many many pharmaceutical industry. I think more than 50 companies started the business of manufacturing penicillin. Therefore, competition is one of the reasons why there is a very acute fall in the price. From a long range point of view that was a very unhappy position because due to severe competition more than 30 companies went bankrupt. Now the pharmaceutical industry considers that patent protection is very important for sound development of industry. Price competition might result in the appearance of inferior quality product on the market. Then the Welfare Ministry would like to introduce product patent system. One Managing Director of a leading Japanese Company said that the pharmaceutical industry needs product patent system.

Mr. Chairman: Am I right if I say that your patent law is modelled on the American law?

Mr. Shoichi Inouye: No. We set up a Government Council for deliberation of revision of the Industrial property right system. They studied carefully for about four years and reached some conclusions. The Japanese Government prepared a draft Bill based on the report of that Council and presented it to the Japanese Parliament. It was passed in 1958. The new law was put into effect in 1959.

Mr. Chairman: Could you give us a copy of your current patent law if you have got one?

Mr. Shoichi Inouye: Yes. There are my own personal notes written in this book and if you do not mind it, I will be very glad to give you this.

Mr. Shoji Matsui: If you need some more additional copies, I think, they will be available and we can send them on to you.

Shri R. Ramanathan Chettiar: Also, if you can send us information about foreign capital investments, that will be helpful.

Mr. Shoichi Inouye: We will send you both the information about foreign investments and the copies of the current Japanese patent law.

Mr. Chairman: Thank you very much.

Mr. Shoichi Inouye: On behalf of Mr. Matsui and myself, I would like to express again our deep appreciation for your close attention, patience and indulgence. I hope that what we said today will be of some benefit to your future deliberations at your esteemed Parliament. Thank you very much.

(The witnesses then withdrew).

(The Committee then adjourned).

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Wednesday, the 6th July, 1966 *at* 09.30 *hours.*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMAN

Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. The Indian Merchants Chamber, Bombay.

Spokesmen:

1. Dr. R. C. Cooper—*Vice-President.*
2. Shri P. A. Narielwala, *Member.*
3. Shri C. L. Gheevala, *Secretary.*

II. Trade Marks Owners Association of India.

Spokesmen:

1. Shri S. H. Gursahani, *Chairman.*
2. Shri R. A. Shah, *Solicitor.*
3. Shri C. K. R. Rao, *Secretary.*

I. Indian Merchants Chamber, Bombay

Spokesmen:

1. Dr. R. C. Cooper—*Vice-President.*
2. Shri P. A Narielwala—*Member.*
3. Shri C. L. Gheevala—*Secretary.*

The witnesses were called in and they took their seats)

Mr. Chairman: Whatever evidence you give will be published, printed and laid down on the Table of the House and distributed to the Members. Even if you want some portion of it to be kept confidential that will also be circulated to the Members. We have your Memorandum and it has been distributed to all the Members. If you want to add anything you may kindly do so in as short a time as possible.

Dr. R. C. Cooper: Mr. Chairman. at the outset I must say the Committee of the Indian Merchants Chamber is very grantful to you and the members of this Committee for having afforded us this opportunity to appear before you and personally convey to you our views and also emphasise some of the points which we consider more important in our memorandum. As the written memorandum has been circulated I would not like to take the time of the Committee by going over all these matters once again and to pin point the few important issues.

Now the first clause with which we like to deal is clause 53 which deals with the term of the patent. As against the existing period of 16 years, with a provision for extending the period up to 10 years, it is now sought to be provided that in all normal

cases the period will be 14 years but in cases of food, drugs, medicines it will be only 10 years. Our first submission is that there are no very special reasons why this discrimination should be made and we would like to have a uniform period of 14 years for all these items. But if for any special reason the Committee feels that in respect of these items the period should be short; then having regard to special factors there should be provision for extending the period of 10 years by a period not exceeding 4 years so that in exceptional cases the period will be uniform 14 years. The second submission which we would like to make on this clause is that it should be provided in the Bill that the time limit should run uniformly from the time of filling and sealing the patent because our experience is in a large number of cases a period 18 months to 20 months lapses between the date of first application and by the time the details are submitted and the final sealing of the patent. We would like a uniform period running from the date of sealing of the patent in all cases.

The second point which I would like to emphasise is clauses 86 and 87 which deal with the endorsement of the words 'Licences of right'. Here it is provided that in respect of patents for articles of food, medicine or drug, these words would be deemed to be endorsed automatically from the date of commencement of the Act whereas in the case of other articles it can happen only after the expiry of three years and that too if it is proved that there is no non-satisfaction of reasonable requirement of the public. Hereagain we feel there is not any special reason for making a distinction between this particular category of articles and the other inventions and there should be a uniform policy regarding the licences of right, namely, in every case it should be after 3 years and if the special requirement of non-satisfaction is made out any person can apply for licence. Now, he may not be financially in a position to exploit the patent or he may not have an efficient machinery. So we feel wherever licences are granted certain conditions should be laid down in the Act. A certain test should be laid down, certain qualifications should be laid down regarding the financial ability of the person, the technical skil of the person who applies for the licence.

Mr. Chairman: Do you think the Controller will automatically grant the licence without looking into all these various factors.

Dr. R. C. Cooper: Sir, we feel if this test is specially laid down in the Act the Controller will be bound to. We would like it to be spelt out.

The next thing which I would like to deal with is clause 64 of the Bill. Now, Sir, in this clause it is provided that importation into India of a product made abroad by a patented process would constitute knowledge or use in India of the invention on the date of importation and would be a ground on which a patent could be revoked by the High Court on the petition of any person or by the Central Government. Now, Sir, my submission is that before a product under a patented process could be manufactured in this country, it would be necessary to have market and clinical tests as to the usefulness of the product and for this purpose, a token importation will require to be made. Hence where the product is imported for the purpose of reasonable trial or experiment only, such importation should not constitute knowledge or use in India.

Sir, the next clause which I would like to deal with is clause 2(h) which defines 'Government Undertaking' as including the Council of Scientific and Industrial Research and or any University. Our submission is that this definition of the term 'Government Undertaking' is too wide and statutory bodies like Universities and other bodies like CSIR should be excluded.

This is the one suggestion we would like to make and the other suggestion is where even Government Undertaking exploits the patents or imports a patented article for the purpose of commercial exploitation there should be some provision for payment of compensation. It is not there in the Bill. Even under some circumstances the Government may permit an outsider, for certain reasons, to exploit this and the compensation has to be provided for.

The next clause with which I would like to deal is Clause 116. Since a patent constitutes an intangible property every decision of the executive affecting such property should be subject to revision or appeal by either a judicial or quasi-judicial body. We have, therefore, suggested that in respect of such orders or decisions for which no appeal has been provided to the High Court, an appeal should lie to a statutory body like the Copyright Board to be presided over by a High Court or a Supreme Court judge.

The last point with which I would like to deal with is Section 21 of the existing Act in which it is provided that while designs will continue to be binding on Government, patents will not be binding on Government. It can be provided that it will continue to be binding on the Government. But the reading of the new sub-section, which is sought to be provided, would convey the impression that it will not be binding on the Government as far as patents are concerned. We would like to say that a uniform practice which prevailed in the past regarding patents and designs should continue to prevail even in the present Bill.

These are my broad submissions. I would be clarifying any points which the Committee may like to put.

Shri Kashi Ram Gupta: Does the Indian Merchants Chamber contain only merchants as members, or does it contain members of other industries also?

Dr. R. C. Cooper: It has very large membership of industries inclusive of drugs.

Shri Kashi Ram Gupta: But you have said nothing about the period of patents of other industries. And the clauses that govern the Drugs industry mainly have been explained.

Dr. R. C. Cooper: In our Memorandum, we have explained everything. Here I have made only some broad points. I thought I will be saving time.

Shri Kashi Ram Gupta: This is the Memorandum, that is, from the Indian Merchants Chamber, dated December 20th. Is it a detailed Memorandum? The clauses here mostly refer to Drugs industry. Therefore, I had raised this point

Dr. R. C. Cooper: I may clarify that the basic stand of the Indian Merchants Chamber is that a uniform practice should be followed in respect of all types of inventions. And since the Bill itself makes discrimination between the two, we have emphasized that we are against the necessity of making such discrimination.

Shri Kashi Ram Gupta: An important point is this. You have just mentioned that so far as drugs are concerned, four years should be given for certain items if it is thought desireable by the Government. It means you yourself are agreeable to some discrimination.

Dr. R. C. Cooper: No, Sir. In the Memorandum we have said that we are unable to understand the reasons why the Government want to make discrimination. Our basic stand is that there should be a uniform period for every type of industry. That is our alternative suggestion.

Mr. Chairman: That alternative suggestion means that you are agreeable to some sort of discrimination.

Dr. R. C. Cooper: If the Government has any vaild reasons for doing so.

Mr. Chairman: Such a distinction is made in other countries. You know that. Then why do you object to this here?

Dr. R. C. Cooper: We find that conditions in India are fundamentally different. For instance, particularly in respect of medicines, we feel that the period of three years will be far too low and it will come in the way of people making scientific inventions; and there can be no proper exploitation of these, because the period is too low. And having regard to the infant stage of industrialization in this country we feel that at least for the time being this distinction is not called for.

Shri P. A. Narielwala: I would like to submit that the position is this. If you want to accept a foreign patent in India—in respect of a drug or anything else—it takes considerable time before, first of all, getting the approval of the Government for a particular industry to be set up with that patent. There are cases and cases, particularly during the last three years, where applications for evolving new processes or new patents have been before the Government for 33 months and 36 months, and no decision has been taken. Now, Sir, you just think of them first. A patent is registered in India, it should be examined and tested clinically before even the Drug Controller would approve of the drug being introduced in India. If a manufacturer wants to manufacture it in India, he makes an application to the Government, which sometimes takes, as I said, up to three years for the Government to decide. You see what is left out of that period. The period for which a particular patent could be accepted in India would be three years. If a manufacturer would wish to accept it, his property rights must be protected. Therefore, we have suggested that the period should be 14 years. If Government thinks that ten years is adequate, certainly there is a case for extension for another four years.

If a product made abroad is to be duplicated here, it may run into snags as a result of clinical conditions or as a result of our technical condition. A particular plant may be suitable in one country, but it may not be suitable in India.

Mr. Chairman: He has also got the right to import and sell it here before he establishes a factory.

Shri P. A. Narielwala: To keep importing is of no consequence.

May I make one more submission? Apart from the foreign patents, I would like the Committee to consider what damage this particular clause will inflict upon Indian patentees? Sir, our scientists are now beginning to produce results. We spend money in our national laboratories. Indian scientists are able to produce goods. Some of them are of patentable nature. Now, Sir, if you are going to impose a limitation on your patents, what is the just possibility of my being able to do this? I give you one more concrete example of a patent with which I am concerned, produced by our Mysore laboratory. I signed an agreement on 15th August, 1960. Today is nearly the 15th August 1966 and we have not yet seen that product because it has taken us years and years to design the plant in collaboration with that laboratory. It is really disastrous for our scientists because at this rate in 10 years time what benefit the Indian scientists could get out of it?

I would strongly urge that this Committee do consider that in this particular matter of food and pharmaceuticals, please do not discriminate. These are new products. And if we wish to see our own scientists develop themselves into really first-class producers of goods and patents, they must be protected against foreign patents.

Shri Kashi Ram Gupta: Are you aware of the fact that a large number

of scientists in this country are of the view that drug patents should be even for lesser period than ten years?

Shri P. A. Narielwala: I would say there are not a large number of scientists. I was present at a conference in Delhi only last January or February, known as Scientists and Industrialists Meeting. I was specially invited by CSIR to take part in the proceedings, and when I made this submission, I got enormous applause, and the scientists asked me to press this point because their position was going to be extremely difficult if they were going to be subjected to this kind of limitation which does not exist anywhere else in the world.

Shri Kashi Ram Gupta: In Bombay there is the Haffkine Institute and Mr. Abraham Patani on behalf of another institute who is going to give evidence. They hold a different view.

Shri P. A. Narielwala: I am quite aware that there are scientists who hold a different view.

Shri Kashi Ram Gupta: How are the two views to be reconciled?

Dr. R. C. Cooper: We are aware of only one isolated case, of a doctor from a Government hospital who has written an article on this subject and made out certain submissions, but against this one solitary case we are aware that there is a very large body of Indian scientists who feel that the Bill in its present form will do great harm to this country's young scientists.

Shri Kashi Ram Gupta: There are two views in the country, one that the period of patent should be from the date of application, and the other that it should be from the date of the sealing of the patent. The Model Law of BIRPI provides that if a country takes to the date of sealing of the patent, the period can be 10 years. They, of course, say 10 years minimum; it means they are agreeable to 10 years to a very large extent.

Shri P. A. Narielwala: The same body has also said at another place that the period of patent should be 20 years, though they have also conceded that if the Government of the developing country feels it necessary it may be 10 years minimum from the date of sealing. That is the submission which our Chamber has also made. If the Committee does not agree to a uniform period of 14 years, then at least 10 years from the date of sealing should be provided with the proviso that if a particular patent requires to be extended, it may be extended by a further four years.

Shri Kashi Ram Gupta: About clauses 86 and 87 you have referred to optical glass, semi-conductors etc. Are you in favour of including these as drugs or you want that these should not be included?

Shri P. A. Narielwala: We certainly do not want any discrimination, and I cannot see for myself how they come under the provision of food and pharmaceuticals. It is something which I just do not understand. May I submit that it should read clauses 87 and 88 at page 7 of our memorandum, and not 86 and 87? It is a mistake.

Shri Kashi Ram Gupta: You have said that in the interests of the scientists of the country, there should be a uniform period of 14 years, but scientists are mostly working in the research laboratories of companies who set aside a certain percentage of their profits for research. It is counted as revenue expenditure and is allowed by income-tax authorities. So, to say that scientists have to be protected does not relate to facts because they are paid by the companies regularly.

Dr. R. C. Cooper: In a developing country like ours where there is abundance of talent available, it will not be correct to say that all kinds of scientific investigation should be through companies only. If the Bill is changed according to our suggestions, it will give a chance to independent scientists to do their work and take

out patents which they can negotiate with others for sale.

Shri Kashi Ram Gupta: Organised research has to be in Government laboratories or undertakings with large resources. Scientists have also given evidence that individuals cannot do much.

Shri P. A. Narielwala: The amount of money Indian industry spends on research as compared to industrialised countries is merely a fleabite. Industries are being urged to form research laboratories or groups of their own, and CSIR has gone out of its way to say that they will meet 50 per cent of the cost of running of such groups, in order to develop research consciousness both in applied and fundamental research. Scientists in the national laboratories who obtain patents have to hand them over to the National Research Development Corporation, a 100 per cent Government owned institution, and the royalty from the patents is to be shared between the laboratory and the National Research Development Corporation, and the amount coming to the laboratory has to be shared between the scientist and the laboratory. So, the scientist does not get the major benefit.

Shri Kashi Ram Gupta: The present Act provides for 16 years, but the scientists in India have not been benefited much during all these years. What is the reason for that?

Shri P. A. Narielwala: Our national laboratories came into existence only after independence. The first was the National Physical Laboratory. In 1950-51, we got the National Chemical Laboratory. Research does not flow from the time you start. Sometimes it takes years: even five, seven or ten years before you hit upon an idea which is of any significant benefit for the development of science and industry. We must not judge the results. I am one of the members on the Board of the Council of Scientific and Industrial Research, and therefore I used to say particularly to the critics of our national laboratories, "Please give us time; we are working under a great handicap; we are hampered all along the way. Even if I get finance for the national laboratories, you cannot expect that because we spend so much money every year we should produce goods immediately through the process of patents."

Dr. C. B. Singh: I am glad to have your views. About money being spent on research, may I ask you what is the proportion, I mean percentage, on turnover of money spent by your Chamber on research?

Shri P. A. Narielwala: Practically nothing. We have only a research organisation for economic research on which we are spending something like Rs. 75,000 a year, in producing a study on economic problems confronting the country.

Dr. C. B. Singh: With this remark that you are spending practically nothing, what would you consider to be an adequate fund to be spent on research by your Chamber? I mean the laboratories and other concerns, whatever it may be What will be the percentage, that you would like them to spend for research, on their turnover?

Shri P. A. Narielwala: I can give my personal view. It is this: the industry should spend a minimum of one per cent of its turnover on research.

Dr. C. B. Singh: You know the amount of money that some other countries are spending on research: it is more than 10 per cent or at least five per cent of their turnover. Are you sure that one per cent will be enough here?

Shri P. A. Narielwala: I am talking of the average: I mean an industry, which is not necessarily pharmaceutical or the drug industry. I consider that in India, if we can spend even one per cent on the turnover for research, we will give it a tremendous boost.

Mr. Chairman: Could your Chamber do anything to discipline your members to spend 10 per cent?

Dr. R. C. Cooper: Of late, our Chamber has taken up this matter in right earnest, and one of the important things which we are emphasizing on our industrial members is that the industry has not taken sufficient advantage of the very liberal tax concessions which are provided for scientific research, and more and more use of these concessions which are now availab'e to the industries should be made. This is the plea which we have repeatedly made to them during the last six months.

Dr. C. B. Singh: I am glad of it. You know that the average Indian scientist is not inferior to anyone else, in other countries. You agree?

Dr. R. C. Cooper: Yes.

Dr. C. B. Singh: Then, what is the reason for hardly any real good work, good research work, being done in the national laboratories or universities in India? Having agreed that our scientists are as good as any other scientists elsewhere what is the reason that so far only one thing has been patented? What is the reason that only very litt'e has been done so far? Besides the lack of finance, is there any reason?

Shri P. A. Narielwala: I beg to differ from you. I consider that our national laboratories have produced very good work.

Dr. C. B. Singh: I do not agree.

Shri P. A. Narielwala: That is a matter of opinion. I would say that we have excellent scientists in our laboratories. If you look to each and every laboratory that is functioning, you will find that at the end of the year, they are unable to fill the vacancies by suitable scientists. The CSIR have asked me to sit on the Selection Board, and I have told the Selection Board and the Council that sometimes not one candidate is suitable for the particular job for which he has applied. So, the posts go on remaining vacant year after year.

Dr. C. B. Singh: You mean to say that suitable candidates are not available?

Shri P. A. Narielwala: Suitable candidates of the calibre for high-grade scientific work are not always available.

Dr. C. B. Singh: You know that more than 6,000 Indian scientists are working outside this country; they are doing better work outside.

Shri P. A. Narielwala: I do not know the number. I take your figure. There are various reasons for it. Maybe that there are not enough opportunities in India for good work.

Dr. C. B. Singh: What are the opportunities that are not available? It is not that our scientists are not there. They are there. If they are not getting the opportunity, why is it so?

Shri P. A. Narielwala: If there are certain Indian scientists who have specialised in missiles, and if we have no work done on missiles, how are they going to come and do the work here? Similarly, there are other physical sciences where we have not developed the work in our laboratories so as to proceed with research. Another reason is that the salaries and pay-scales that we offer to our scientists are totally inadequate.

Dr. C. B. Singh: The main reason to my mind is this: it appears to me and to a large number of Members of Parliament that the director or the man heading these big laboratories or the other people who happen to head these big laboratories—their appointment is open to doubt. We feel that as a result of that, the se'ection of suitable men and the consequent work suffers.

Shri Kashi Ram Gupta: This has nothing to do with patents.

Mr. Chairman: How can they give an opinion on that?

Dr. C. B. Singh: Now, if the period is extended due to circumstances which are put before the Government—say four years—will it serve your purpose? I mean the period from the time of acceptance.

Shri P. A. Narielwala: Yes.

Dr. C. B. Singh: In para 2, page 1 of your memorandum you have mentioned that the Bill has been brought forward with a view to ensure that patent rights are not worked to the detriment of the consumer or to the prejudice of the trade or industrial development of the country. Unfortunately, you have not mentioned anything about the scientists who have got patent rights.

Dr. R. C. Cooper: In the second paragraph we have said that in our opinion some of the provisions will come in the way of stimulating inventions by scientists and research workers of India and of encouraging the development and exploitation of new inventions for industrial progress. We feel that it will have a deleterious effect on both the sections: the inventors as well as the industry.

Shri M. L. Jadhav: In spite of the low cost of labour in India, the cost of production of pharmaceuticals is high, compared to some of the other nations. Can you suggest ways as to how we can reduce the cost?

Shri P. A. Narielwala: Let us first be clear about one thing. The conditions in India are very different from those abroad. In India if you want a material, you cannot get it readily; you will have certain material or ingredient which has to be imported. If you look at the import tariff schedules, you will be surprised that even the necessary basic ingrediants have rates of duties which go up from 47 to 75 per cent or more. Even in respect of capital goods, a highly developed country like Japan, which has built itself up in the last 20 years as one of the biggest industrial countries of the world, the Japanese delegation which visited India in the beginning of this year told us in categorical terms that in Japan no import duty is levied on capital goods or raw materials. Here on capital goods costing Rs. 1,000, the duty comes to 40 per cent and the cost becomes Rs. 1400. The cost of depreciation also is higher and these would be reflected in the cost of the product. Fantastic duties are levied on the raw materials. Moreover, it is not always correct that Indian labour is cheap. It is a fallacy.

Shri M. L. Jadhav: There is a section of people which thinks that there should be no patent law at all. What is your view?

Shri P. A. Narielwala: We do not support it. That would be disastrous. Even countries which had no patent law till now are now veering round to the view that they should have patent laws to protect their own scientists and their own products. The Soviet Union which has had no patent law has now realised that they should have patent law to exploit the patentable products they are producing and to sell them abroad, and it has decided to join the International Union of Patents.

Shri M. L. Jadhav: Do you agree that the patentees are selling their goods at a higher rate in India as compared to the international price?

Shri P. A. Narielwala: I am not aware of that particular thing. I know a number of patented products sold in India by the manufacturers and I have seen the collaboration agreements. There is a provision that the imported products shall be sold at the international price and that we would get the most favoured nation treatment, if I may say so. That has been the practice certainly in the industries with which I am concerned. May be it is not so somewhere else.

Shri Peter Alvares: I would like to refer you to the clause on licence of

right. Licences of right are given in circumstances where a particular patent is not worked in India. In view of the fact that Justice Ayyangar's report says that the patent law must be cast in a particular national economy, this prevents abuse whereby a patent is not worked here, but the entire product is imported from abroad, lock stock and barrel and it is only labelled here. So, Indian scientists have no opportunity of getting the know-how and technological developments do not take place. In such circumstances, a licence of right is granted so that an Indian applicant may be able to work out the entire patent in India. I thought this provision should have your sympathy.

Shri P. A. Narielwala: We have not opposed the grant of compulsory licensing. We have only said, give him three years' time and if he does not do it, you can go ahead. Even in the existing patent law there is a provision for compulsory licensing. Would the Controller of Patents tell us how many parties have come forward and said, we want compulsory licence to be given for exploiting those patents? Is it in the national economy to produce a product which is imported in very small quantities and to manufacture it at three or four times its imported cost simply for the pleasure of having the product manufactured in India? We as manufacturers realise that we should manufacture a product when there is sufficient need for that product. When a product is manufactured in bulk in one country, to produce it here in small quantities means we shall lose the benefit of the economy of scale, and our costs will be invariably higher. We, as manufacturers, would be reluctant to do so.

Shri Peter Alvares: The conclusion would then be that in most cases the cost of production in India is high and so we should continue importing the products.

Shri P. A. Narielwala: Our industrial development in the last 10 years is a refutation of that theory. There are demands building up in this country for all kinds of products and the Indian manufacturers are ready to risk their capital when there is a possibility of producing those goods on an economic basis.

Shri Dalpat Singh: At page 3 of your memorandum you have said in regard to clause 48 that universities and scientific research institutions should not be included under the definition "Government Undertaking". Why?

Dr. R. C. Cooper: We are going by the definition of Government Undertaking and we feel that universities and bodies like the CSIR being statutory bodies having a separate identity should not be included.

Shri P. A. Narielwala: Some of the CSIR laboratories produce goods for sale. You will understand that if they are allowed to take over a patent without paying any compensation, it would be an erosion into the property rights of a patentee.

Shri Dalpat Singh: What objection do you have for including bodies doing research?

Shri P. A. Narielwala: For research we do not object. We only say that a university should not be included as a Government Undertaking. A Government Undertaking would be a factory like the one at Pimpri. I am surprised that universities have not protested against their being called Government Undertakings.

Mr. Chairman: It is only for research that they want these things.

Shri P. A. Narielwala: For research, we do not object. We have said nothing against national laboratories for doing research.

Shri A. T. Sarma: Foreign witnesses say that if this Bill is passed, foreigners would not invest their money here and would not open factories in India. Is it correct?

Dr. R. C. Cooper: As far as I have been able to understand, the argument

of these people is that against the profits which are made here they are incurring exceedingly large expenditure on research by their parent organisation and since the benefit of this research is available to India a certain proportion of that research expenditure has to be allocated to India. This is the answer which they are giving again and again to the charge made against them of their making huge profits and the consequent necessity of amending the patent law.

Shri A. T. Sarma: May I know whether the non-investment of foreign capital will adversely affect our research and industrial development?

Dr. R. C. Cooper: To a certain extent, it may, till such time as the indigenous research has developed to that extent.

Shri A. T. Sarma: The foreign companies have stated that the Indian Parliament is taking a backward step by proceeding with this enactment. Do you agree with that view?

Dr. R. C. Cooper: We also agree that if the Bill is passed in its present form it may be a retrograde step in the sense that Indian Industry and Indian scientist will suffer.

श्री चौरड़िया : आपने कहा है कि एप्लीकेशंज के डिसपोजल में काफी समय लग जाता है और यह जो सीलिंग पीरियड है, इसको कम किया जाए। इसको कम करने के क्या आप कोई सुझाव दे सकते हैं ?

Dr. R. C. Cooper: These are the usual procedural delays of Government departments. If the delays could be otherwise independently curtailed, then automatically the period of ceiling will be earlier and it will start from an earlier date. It is entirely a matter of administration and perhaps the Administrative Commission will have to look into it.

श्री चौरड़िया : एडमिनिस्ट्रेशन वाले तो नियमों के अनुसार काम करते हैं। ऐसी स्थिति में क्या आप कुछ नियमों में भी फर्क करना चाहते हैं ताकि नियमों के अन्तर्गत काम करते रह कर भी काम जल्दी से हो सके ?

Dr. R. C. Cooper: I do not know to what extent it will be possible to provide that there shou'd be a definite time limit beyond which an application cannot be kept pending, because I do agree that there will be practical difficulties from both ends. In certain circumstances, for valid reasons, there may be delay. But if it is from the date of ceiling I feel it will be fair to the industry.

श्री चौरड़िया : आप ने कहा है कि पेटेंट का जो पीरियड है वह पर्याप्त होना चाहिये चौदह साल या सोलह साल। परन्तु क्या आपको यह भी पता है कि विदेशी कम्पनियों ने जो पेटेंट एक्वायर कर रखे हैं उनको इंटरनैशनल मार्किट प्राइस सामग्री कम है और हमारे यहां पर वह ज्यादा है ? मैं आप उदाहरण देता हूं। टोलबूटेमाइड हेक्सट को यूरोपियन कंट्रीज में ट्रेड प्राइस 1.85 डालर है जबकि हमारे यहां पर 3.57 है। इसी प्रकार से क्लोरपरोफिनपेमाइड को इटली में प्राइस 1.41 डालर है जबकि हमारे यहां पर चार डालर है। पेटेंट की वजह से ही हो सकता है कि वे ज्यादा हम से लेते हों। इसको रोकने के लिए आपका क्या सुझाव है ?

Shri C. L. Gheevala: May I make a submission? The prices of products in international markets where there is piracy of patents cannot be controlled. Italy is one country where there has been no patent law where a large number of products have been produced and sold. It is on record in Italian Parliament itself that the products sold are sub-standard in some cases and the internal price of that product in Italy is as high as the price of an imported product but for purposes of exports they are selling at very low prices and that in many countries the products from Italy are

now banned. What is more significant is, in the absence of patent laws in Italy, their scientists have gone out of Italy to register their patents. Is it not a national loss that the patent benefits which should flow into Italy go to the Italian scientists who remain outside Italy, where they have accumulated foreign exchange by exploitation of the patents? Those patents are registered all over the country except Italy. I think we should avoid that kind of situation in India. Even Italy has now drafted a Patent Bill which is now before the Italian Parliament to come into line with the patent laws of other countries.

श्री चौरड़िया : आपने अपने मैमोरेंडम में सुझाव दिया है कि पेटेंट्स का जो बंधन है वह शासन पर भी लागू हो । हमारे यहां प्रजातंत्र है । प्रजातंत्रीय सरकार जनता के अहित में काम करे ऐसी कल्पना नहीं की जा सकती है । ऐसी स्थिति में कौन से विशेष कारण हैं जिनकी वजह से आप यह सुझाव देते हैं कि शासन पर भी पेटेंट के नियम लागू होने चाहियें ?

Dr. R. C. Cooper: Since today the Government is operating in the public sector, we feel that whenever Government operates in industry or business it should be in the same terms as the private sector. For instance, there are at least three drugs we are aware of which are being produced by Government factories, which are all unpatented articles where the prevailing market price in different countries is less than Rs. 50. Those drugs are being sold by Government factories at more than Rs. 4,000.

Shri C. L. Gheevala: May I also point out another instance? In Pimpri they have invented a fungicide which they are now trying to exploit in foreign countries. You will be surprised to know that they have asked for a royalty of 7½ per cent for allowing this product to be exploited, whereas the present Bill provides only for 4 per cent. They have run into heavy weather because of this provision in the Bill. The foreigner who wanted to exploit this product turned round and said: when your own Government fixes 4 per cent, how could you ask for 7½ per cent. So, we must be prepared to face these repercussions. Then we have to consider how the Indian scientists and industrialists will suffer because of the provisions of the Bill. We are anxious to protect our own Indian interests. We are not interested in protecting foreign patents or foreigners. We want to protect our own scientists, scientific workers and industries so that they can produce patentable products.

श्री चौरड़िया : आपने अपने उत्तर के दौरान में रूस का उदाहरण दिया है और कहा है कि वहां पर भी कानून बना कर उनके अधिकारों की रक्षा करना चाहते हैं, उनके अधिकारों को सुरक्षित रखना चाहते हैं । आप जानते ही हैं कि पहले वहां के लोगों ने कोई पेटेंट का कानून नहीं रखा था । पहले पहल पेटेंटिड प्रोडक्ट्स का रूस ने निर्माण किया तो नकल उनकी उसने की । बाद में कुछ संशोधन किये । आज कई वर्षों के बाद वह इस स्थिति में आया है कि वह स्वयं नई खोज करके नए नए प्रोडक्ट्स पैदा कर सके । ऐसी स्थिति में भारत में साइंटिस्टों को भी इस बात का अवसर क्यों न मिले कि पहले तो वे दूसरों की नकल करके कुछ सीखें और फिर अपनी अकल लगा कर संशोधन करके नए उत्पादन करें । इसमें आपको क्या आपत्ति है ?

Dr. R. C. Cooper: The fundamental question which has to be realised is that the pattern of Soviet economy is completely different from the pattern of Indian economy. We are not operating in a closed economy. So, what may be good for Russia may not necessarily be good for India. It is my firm conviction that it will be very

harmful if no patent law existed in this country.

Shri C. L. Gheevala: May I supplement this observation by saying that in some of the industries, particularly the pharmaceutical industry, we must realise the fact that our scientists are of the view that they are as good as Russian scientists. For instance, in the case of the anti-biotic plant at Haridwar with Soviet collaboration the knowledge and know-how they have offered to give us is very inferior to what we ourselves have developed and, in fact, we have accepted this for political reasons. We are hoping, our scientists are looking forward for the day, when they can tell Soviet Union that their services are no longer required and that we will produce those products our own and improve upon them because we know how we can improve with our own knowledge of the subject.

Shri R Ramanathan Chettiar: On page 9 of your memorandum you have stated:

> "My Committee suggest that there should be no ceiling on the royalty payable and the amount of royalty be determined in each case with reference to the facts of the case and the Controller may be empowered to fix the royalty after taking into account the various circumstances of the case."

You suggest that there should be no ceiling. In the present Bill we have put a ceiling of 4 per cent. You have given the example of one collaborator asking for 7½ per cent and a lot of hullabaloo about it. Should we agree to exploitation by foreign interests in the field of drugs and pharmaceuticals in this country?

Let me quote an instance here. You would have seen the November, 1964 Bulletin of the Reserve Bank of India. In that it is mentioned that in 1962-63, the total investment of group of foreign firms in the pharmaceutical and drug industry was of the order of Rs. 14 crores and that they have taken by way of dividend, etc. about Rs. 2 crores and by way of royalty Rs. 5 crores. That means 50 per cent of the total investment has been repatriated to their countries in one year. So, if we accept this and have no ceiling, that means it will lead to further exploitation of our country. Already, our country is a very poor country and there is exploitation by drug manufacturers and distributors in respect of life-saving drugs to the detriment of our people. After all, as you would rightly accept, the life-saving drugs and other medicines should be within the reach of poorer classes of people. Today, some of the life-saving drugs are not able to find its way to the poorer homes. Don't you think this will act against that objective?

Dr. R. C. Cooper: Let me clear out some of the misunderstandings in this matter. The first thing which I would like to point out is that we are ourselves trying to collect data on these royalties and we have found that of late the actual royalty percentages have very considerably come down and today they are very much nearer the figure of 4 or 5 per cent which is sought to be provided in the Bill. We are, however, asking for a certain amount of flexibility only because there may be some exceptional items where this kind of rigidity may come in the way. Our enquiries reveal that mostly the pattern of royalties is very near the figure which the Government is contemplating. We are suggesting the removal of the ceiling only for the purpose of ensuring flexibility.

The other misunderstanding which I would like to clear is this. The Reserve Bank's figures are gross figures of royalties which accrue to the foreigners. We have got to appreciate that the tax rate which operates here varies from 55 to 70 per cent with the result that a considerable amount of this revenue comes to the Government of India. It is only the net amount, after the payment of tax which varies from 55 to 70 per cent, that the foreigner takes away. I am myself con-

cerned with many of the pharmaceutical concerns as an auditor and I know the net amount which they are able to take away from here after paying the tax.

Shri R. Ramanathan Chettiar: You are forgetting that we are having double tax relief in some of the countries to which this money is repatriated.

Dr. R. C. Cooper: The principle is that since a company is a non-resident company here, the double taxation benefit, in the absence of agreements in most countries is given at the other end. That is at the expense of the foreign Government and not at the expense of our Government. Even in countries like U.K. and U.S.A. we have not got the double tax relief. In the absence of agreement, the double tax relief has to be given to the company which is resident.

Shri R. Ramanathan Chettiar: The amount of Rs. 2 crores is the dividend. How can it be a gross amount? It will be after payment of the taxes here. No dividend is paid before taxes are paid to the Government.

Shri C. L. Gheevala: When a company declares a dividend, the dividend, first of all, is subjected, at the hands of the receiver, to the repayment of 20 or 22 per cent. If the dividend is Rs. 10, actually I will get only Rs. 8 or 7, whatever it may be. The foreigner, having got that, has then to pay the income-tax on the dividend that he has received which, as Dr. Cooper pointed out, varies from 55 to 70 per cent. Out of the amount of Rs. 8 which the foreigner has received as the dividend, actually he can only remit Rs. 2.50 p. or Rs. 3.

Shri R. Ramanathan Chettiar: Even then, for an investment of Rs. 14 crores the dividend is Rs. 2 crores.

Shri C. L. Gheevala: May I make one other submission? In a free economy, I can understand some kind of a ceiling being provided. But in our country, where we have a planned economy and particularly where there is foreign collaboration and foreign exchange is to be remitted, we have to go to the Government of India and the Reserve Bank for the approval of the terms. What purpose is served by putting a ceiling? I may tell you that the Government of India's Technical Development Department Wing which is competent to assess the merits of a particular produce have themselves in some cases suggested a lower royalty of 2 or 3 per cent and the foreigner has accepted it if he knows that the product is likely to be fully exploited.

Another thing which I would like to mention is that in many of the pharmaceutical companies with foreign collaboration, you will notice that the majority capital is with them, either 50 per cent or 60 per cent or even 70 per cent. In the latest issue of Pfizer which was made public the other day, you will notice that 70 per cent of the capital is still held by foreigners. What purpose does it serve by putting a ceiling? We are only creating an unnecessary apprehension in the mind of anybody who is going to use the patent. He is going to be governed by our own laws and by our own assessment of the value of a particular product and whether it requires any royalty or it does not require any royalty. What purpose does it serve by putting a ceiling?

Shri R. Ramanathan Chettiar: I can understand your taking exception to the low rate of 4 per cent.

Dr. R. C. Cooper: We are not taking exception to the low rate of 4 per cent. We concede and are aware of a large number of agreements in the pharmaceutical field itself where the percentage is less, that is, 3 or 2 per cent. We are against a rigid ceiling which may come in the way of genuine cases because of this statutory limitation. That is why we would like to have flexibility.

Then, the figure of Rs. 2 crores of the Reserve Bank does not take into account the large amount of expenditure on research, the overheads, etc., incurred at the other end which is rightly allocable against the royalty payment. Our income-tax laws have conceded that where a foreigner receives a royalty here, he is entitled to a proportionate relief for the expenditure on research, overheads, etc. incurred at the other end.

Shri C. L. Gheevala: Today, in our country, in certain fields, we are extremely ill-provided. I am not talking of the pharmaceutical industry. I am talking of the field of electronics. As you know, the Bhabha Committee has made a recommendation that in the next 10 years, there should be an investment of Rs. 150 crores if we wish to develop the electronics industry and put ourselves on the electronics map. This is a very highly specialised and highly technical field. It is quite conceivable that with the new developments of electronics, it may become necessary to pay even more than 4 per cent and go even upto 10 per cent.

Shri K. V. Venkatachalam: 4 per cent does not apply to any other area except the drugs industry.

Shri C. L. Gheevala: I am sorry. I did not realise this. Then, I will not pursue this.

Shri B. K. Das: You have discussed in your Memorandum the matter regarding payment of copensation for government use. For experimental research, including imparting of insctructions, you are agreeable that compensation may not be given and also in cases where there are emergincies involving the security of the country, you are aggreable that compensation may not be given. But do you not think that there are other grounds also on which compensation may not be paid, for instance, for government use in hospitals and other things, compensations may not be paid; government may make use of it for public welfare.

Shri P. A. Narielwala: The question is a very wide one. Are you thinking in terms of Central hospitals or State hospitals? We are continuously expanding our hospitals. Is it fair that government should have the right to manufacture a patented product without paying the owner the necessary compensation? What I am trying all along to explain and impress upon this Committee is that we are not trying to have two laws—one for foreign patentees and one for Indian patentees. Indian patentees would also suffer in this manner. I am trying to protect the Indian research worker, the Indian scientist. If he can manufacture this product and sell it to government departments or to hospitals, why should he be prevented from doing so? Government say, "we will exploit this patent and you have no right for any compensation." I think it is totally unfair that I should be asked to give the benefit of my knowledge to the State without any kind of compensation, to supply hundreds and thousands of hospitals in this country. We have ourselves stated that, in national emergencies and for Defence requirements——certain urgent requirements—we may make some exceptions, but to give a general blankets licence to government means that it will be utilised and fully exploited by government for all kinds of purposes even when it does not serve any national interest.

Shri B. K. Das: Government may also like to import, if necessity arises.

Shri P. A. Narielwala: The same principle arises. If it is a patented product, government imports it directly and not through the patent owner. If it is imported through the patent owner, he will naturally ask for some compensation. What you are trying to do is this: the Indian High Commission London,—Purchasing Mission—will buy the product in England and bring it here. I think it is unfair.

Shri B. K. Das: They were restricting it to particular cases.

Shri M. R. Masani: I have found the evidence most convincing and impressive and have, therefore, nothing to ask.

Shri V. B. Gandhi: In the first place I agree that there should be flexibility in the matter of rate of royalty payable. Perhaps the idea that Government had in mind in bringing in this measure with a fixed royalty was that, in private negotiations between foreign collaborators and Indian industrialists, sometimes a fixed royalty expressed in the Bill would help to keep them firm. Do you think that there is any truth in that?

Dr. H. C. Cooper: Wherever any foreigner is involved as a receipient of royalty, the agreement is subject to governmental sanction in any case and both the parties, according to government policy, are fairly clear in their minds as to what is permissible. So putting an additional ceiling in the Patent Act itself will not help because that is taken care of independently. On the contrary, it will create hardship in a few genuine cases.

Shri V. B. Gandhi: I have said that I agree with the principle of flexibility.

Dr. L. M. Singhvi: cannot esist the temptation of asking questions notwithstanding the fact that the evidence is very clear, concise and comprehensive.

I would like to konw in particular whether it would be more in consonance with the evidence tendered by the witnesses that "licences of right" should be abolished altogether.

Shri P. A. Narielwala: If you wish to abolish it, the business community would welcome it; the industrialists would welcome it.

Dr. L. M. Singhvi: It seems that certain suggestions made in respect of provisions relating to "licences of right" have been made only as a second string to the bow bocause the whole argument—and the tenor of the evidence— has been that "licences of right" should be merged into the larger category of compulsory licences, if there is any need, but "licences of right" as such as a distinct category should not be allowed to exist in this enactment. Is that the position?

Shri P. A. Narielwala: Yes; that is the correct position.

Dr. L. M. Singhvi: May I know whether it would be correct and fair to say that your Association generally agree with the recommendations of the Ayyangar Commission, particularly in respect of the term of the patent?

Dr. H. C. Cooper: We are broadly in agreement with most of the recommendations.

Dr. L. M. Singhvi: I would like to know whether the uniform term for all inventions is a useful thing or whether certain distinction should be made in respect of food, medicines and other things, mainly on the ground of interest of the community. If the opinion of the witnesses is that there should be uniform provision and no differentiation should be made, would they amplify the reasons that they have given?

Shri P. A. Narielwala: We think that there should be uniformity, whether it is pharmaceutical or food or any other patent. We have said that, in our opinion, a patent should be given for a period of 14 years. We have merely made this suggestion to the Committee and if the Committee does not approve of this suggestion, then we will put up an alternative—I may say here that it is only an alternative: allow the patent right for ten years after the sealing of the patent and then leave it to Government; give the Government to flexibility, the option, the provision to extend it for a fur-

ther period of 4 years. We are not suggesting the present provision where the patent is for 16 years and then there is provision for extending it by five years and then by another five years, so that the patent may run for 26 years. 26 years seem to us to be a long period. But 14 years in the conditions in which we operate in this country under a planned economy, does not seem to us to be too long.

Dr. L. M. Singhvi: Then you give us the maximum and the minimum periods taken in the registering a patent.

Shri P. A. Narielwala: Our information is that the minimum period is 18 months and the maximum period is two years.

Dr. L. M. Singhvi: In respect of Clause 112, which says that no injunction shall be granted against him, you have suggested that the word "shall" should be substituted by the word "may" so that the Court can go into the question and come to an impartial judicial decision. I do not find his consistent. Could you explain whether, as a matter of fact, the substitution of the word "shall" by "may" would necessarily enable the Court to go into the question and to come to an impartial judicial decision, as you say in the Memorandum? Because whether the Act says that no injunction may be granted against him or it says that no injunction shall be granted against him, both should be read exactly in the same manner.

Dr. H. C. Cooper: What we would like to see is that the authority of the Courts should not be taken away and our amendment is only to see that the authority of the court is restored.

Mr. Chairman: It has come to our notice that courts take very long time to dispose of cases. In such a case will you be satisfied with a special Tribunal competent to dispose of these cases.

Dr. H. C. Cooper: We have suggested a Tribunal for executive acts. But I am aware of at least one case in which we ourselves pleaded for Companies Tribunal under the Companies Act for certain things, and it should be presided by a High Court Judge. Now we find that the rate at which the Tribunal is disposing of cases is much slower than the Court of law.

Mr. Chairman: We may also prescribe a period for the disposal of cases.

Dr. H. C. Cooper: If some such machinery can be evolved and the period is shortened, we would very much welcome, but our experience is the contrary.

Dr. L. M. Singhvi: Clause 116 adumbrates two categories. In one case there shall be no appeal at all; in the other case, under certain specific sections, an appeal shall lie to the High Court. You have suggested that in the first category there should be an appeal to a statutory body like the Copyright Board. Would you rather not have a uniform provision in both the cases for an appeal to the High Court rather than create a bifurcation of jurisdiction—one the High Court and the other a Tribunal analogous to the Copyright Board?

Dr. H. C. Cooper: We have made this suggestion looking at from two viewpoints—one from executive matters and the other is from technical matters. Even if the matter went up to the High Court, there may be a necessity of having assessors appointed and the matter might be quite complicated. So we thought in such procedural and executive matters perhaps the Tribunal will be more helpful. Secondly, as the Chairman himself has said, there occurs delay in disposal of cases by courts.

Mr. Chairman: Suppose we give the right of appeal only on points of law to the Supreme Court, would you be satisfied?

Dr. H. C. Cooper: That is the procedure under the Income-Tax Act.

To our knowledge it has been working very satisfactorily.

Shri P. A. Narielwala: Whether you have a Tribunal or High Court, the Judge who sits on it must be really a competent person and a specialist in patent cases because the patent law is a very complicated matter.

Mr. Chairman: We may make sure that the Judge appointed is a competent person.

Shri P. A. Narielwala: He should really be an expert in that.

Mr. Chairman: He should be a specialist Judge.

श्री अचल सिंह : आप जानते हैं कि हमारे देश की नब्बे प्रतिशत जनता ग़रीब है। इस स्थिति में क्या आप कोई ऐसा सुझाव देंगे, जिससे जनता को दवाइयां, ड्रग्स और इन्जैक्शन वग़ैरह सस्ते दामों पर मिल सकें ?

Dr. H. C. Cooper: We have already answered this question earlier hat we do recognize that having regard to the conditions in our country, pharmaceutical drugs should be available at a reasonable rate. But we feel that the way in which the Bill is cast will do harm in certain other quarters and not try to achieve that objective.

Shri P. A. Narielwala: Let me also supplement this information by telling this Committee that in the last few months everyone, including the Drug Controller has asked the Industry to hold the price line. The example of Pimpri is not a satisfactory example for the industry. The price of streptomycin which is produced by Pimpri has in the last three months been increased instead of being reduced. As you know, even in penicillin produced at Pimpri because it is their monopoly, the price of penicillin in India is higher than what it is anywherelse in the world. Pimpri with very good profits which it makes can justifiably reduce its price of antibiotics if it is to serve the purpose which the hon'ble Member has in view.

Sardar Daljit Singh: Have you got any patent in foreign countries?

Dr. H. C. Cooper: Some of the industries do have patents of a few products in foreign countries and our information is that this tendency is now increasing day by day.

Shri P. A. Narielwala: The National Research Development Corporation will give all that information that you have asked for, the number of patents for products of Indian origin that they have patented in the market in foreign countries, etc.

Sardar Daljit Singh: You have mentioned that there should be a Board on the lines of the Copyright Board for appeal against the decision of the Controller.

Mr. Chairman: He asked this question and he has just now answered it.

श्री प० ला० बारूपाल : मैं यह जानना चाहता हूं कि विदेशों से मंगाई जाने वाली दवाइयों के मुकाबले में भारत में बनने वाली दवाइयों की क्या स्थिति है और इन दोनों प्रकार की दवाइयों की प्राइस में क्या अन्तर है।

Dr. H. C. Cooper: We will not be able to answer this question offhand in the absence of the immediate availability of statistical data here. But we could give this information

श्री विभूति मिश्र : मैं यह जानना चाहता हूं कि आप पेटेन्ट के पक्ष में क्यों हैं।

Dr. H. C. Cooper: We are on the side of national interest; we are not on the side of patents as such.

श्री विभूति मिश्र : आप जानते होंगे कि हिन्दुस्तान में योगराज गुग्गुल को शार्गधर

या भावप्रकाश के फ़ारमूला से बनाया जाता है। यह दवाई गठिया आदि रोगों में प्रयुक्त की जाती है। हिन्दुस्तान में हर जगह वैद्य फैले हुए हैं और वही वैद्य सफल होता है, उसी की प्रैक्टिस चलती है, जो ठीक विधि से और रोगी के लिए लाभकारी दवाई तैयार करता है। अगर पेटेंट की व्यवस्था हो जायेगी, तो एक ही आदमी को एकाधिकार हो जायेगा—चाहे वह अच्छी दवाई दे और चाहे ख़राब दवाई दे। इसलिए पेटेन्ट की व्यवस्था देश की 45 करोड़ जनता के लिए हितकर नहीं होगी। जैसा कि मैंने कहा है, आज योगराज गुग्गुल को शार्गधर या भाव-प्रकाश की फ़ारमूला से बनाया जाता है। आज उसका कोई पेटेन्ट नहीं है। इस प्रकार की दवाइयों का पेटेन्ट करने से जनता को बहुत परेशानी और हानि होगी। आप इस बारे में अपने विचार बताइये।

Dr. H. C. Cooper: In respect of some of these indigenous medicines the situation is that they make an application for patent. They disclose the particulars but the basic formula is never disclosed at all.

Shri P. A. Narielwala: You know in Ayurvedic medicines each Vaid has his own particular formula. He should take the responsibility of obtaining the formula and perpetuate the protection of the Ayurvedic drugs in the country. There is no formula. You have to sit down and persuade the Vaid to disclose his formula where he is given the patent protection.

Mr. Chairman: Some of them are publishing the ingredients.

Shri P. A. Narielwala: Very few. After all in the Ayurvedic and Unani systems, the Vaid gives the patient something saying, 'You take this and you will get cured.' What it is you do not know. In fact in the Central Medicinal Plant Organization of which I have been the Chairman, we have more than once asked them, 'Please identify this product because it is used in Ayurvedic medicine' and we have invariably found that when I talk of medicinal plant product, that plant does not exist any longer or does exist but there are some variations of that plant and that it is difficult to identify which of that particular plant is the one which is used in the Ayurvedic medicine. I can give you instances of that.

श्री विभूति मिश्र : चेयरमैन साहब, यह योगिराज गुगुल का फारमूला उस पुस्तक में लिखा हुआ है कि फलां दवा इतनी, फलां दवा इतनी। वैद्य इसको लिख देता है। जो रोगी होता है वह उन दवाओं को खरीद कर लाता है। वैद्य उसका इंसपेक्शन करता है। कहता है कि अमुक दवा खराब है, इसको बदल कर लाओ। फिर उसके सामने दवा बनायी जाती है और योगिराज गुगुल बड़ी मशहूर दवा है और उसी वैद्य की चलती है कि जो अच्छी तरह से बनावे। लेकिन इनका फारमूला तो सीक्रेट रहता है। हिन्दुस्तान में किसी दवा को पेटेंट कराया तो 45 करोड़ आदमियों के लिए उसके पास ऐसा संगठन होना चाहिए और फिर मसानी साहब तो वह दवा खरीद कर खा सकते हैं क्योंकि धनी आदमी हैं लेकिन आम जनता जिसकी 20 रुपये 25 रुपये मासिक आय है वह नहीं खरीद सकती है। पेटेंट करने से आप उसे एकाधिकार देते हैं तो आप पेटेंट के पक्ष में क्यों हैं। इसलिए हैं कि आप पूंजीपतियों को बढ़ावा देना चाहते हैं।

सभापति महोदय : पेटेंट एलोपैथिक मेडिसिन्स के लिए है, आयुर्वेदिक के लिए नहीं है।

श्री विभूति मिश्र : आयुर्वेद का वैद्य जब कोई दवा बनाता है तो जनरल सिद्धान्त उसका है, जिसके अनुसार वह उसका एक सर्टेन पोर्शन फ्री डिस्ट्रीब्यूशन के लिए रखता है। अगर एक सेर बनाये तो उसका 10

प्रतिशत या 15 प्रतिशत खैरात के लिए रखता है । तो क्या पेटेंट वाले दवा बनायेंगे तो उसमें कुछ ऐसा है कि इतनी दवा बनाकर इतना उसका पोर्शन खैरात करेंगे । दूसरी बात, हिन्दुस्तान का फारेन एक्सचेंज जूट ग्रोअर, टी ग्रोअर और टेक्सटाइल ग्रोअर यह तीन पैदा करते हैं जिसमें गरीब आदमी ज्यादातर जूट पैदा करते हैं । तो मैं यह जानना चाहता हूं कि कोई ऐसी दवा हिन्दुस्तान में पेटेंट हुई है कि जिसमें बाहर से उसका कोई सामान न मंगाना पड़ ।

Dr. H. C. Cooper: There are plenty of such things . . .

Mr. Chairman: We will discuss it among ourselves.

Shri P. A. Narielwala: We are not representatives of the pharmaceutical industry to answer these questions. But the Hon'ble Member should know that in the jute industry, in the textile industry, tea industry, in every industry, medical facility is provided freely by the companies concerned to the workers.

श्री विभूति मिश्र : मैंने पूछा कि कोई ऐसी दवा है कि जो हिन्दुस्तान में पेटेंट करायी गयी हो और जिसमें बाहर से कोई दवा या सामान न मंगाना पड़ा हो ।

Dr. H. C. Cooper: The answer is in the affirmative.

Shri Kashi Ram Gupta: Give examples.

Shri P. A. Narielwala: As we are not representatives of the pharmaceutical industry, we do not have this information. If you want we can find out from the pharmaceutical industry.

Dr. H. C. Cooper: Penicillin itself is an example which the Hon'ble Member wanted.

श्री विभति मिश्र : आप विटनेस देने यहां आये हैं और आप कहते हैं कि इसका जवाब आपको मालूम नहीं है । मैं जानना चाहता हूं कि कौन कौन सी दवा ऐसी हैं जो कि हिन्दुस्तान में पेटेंट हुई हो और हिन्दुस्तान में ही उसका सारा सामान मिला हो, बाहर से न मंगाना पड़ा हो ।

Shri P. A. Narielwala: Only on Sunday last, Dr. Venkataraman, former Director of the National Chemical Laboratory gave an example of Vitamin C, a process for the production of which was evolved by our own Scientists at the National Chemical Laboratory from Indian raw materials. He gave a pathetic story of how the process, which is patented, which was offered first to the Hindustan Antibiotics for exploitation, has not yet been utilised, owing to constant changes in the post of Managing Director. It comes up and then it is withdrawn because the next Managing Director does not like it. I say this with his knowledge; I don't think what he said was confidential. But this is a fact. A product evolved by our own scientists from our own raw materials is not being utilised or exploited. Substances like penicillin; Vitamin B12, Vitamin A, etc., which are now made in this country are basically from Indian raw materials. I think now they are going to start again on Vitamin C.

श्री विभूति मिश्र : क्या आप चाहते हैं कि कोई दवा का आविष्कारक अपना आविष्कार किसी इंडस्ट्रिअलिस्ट के हाथ बेच दे तो बेचने के बाद जो दवा तैयार होती है उसमें कितना खर्च होता है, कितना उसका मुनाफा हो, इन सारी चीजों के जांच के लिए कानून में कोई धारा होनी चाहिए ताकि उसके अनुसार उसकी कीमत ठीक ठीक निश्चित की जाय जिससे देश के इंडस्ट्रिअलिस्ट्स को भी कुछ फायदा हो जाय और गरीब जनता को भी सस्ती दवा मिले ।

Dr. H. C. Cooper: We have no information in our possession to answer these questions.

श्री राम सेवक यादव : अभी चौरड़िया साहब के प्रश्न का उत्तर देते हुए श्री नारीवाला ने कहा था कि जितनी बिक्री होती है उसका एक प्रतिशत खोज पर खर्च होना चाहिए और अभी यह भी उन्होंने कहा कि हिन्दुस्तानी साइंटिस्ट को खोज से प्रोत्साहन मिले इसलिए पेटेंट कानून की आवश्यकता है । मैं जानना चाहूंगा कि जो एक प्रतिशत खर्चे की वह बात करते हैं उससे उनके वेतन के अतिरिक्त और क्या मिलने वाला है ।

Shri P. A. Narielwala: Sir, this is a matter which must be determined by the industry itself or by the industrial company where the scientist works. There is an agreement between the scientist and his board that if he evolves a patent and that patent is exploited by the company, the scientist shares either in the form of a recurring royalty or in the form of a lump sum.

श्री राम सेवक यादव : क्या अब तक हिन्दुस्तानी साइंटिस्ट ने किसी नयी चीज का आविष्कार किया और उस आविष्कार से जो फायदा हुआ उसमें से उनको कुछ मिला ?

Shri P. A. Narielwala: Very many scientists are benefiting. The Council of Scientific and Industrial Research or the National Research Development Corporation will tell you how much of the money has been given to scientists.

श्री राम सेवक यादव : उनको वेतन के अलावा क्या मिला यह मैं जानना चाहता हूं ।

Shri P. A. Narielwala: I can't give this information. The Chamber has not got this statistical information.

श्री राम सेवक यादव : दूसरा सवाल है मेरा कि आपने एक प्रश्न के उत्तर में कहा कि इटली में पेटेंट कानून के अभाव में दवायें रद्दी बिकती थीं तो क्या यह समझा जाय कि पेटेंट कानून अगर हो तो वही काफी है दवाओं को ठीक रखने के लिए; और दूसरे कानून की आवश्यकता नहीं है ।

Shri P. A. Narielwala: Sir, if there is a control on the medicine as a result of patent specifications, then the manufacturer will be governed by the particular rules and regulations. He can't steal the patent and try to produce. He tries to produce according to his method, but it may turn cut that he does not have the technical know-how. The patent indicates broadly temperature, pressure, etc. But it does not indicate exactly what is the exact temperature and pressure in which to operate. Therefore, invariably it would result in sub-standard drugs. We have this experience in our own Indian industries.

श्री राम सेवक यादव : आपके कथनानुसार पेटेंट से आविष्कार और टेकनिकल नो हाउ को प्रोत्साहन मिलेगा तो मैं जानना चाहता हूं कि इससे उन्हीं देशों को फायदा होता है कि जहां खोज ज्यादा तेजी से चल रही हो और जिन देशों में खोज पर ज्यादा पैसा खर्च नहीं होता उनको नुकसान होता है ।

Shri P. A. Narielwala: I do not see how we are competent to answer that question whether there is loss or gain. We are trying merely to protect, our own scientific workers against the rigor of a Bill as drafted. We want to see that the Indian research develops quickly so that our own men produce a range of patented products. It will be seen that over the period of years, the number of Indian patents is gradually increasing as compared with what it was 10 years ago. That is an information which I think the Controller of Patents will give you.

श्री राम सेवक यादव : इस देश में आविष्कार और टेकनिकल नो हाउ की जानकारी बढ़े और नये आविष्कार हों इसके लिए क्या आप जरूरी समझते हैं कि आविष्कार करने वाले वैज्ञानिकों को वेतन के अतिरिक्त

अगर किसी नयी चीज़ का आविष्कार वह करते हैं तो उससे जो मुनाफा होता है उसका भी परसेंटेज दिया जाय और उसके लिए कानून में प्राविजन की ज़रूरत है ।

Dr. H. C. Cooper: In actual practice, they get it. In a large number of cases they get a percentage.

Shri P. A. Narielwala: For the last one or two years, Indian manufacturers are now going abroad with their technical know-how. You may have heard recently of the case of Hard Board Factory which has put up a factory in Canada. Indian know-how, Indian technology is now being exported to Canada where it has been given special patent protection. This is merely a single instance. As we develop, we shall do so.

श्री राम सेवक यादव : मेरा सवाल तो यह था कि जब इंडियन साइंटिस्ट किसी नयी चीज का आविष्कार करते हैं और उससे कोई कारखानेदार मुनाफा कमाता है तो उस मुनाफे से उसको एक हिस्सा मिले ताकि वैज्ञानिकों को प्रोत्साहन मिले इस तरह की कोई व्यवस्था कानून में होना जरूरी है ।

Dr. H. C. Cooper: We are not in favour of any statutory regulation for this purpose but the matter must be entirely left to be negotiated between the scientists and the industrialists concerned.

श्री राम सेवक यादव : इसकी आवश्यकता समझते हैं आप कानून में न सही वैसे जरूरी है ।

Mr. Chairman: He says, by agreement of parties.

Official from Ministry: Apart from the expenditure by Government on research, can you give us any information of the amount of money spent by private industry on research?

Dr. H. C. Cooper: We do not have the data except the broad general fact that many of the research institutions, for instance, the sponsors of the art silk and other associations, the textile industry etc. have been spending very considerable amount.

Official: Can you give us some information.

Dr. H. C. Cooper: We will try to collect more precise information and give you.

Shri P. A. Narielwala: There is the Tea Research Association. The cotton textiles have 3 laboratories—one in Bombay, one in Ahmedabad and another in South India. We will try to get the Information.

Shri R. Ramanathan Chettiar: Only one question. We are providing in this Bill process-cum-product patent. Do you agree with this?

Shri P. A. Narielwala: Normally, it is the process which is patented, but, particularly in the pharmaceutical industry or some other chemical industry sometimes a product patent may become necessary and desirable. Therefore, provision for a product patent should also be there.

Shri R. Ramanathan Chettiar: You agree with this?

Shri P. A. Narielwala: Yes, Sir.

Mr. Chairman: Thank you very much.

Dr. H. C. Cooper: We are most grateful to you Sir, and to the Committee for a very patient hearing.

(Witnesses then withdrew).

The Committee then adjourned to meet again at 15.00 hours).

(The Committee reassembled at 15.00 hours).

II. Trade Marks Owners Association of India, Bombay—1.

Spokesmen:

1. Shri S. H. Gursahani, Chairman
2. Shri R. A. Shah
3. Shri C. K. R. Rao, Secy.

(The witnesses were called in and they took their seats)

Mr. Chairman: Any evidence that you give is public. It is published and distributed to our Members, and also laid on the Table of the House. Even if you want any portion to be confidential, it has to be published and circulated to the Members. We have received your Memorandum and it has been circulated to all the Members. If you want to add anything, you may do so. After that our Members will put questions. Please begin.

Shri S. H. Gursahani: Mr. Chairman, with your permission, may I have a minute or two to say something about the Association which I represent. I will also introduce very briefly the colleagues accompanying me here to assist the Committee. The Trade Marks Owners Association of India, of which I am the honorary Chairman (my other occupation is that I am an officer of Hindustan Levers) was formed in 1953 at the suggestion of the then Minister for Commerce Shri John Mathai in order to encourage the study of problems relating to all forms of intellectual properties including patents, trade marks, designs, etc. which have importance in national or international trade and commerce. The Association has since then been doing its best to assist the Government and represents in its membership a cross-section of Indian industry ranging from light and heavy engineering to cigarettes and matches, soaps and toiletries food products, pharmaceutical and chemical industry and various other consumer and non-consumer industries. The purpose of the Association is to study objectively and from the industrial point of view the implications of Industrial Property Law. Mr. Rao, on my right, is the permanent Secretary of the Association and before he joined the Association he was a prominent lawyer in Bangalore. Mr. Shah, on my left, is a practising solicitor and a senior partner of a well-known firm of solicitors in Bombay and he has been closely associated with the professional activities of the Association.

Sir, we have submitted our memorandum and we are fully alive to the fact that the time of the Committee is extremely valuable and we should not use this opportunity merely to reiterate what we have said before but only to supplement and elaborate.

Shri R. Ramanathan Chettiar: To which firm do you belong?

Shri S. H. Gursahani: I belong to Hindustan Levers in my day-to-day life and am the Honorary Chairman of this Association as one of my boundary functions.

Sir, the first point on which I would like to supplement our memorandum relates to clause 2(g) of the Bill which defines an article of food. The additional point which I would like to urge before the Committee is the power sought to be given to Government to extend the scope of this definition by notifying certain articles to be regarded as articles of food for purposes of this Bill. This may have the effect of introducing a degree of uncertainty in the minds of patentees as regards the scope of their rights and the duration of the protection. An article which may not have been capable of being an article of food when the patent was granted could by Government notification be converted into an article of food with the result that any patent granted, for the product itself as might have been permissible at the time of the grant of the patent, may then get in danger of being revoked on the round that it is now to be regarded as an article of food. The other effect is the duration of the patent which initially may have been granted for the full period of 14 years, under the general clause of the Bill, may nevertheless be curtailed to

10 years on the ground that it has now become an article of food. These are the problems to which I have not been able to see a satisfactory solution in the Bill. I would like to say that if the definition is capable of being changed by the Government notification it is possible that this may give rise to argument and possibly litigation, to determine whether an *ipso facto* curtailment of the rights of patentee has taken place as a result of such a notification.

The next clause in our representation which I would like to elaborate further is clause 2(1) which defines a drug. I would specially direct my comments to the aspect of the definition which includes within its ambit intermediates used in the manufacture of drugs. I feel, and I am so advised, that a very large number of chemicals which are in one way or another, capable of being used as intermediates in the drugs industry will get involved within the scope of this definition with the result that by and large every known chemical will be subject to the special treatment accorded in the Bill to drugs.

Phenol, salicylic acid and acetic acid are all intermediates in the manufacture of one of the best known drugs namely aspirin. Yet all these three different primary uses, Phenol is an important intermediate in the plastics industry and salicylic acid in the dye stuffs industry. Acetic acid is table vinegar in certain dilutions.

The next point which we have not taken up in our memorandum, I hope you will forgive me because as one studies the Bill even after submission of the memorandum certain points do emerge for consideration which may be worth mentioning to the Committee in the hope that it may be of some assistance to the Committee, is clause 3 (d) which removes from the area of patentability new uses of known substances or new uses of known processes. I submit that in certain contexts and quite frequently, it might be useful and important that our inventors may be directed towards finding a new use of a known substance and these new uses themselves acquire very great importance in our industry and, therefore, deserve to be treated with the same respect, if I may use that term, as an invention as if the substance is itself discovered for the first time and this is particularly true, if I may say so, in the drug and pharmaceutical industry.

Where substances discovered for the first time to have curative properties as life-saving drugs either by themselves or in combination, by the inventive genius of people engaged in drugs industry, it may be worthwhile to afford to them the same protection as one would afford to the drugs in general. Similarly, processes may be known, but a new application of a process, I submit, is equally an invention and it may be very important, and, therefore, deserves to be protected in the same way as any other invention. In fact, we believe that the legislations of most countries permit inventions of these kinds to be patented.

We have not commmented in our Memorandum on Clause 5, which restricts patent protection in the case of drugs, medicines and food to the process of manufacture, and not the substance itself unless it is manufactured by the process which is patented; and we support that this should be so. Protection to the product substance *per se* need not be given. But this is subject to our contention that where a substance has been introduced in the market by an infringer, the burden of proving that the product has been manufactured by a process different from the patented process should be upon the infringer, and not upon the plaintiff who takes him to the court. This will then be in line with the procedure and the law followed by all those countries which do not protect products *per se*. This, we believe, is desirable whether or not that particular product is imported or locally manufactured. It is difficult for a plaintiff to be able to discharge the

onus of proof before the court that the product manufactured by his rival is in fact manufactured by his patented process. It is very difficult when the product is imported. It is, to my mind, not an easy matter for any plaintiff to establish even by appointing referees to find out whether the product has been manufactured by the patented process. So far as the imported products are concerned, I am advised that our Indian law, through court decisions, already recognises the fact that the burden of proof in such cases is upon the infringer. We ask you to consider the extension of this principle to cover cases even when the product is locally manufactured.

In respect of Clause 53, I would only like to add one very minor point. In the various sub-clauses of this clause, the same words are used as in the definition of "food" and "drugs", namely, "intended to be used" and "capable of being used". My suggestion is that there is no need to redescribe these particular products, following the definitions given earlier in the Act. I am suggesting that if for reasons of submissions made, the definitions are changed as a result of further consideration by the Committee there should be no need to make consequential changes in the various clauses of the Bill if the defined terms as such are used in the other sections of the Bill. We may sometimes overlook to make consequential changes.

In clause 53(1)(a) we say: "Where the substance is intended for use or is capable of being used as 'food' ". This is, in fact, a mere repetition of the definition of "food" contained in an earlier clause of the Bill.

Mr. Chairman: It is a question of draft.

Shri S. H. Gursahani: I suggest that these words may be deleted. I think the word "food" will convey the same meaning as already given to it in the definition clause.

As regards the other points that we have taken up on clause 53, despite my promise that I will not elaborate what has already been said, all that we suggest is that while fixing the period of protection at 10 years in the first instance the door should not be entirely shut against instances where genuinely it may be reasonable to consider a request for a short extension on the ground that there has been no fault on the part of the patentee. I would request the Committee to give a sympathetic consideration to this suggestion. It has been said that ten years is not a short period and that the industry has been known to reimburse itself with research expenditure in a lesser period. That is a question of fact. But in the case of certain patents, it is likely that a lot of preparatory work has to be done before full production on a commercial scale can be resorted to and adequate return can be taken by a person responsible for the invention and research. We have suggested that there should be two extensions permissible under the Act, in stringent conditions if you like, where the Controller should be able to decide on the merits of each case to give two extensions of two years each. It will in exceptional cases bring the patent back to the 14 years period. Clause 88 puts a ceiling on the royalty payable on patents of a certain nature. On this we have three comments.

Firstly, our quarrel is not that it is not 8 per cent or 10 per cent. There is no magic in fixing any ceiling because as human experience shows, anything which is prescribed as maximum quickly degenerates into the normal. Surely there will be patents which deserve far less, and others which deserve much more, but the result may well be that this 4 per cent may tend to be accepted without a careful investigation.

Secondly, the exploitation of a patent or invention carries with it two other aspects which are equally important and which are usually delivered to the licensee in the form of a package. Apart from the patent specifications, which by themselves are not

of such tremendous value unless they are accompanied by technical know-how, they are also usually accompanied by the right to use a brand name or a trade name. The three together constitute the transfer of the right of manufacture from one person to another. There is no ceiling fixed so far as the transfer of technical know-how is concerned nor the trade mark. They are still in the area of discretion with the appropriate Government machinery. To fix a ceiling with regard to only one aspect will in the first place, according to us, result in difficulties of co-ordination, and where the parties find that as a result of the ceiling inadequate royalty is being sanctioned for the patent attempts will naturally be made to try and make that up to the extent possible by securing a larger amount for the transfer of technical know-how and for the use of trade marks. It is preferable to leave the entire field to the discretion to senior Government officials, because these economic matters are ultimately agreed upon and co-ordinated at very high levels, where Economic Secretaries through various committees consider the full implications of any particular proposal. It would be desirable to do it in that manner than to consider it piecemeal.

Thirdly, fixing the ceiling with reference to the bulk price or ex-factory price of the patented article may have the unfortunate effect of rewarding an inferior invention rather more than a superior one, because, to the extent to which an invention results in a certain ex-factory bulk price and to the extent to which that price is higher, the royalty will be more as long as it is related to a percentage of that particular price, and any process which cuts down the cost of manufacture will suffer by earning for the patentee a lesser amount by way of royalty. Today royalties are fixed with reference to several factors, one important factor being the amount of saving which it means to the licensee, and in such a case the licensee will evaluate the importance of the licence to him not in terms of the price of the product but the saving that he is able to effect as a result of using an alternative manufacturing process which he is getting from the patentholder. Therefore, the rigidity that it should be 4 per cent on the one hand, and that it should always be related to the price of the product ex-factory shuts out consideration of other factors to which it can be more reasonably related.

The Bill provides for appeal to the Central Government in certain cases and no right of appeal at all in other cases. We find that in many important respects there is no right of appeal. I suggest that in order to cut down delay and expense, you might consider setting up an administrative tribunal on the lines of the Income-tax Appellate Tribunal with jurisdiction over all industrial property laws—not only patents, but also copyrights, designs, trade marks, works of art and literary works etc.—so that in course of time you have a tribunal which is well versed in this rather intricate branch and is able to dispose of disputes between parties and between Government and citizens expeditiously and expertly. To begin with, a centrally located tribunal may fulfil the need, but depending upon the number of matters that come to it, it may probably have Benches in industrial towns like Bombay and Calcutta, consisting of retired or sitting Judges of the High Court or others qualified to be appointed such judges. The number of persons who will constitute it is a matter of detail which can be worked out in the light of experience.

Mr. Chairman: Would you give the right of appeal to the Supreme Court on points of law?

Shri S. H. Gursahani: The writ jurisdiction of the Supreme Court cannot in any case be ousted. The suggestion I made would only replace going to the High Court.

Clause 64(h) which has retrospective effect, we believe, is likely to cause, in actual practice, complications and problems for the patentee, and the Com-

mittee might be good enough to examine whether the hardship of retrospective effect can be mitigated.

Shri M. R. Masani: I was interested in your suggestion that royalty might be linked with something else than the ex-factory price. I thought you made quite a good point when you said that this will act as a disincentive to cutting costs. Can you suggest an alternative formula to which you can hitch the royalty where it would solve itself? It is true that the idea of saving is good, but I am not able to see how you link the royalty to the saving. Would you be good enough to give an alternative formula later on, if you do not have it ready now?

Shri S. H. Gursahani: I have not got any formula at the moment. But I should imagine that when two persons sit down and negotiate how much royalty is to be given, the buyer must be fully aware what this means to him in terms of saving. He would not try to buy it otherwise. It is a question of reaching a reasonable formula between themselves, which would give one a reasonable return and the other a reasonable value for it. I am sorry I have not got any particular formula as such.

Shri M. R. Masani: So, the amendment you suggest would be one to remove the four per cent ceiling altogether and in any event to remove the ex-factory price as a way of computing the four per cent.

Shri S. H. Gursahani: That question might be re-examined along the lines of our suggestion.

Mr. Chairman: Will you be satisfied with an agreed royalty, subject to the approval of the Controller-General?

Shri S. H. Gursahani: This would be certainly an improvement in the sense that no rigid ceiling is enforced. But there is the other point which I made a little while ago, namely, that it is in fact a three pronged consideration, so that it might be the Controller if you like, or anyone who is competent to look into all the three aspects.

Shri Kashi Ram Gupta: Please refer to page 2 of the memorandum regarding clause 8. You have mentioned at the end that "it is therefore submitted that sub-clause (2) of this clause should be amended to read as 'If the Controller entertains a reasonable doubt as to the novelty or the patentability of the invention, he may, for reasons to be recorded in writing, require the applicant to furnish details relating to the objections'.". How can you distinguish this point, "reasonable doubt as to the novelty"? What is meant by reasonable doubt? How can one interpret in law whether a doubt is reasonable or not?

Shri S. H. Gursahani: We do deal with points of reasonableness throughout our commercial and ordinary life, and I respectfully submit that it should not be difficult for an experienced controller to say that in a particular instance, he is not quite certain whether an invention for which protection is being sought is novel or not. In such a case he may wish to be assisted by people outside the country who may have greater knowledge and greater experience in dealing with these matters, and therefore ask the applicant to assist him in respect of any objections that might have been raised else where and what has been the outcome of the application.

Mr. Chairman: Normally he is guided by the opinion of experts here.

Shri S. H. Gursahani: If he is advised by his advisers that this is a matter which is not free from doubt, he may then be assisted by the experience of people outside.

Mr. Chairman: Why go outside? We have our own experts and assessors here.

Shri S. H. Gursahani: I was meeting this point half-way, in the sense that one cannot say that we are self-sufficient in technical knowledge and ability to assess claims. Much has been

said about a large number of patents on the register today which need not have been on the register had we had more experience in evaluating those claims.

Mr. Chairman: I can understand a situation where there is no expert, but when we have our own assessors and advisers, you should be guided by their opinion. Don't you agree?

Shri S. H. Gursahani: Primarily yes.

Shri Kashi Ram Gupta: Why do you want the law to include these wordings? These wordings need not be included in a legal way. "For reasons to be recorded in writing"—that is the process they have got.

Shri S. H. Gursahani: As the Bill stands at the moment, it is an automatic requirement if an application has been made elsewhere; the applicant is obliged to keep the controller fully informed of the progress of the application elsewhere, the objections raised and the answers given and the outcome of the application. All that we are suggesting is that this should not be automatic. This should be necessary only when the controller considers it necessary and calls upon the applicant to furnish information, and as a further safeguard, we suggest that this should be done by the controller after recording his reasons in writing. This goes to the fundamental issue that when an order is passed, the applicant should be given full opportunity to know the basis on which a particular order is being passed because a certain obligation is being imposed on him. I would take the point of the hon. Member that as long as it is not automatic, most of our point is met. This requirement should not be automatic.

Shri Kashi Ram Gupta: At page 3, clause 15(2) (a), you say that the controller may refuse an application if it has made any contravention of the chapter on conventions has been made and if the contravention is wilful or inadvertent. You say that when it is an inadvertent contravention of the provisions of this section, the controller should have the power to treat the application as a non-convention application. Again, the distinction between wilful and inadvertent contravention in a legal way does not seem to be a practical proposition.

Shri S. H. Gursahani: My humble submission is that this is a legal enactment to be enforced by the authorities, who will apply it according to law and will have to interpret the various provisions of the law, and, we trust, competently, and therefore, I see no particular difficulty in deciding whether a thing is wilful or otherwise. This particular issue is decided by quasi-judicial officers, judging people's conduct and seeing whether it is wilful or inadvertent. All that we are saying is that not in every case should an applicant be deprived of the right altogether of getting his patent protected, merely because he has erroneously claimed a priority to which he is not entitled. The worst that should happen is that the priority could be taken away if criminality or culpability can be attributed to him.

Shri Kashi Ram Gupta: Was there not a similar case covered by a clause in the previous Act?

Shri S. H. Gursahani: No. Even the BIRPI model law to which India's representative was a party has suggested that the only consequence of such a contravention should be that the priority should be taken away.

Shri Kashi Ram Gupta: In clause 53, you say that in no country is the protection as little as 10 years. In Italy it is 10 years.

Shri M. R. Masani: In Italy it is still at the stage of a Bill so Mr. Gursahani is right that there is no law.

Shri Kashi Ram Gupta: I am only giving him this information.

Now, take page 9, clause 96. You have put in a clause which I do not

find in the model law. You have said:

> "(2) For the purpose of sub-section (1) above the Controller shall not grant a licence unless he is satisfied that such other patented invention serves industrial purpose different from those of the invention forming the subject of the earlier patent, or constitutes noteworthy technical progress in relation to it."

Before this, you say that "In this connection, we would recommend to the consideration of the Committee the model clause prepared by BIRPI". The BIRPI model law does not contain this clause. Will you please clarify it?

Shri S. H. Gursahani: A similar provision does exist in the model law, although naturally it does not refer to sub-section (1) because that has been worded to suit the drafting requirements of this particular Bill. If you turn to page 62, section 36(1) of the model law, it says:

> "If an invention protected by a patent within the country cannot be worked without infringing rights deriving from a patent granted on a prior application or benefiting from an earlier priority, a compulsory licence may, upon application, be granted under the conditions specified in section 44 to the registered owner of the later patent, to the extent necessary for the working of his invention, in so far as such an invention serves industrial purposes different from those of the invention forming the subject of the earlier patent or constitutes noteworthy technical progress in relation to it."

Shri Kashi Ram Gupta: The wordings given here do not have the same context. So, if these wordings are adopted, will it not defeat the very purpose of compulsory licence?

Shri S. H. Gursahani: We respectfully believe it will not.

Dr. C. B. Singh: In page 1 clause 2(1) you say, "this definition of drug will have the effect of covering almost every known chemical". If you go a little further, you agree you begin from carbon, hydrogen, oxygen, calcium, sodium, etc. and the whole thing is covered like that. In that manner, you say chlorine forms a part, benzene forms a part, sodium forms a part and so on. The whole thing is covered like that. When we say 'drug' we are quite clear in our mind about it. Why should there be any doubt in your mind?

Shri S. H. Gursahani: There is no doubt in our mind. We only submit that the definition as it stands is so wide that it probably goes a little beyond the original intention of giving special treatment to a particular kind of patent.

Dr. C. B. Singh: You gave the example of benzene. With that, you can have so many things. Chlorine, benzene and everything comes in. That does not fit in with our definition.

Shri S. H. Gursahani: With due respect, I gave the example of benzene because I thought I might begin with benzene and go to two intermediates which are formed in the course of manufacture of a drug-phenol and salicylic acid. It is reasonable that the manufacture of asprin or any patents connected with that should be properly regarded as a drug subject to any special treatment. But there is no justification for including phenol which has got other primary uses and salicylic acid or acetic acid which is vinegar.

Dr. C. B. Singh: Benzene alone forms so many things like chloroquine, etc.

Mr. Chairman: If we say, any chemical which is used as an intermediate product, will that satisfy you?

Shri R. A. Shah: The real intention is to confine the definition to primary drugs, but as it stands, it covers not only drugs but also chemicals. Phenol is used in various other industries, but

unwittingly it becomes a drug for the purposes of this Act and suffers the same limitations applicable to drugs.

Dr. C. B. Singh: Phenol is used as a drug in itself for certain purposes. Benzene also is used as a drug.

Shri R. A. Shah: We are talking about the basic raw benzene, not tincture benzene; raw benzene is a petrochemical product.

Dr. C. B. Singh: About the period, are you quite clear in your mind that you do not want 14 years but 10 years with two extensions of 2 years each?

Shri S. H. Gursahani: If it is considered vital to make a distinction between drugs and other products, we would hold on to 10 years with two extensions of two years each.

Dr. C. B. Singh: About appeal, you have said that the appeal should be to a tribunal and highest appeal will be to the Supreme Court. Is that correct?

Shri S. H. Gursahani: We have suggested. rather than providing for appeals from Caeser to Caeser, it might instil more confidence in industrial property owners if there is a provision for appeal from the decisions of the Central Government or the Controller to a tribunal which might be independent of the department and which will look at the problem objectively and judiciously and not be hidebound by considerations of policy or executive action.

Mr. Chairman: You want that instead of appeals to the Central Government all appeals against the decisions of the Controller should go only to the tribunal and in the final stage to the Supreme Court?

Shri S. H. Gursahani: That is correct. We agree to that.

Dr. C. B. Singh: Evidence has come before us to show that the distinction between process and product is artificial, that a process can produce many products and so many processes can produce so many products. Do you subscribe to this view? Do you want that there should be product patent or process patent?

Shri R. A. Shah: I think there is a lot of rationality and justification in not granting or not protecting products by themselves, and in the circumstances in which we operate in this country I think it would be adequate and reasonable if products which are made by particular processes are protected.

Dr. C. B. Singh: You are in favour of patent for product by a certain process and not in favour of process alo nor products alone.

Shri R. A. Shah: Yes.

Dr. C. B. Singh: What are your reasons for that?

Shri R. A. Shah: Otherwise there may be a tendency to import from abroad articles which are manufactured about and such imported articles would not constitute a breach of the patent law here. That would be an incentive to imports and a disincentive to import substitution.

श्री चौरडिया : आपने देखा होगा कि कई लोग पेटेंट लेने के लिए जितने भी सम्भावित प्रोसेस होते हैं उनको पेटेंट करवा लेते हैं । क्या कुछ प्रोसेस पेटेंट करवाने की व्यवस्था ठीक रहेगी या सभी सम्भवित प्रोसेस पेटेंट वे करवा सकते हैं, यह व्यवस्था ठीक रहेगी ?

Shri S. H. Gursahani: If the protection is afforded to a product manufatured by the patented process, then I appreciate the hon. Member's question, that this can probably be got over to some extent by the patent holders trying to patent as many processes as they can think of and in this way not only achieve the limited protection of product by a particular process, but products by themselves. But, at the

same time, it is cumbersome. It would involve expense on research which will be unjustifiable, and we believe that the protection of product manufactured by a particular patented process is adequate.

Mr. Chairman: Supposing the protection is provided only for the process by which a product is manufactured, what is your reaction?

Shri S. H. Gursahani: The processes may be of a kind which may give rise to an end product.

Mr. Chairman: There may be half-a-dozen processes. He may use only one and not use the other five. We can give protection to that process by which he manufactures the product.

Shri S. H. Gursahani: I think he can, if he chooses, obtain protection for all the processes which may lead to a particular product. If, in addition to that, a further process, at any future time, be developed by somebody else, it will not preclude him from getting that process patented merely on the ground that it leads to the same product.

Shri R. A. Shah: If the other processes are not utilised he faces the consequences of compulsory licensing, revocation etc.

श्री चौरड़िया : आप चाहते हैं कि पेटेंट की जो अवधि है वह ज्यादा होनी चाहिये। आपको पता होगा कि हमारे यहां पर जब तक प्रोडक्ट्स पेटेंटिड नहीं रही हैं उनकी कीमतें बहुत अधिक रही हैं और उपभोक्ता को बहुत नुकसान उठाना पड़ा है। मैं उदाहरण आपको बताता हूं। विटामिन बी 12 की इनिशियल मार्किट प्राइस 2000 रुपये पर ग्राम थी और इसकी सबसिक्वेंट मार्किट प्राइस 40 रुपये पर ग्राम हुई। इसी तरह से स्टेप्टोमाइसीन की 19 रुपये ग्राम और अब 1 रुपये ग्राम है। प्रेडनीसोलीन की 15000 रु० एक किलोग्राम की प्राइस थी और अब चार हजार रुपये है। इसी तरह से टेट्रासिलीन की एक हजार रुपये और अब 240 रुपये है। कलोरामफिनीकाल की 1600 रुपये थी और अब 240 रुपये फी किलोग्राम है। इससे साफ जाहिर होता है कि इनवेंशन वगैरह के पैसे निकालने के बाद भी उपभोक्ता को बहुत ज्यादा दाम देने पड़ते हैं। दस वर्ष के बजाय अगर चौदह या सोलह वर्ष की अवधि रख दी जाए तो उपभोक्ता को बहुत ज्यादा दाम देने पड़ेंगे। उसकी इस तकलीफ को दूर करने के लिये आप क्या सुझाव देते हैं?

Shri S. H. Gursahani: Actually, this is a question of finding a balance between an adequate return as a reward for invention and thereby encouraging inventions or inventiveness in the country and the national interest of the people here. Ultimately, ten years, I believe, will afford in normal circumstances, a reasonable length of protection. But all that we pleaded for was that in proper cases the door should still be left open. One reason why we are not advocating an initial period of 14 or 16 years is that a shorter period of ten years will, to our mind, activate the manufacturers to try and intensify production and try to recover the research expenditure or preliminary expenditure that they might have incurred during that period by higher production. This will be an incentive to speedy translation of the invention into commercial exploitation.

श्री चौरड़िया : इसके लिये अगर कोई सीमा निर्धारित कर दी जाए कि इतने वर्ष की अवधि में इतने प्रतिशत से अधिक मुनाफा उनको नहीं दिया जाना चाहिये जिस में उनकी खोज का खर्च भी वसूल हो सके तो उसके बारे में आप का क्या सुझाव है?

Shri S. H. Gursahani: I am afraid, I did not understand the importance of this question.

Shri V. M. Chordia: If the prices are fixed in such a way that a margin is kept so that they may recover the cost of research and invention, at the same time ensuring that they may not charge an excess price, as was done in one case where they charged Rs. 2,000 per gram previously and Rs. 40 now, will you agree to that?

Shri S. H. Gursahani: I think the Government have adequate powers under the Industries (Development and Regulation) Act and the Essential Commodities Act to fix the prices of essential commodities. I have never been averse to judicious use of governmental power to fix prices at reasonable levels. But price fixation is not all that easy, in the sense that it must be preceded by a fairly complicated inquiry into the cost structure, into various other factors which go into the composition of the cost of manufacture of a particular product.

श्री चोरड़िया : ज्यूडिशल ट्रिब्यूनल के आप पक्ष में हैं । जब इसकी कांस्टीट्यूशन वगैरह के बारे में पूछा गया तो आप कोई स्पेसेफिक सुझाव नहीं दे सके हैं । क्या आप लिख कर भेज सकेंगे कि इसमें कितने सदस्य हों और इसका हैड कौन हो ?

Shri S. H. Gursahani: I assure that the hon. Member is referring to the judicial tribunal which I have suggested. It is difficult to foresee at the present time how many matters of industrial property law will result in appeals and what will be the speed with which they will be disposed of.

Mr. Chairman: We will consider that point.

Shri R. Ramanathan Chettiar: In the course of your observation earlier you referred to an apprehension about this Bill not protecting the industrial property.

Shri S. H. Gursahani: I do not recollect having made any such drastic observation about the Bill.

Shri R. Ramanathan Chettiar: You referred to adequate protection not being given to industrial properties.

Mr. Chairman: He did not say that.

Shri S. H. Gursahani: All that I said was that in a Bill of this kind you must necessarily try to find a balance between adequate protection on the one hand to those who spend time and money in inventions and national interest on the other. So, proper balance has to be reached. Then I went on to make a few general observations on the memorandum we had already submitted and I drew attention to certain points in the Bill which might perhaps be re-examined in the light of those observations and emphasized and supplemented some other observations.

Shri B. K. Das: Referring to page 4 of your memorandum, do I understand that you want a definite clause to be put down in the Bill that the onus of proof that a new process has been applied should lie on the defendant and not on the plantiff, that is, the patentee?

Shri S. H. Gursahani: That is my suggestion. It should be clarified by means of an appropriate provision in the Bill that in cases of this kind where protection is only given to a product manufactured by a particular process the defendant should have the burden of proof that the product put by him in the market is the outcome of a different process.

Shri B. K. Das: Under the existing law it is otherwise. But have you come across any case where the patentee has found it difficult to prove his own case?

Shri S. H. Gursahani: I have come across a number of cases in which imported articles are involved in in-

fringement. The manufacture takes place, let us say, in Europe. The local importer is charged with infringement. He is unaware of the process by which the manufacturer in Europe has manufactured the product. It is very difficult for the court here to judge whether the product imported is covered by the patent granted here especially when the manufacturer is not amenable to the jurisdiction of the Indian court.

Mr. Chairman: On page 8 of your memorandum you say:

> "The Government has powers under clause 48 to import for its own use or for the use of dispensaries and hospitals. This being so, it is only fair that any import on broader considerations of public interest (such as shortage of a particular article) should be undertaken only against payment of suitable compensation to the patentee."

If it is in the public interest, why should the Government pay compensation? Suppose there is an epidemic, should they not do that?

Shri S. H. Gursahani: We have suggested that the power should be exercised only in such grave circumstances; not otherwise. Public interest is a term which is so wide that it may *prima facie* refer to any governmental action. All that we are saying is, rather than throwing the door open for the Government to take action in any circumstances, let it be circumscribed in areas where it is really and vitally necessary like an emergency, epidemics or things of that kind.

Mr. Chairman: If it is done in a national emergency, or for defence purposes or when there is an epidemic, you have no objection?

Shri S. H. Gursahani: I have no objection. But still I do not see why even then compensation should not be paid. It is not only a question of quantum of money. The objection is to the principal infringing somebody else's rights.

Shri R. Ramanathan Chettiar: Article 31 of the Constitution says that no compensation is payable when public interest is involved.

Shri S. H. Gursahani: I think Article 31 does not provide for compensation.

(The witnesses then withdrew)

(The Committee then adjourned).

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Thursday, the 7th July, 1966 *at* 09.50 *hours*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Seth Achal Singh.
3. Shri Peter Alvares.
4. Shri Panna Lal Barupal.
5. Sardar Daljit Singh.
6. Shri Basanta Kumar Das.
7. Shri V. B. Gandhi.
8. Shri H. K. V. Gowdh.
9. Shri Kashi Ram Gupta.
10. Shri Madhavrao Laxmanrao Jadhav.
11. Shri Braj Behari Mehrotra.
12. Shri Naval Prabhakar.
13. Shri A. T. Sarma.
14. Dr. C. B. Singh.
15. Dr. L. M. Singhvi.
16. Shri Ram Sewak Yadav.

Rajya Sabha

17. Shri Babubhai M. Chinai.
18. Shri Vimalkumar M. Chordia.
19. Shri P. K. Kumaran.
20. Shri Shyamnandan Mishra.
21. Shri Dalpat Singh.
22. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMAN

Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Indian Pharmaceutical Association, Bombay.

Spokesmen:

1. Mr. K. C. Chatterjee, *Vice-President.*
2. Dr. J. N. Banerjee, *General Secretary.*

II. Bundesverband Der Pharmazeutischen & Industrie E. V., Frankfurt Am Main, West Germany. (Association of the German Pharmaceutical Industry, Frankfurt AM MAIN).

Spokesmen:

1. Mr. Curt Engelhorn, *President.*
2. Dr. Scholl, *Adviser.*

I. Indian Pharmaceutical Association, Bombay.

Spokesmen:

1. Shri K. C. Chatterjee.
2. Dr. J. N. Banerjee.

(*The witnesses were called in and they took their seats*).

Mr. Chairman: The evidence that you give is public; it will be printed and published; it will be circulated to all the members and will also be laid on the Table of the House. Even if you want any portion to be treated as confidential, it will be printed and published; it will be distributed to our members and will also be laid on the Table of the House.

You have given your Memorandum; it has been circulated to all the members. If you want to add anything or stress any point, you may do so. Thereafter members will ask questions.

Shri K. C. Chatterjee: First of all, I would like to thank you, Mr. Chairman, and the Select Committee for giving us this opportunity to be here today. As we have mentioned in our letter, Dr. U. P. Basu, who is the President of the Association, was taken ill suddenly and has, therefore, not been able to come. I, as the past President and the present *ex-officio* Vice-President, am, therefore, leading this team today and I would do my best to put some of the matters forward to you.

The Indian Pharmaceutical Association, which we represent, was started in 1941. We have branches everywhere—in all the States. There are 22 branches altogether. There are about 4,000 members. We publish a journal. The Association holds annual conferences where the various sections of pharmaceutical interests assemble and discuss their mutual problems. We do not have any trade union activities. Our headquarters are in our own premises in Bombay where we also run a college of pharmacy. Our interest is mainly academic, although we do help our members in professional

matters as well. But, as I have said before, our Association has no trade union activities.

I would like to introduce my colleague, Dr. J. N. Banerjee, who is the Secretary of the Association. He did his Bachelor of Pharmacy course in India and went to the University of Nottingham where he did his Ph.D. in pharmacology. He was a lecturer in the Glasco University for some time. He is also the President of the Maharashtra State Branch of the Indian Pharmaceutical Association. He was a member of the delegation in 1963 which went to U.S.A., U.K. Germany, Switzerland and Japan. He is an examiner in pharmacology for various universities, including Bombay, Rajasthan and Saurashtra. He is also a Joint Managing Director of Sandoz.

About myself, I am K. C. Chatterjee, My basic pharmaceutical training has been in the U.K. I returned during 1938—44 War; I returned in 1942 and joined the Government as an Industrial Planning officer in drugs and medicines. I then joined M/s. Boots Pure Drugs Co., in India where I was the works Manager as well as a Director. I have left this company some time ago to take up independent pharmaceutical consultant business. I am now consultant to a number of pharmaceutical factories, but I am not in anybody's pay roll. I was the President of the Association. I was also the President of the Indian Pharmaceutical Congress. I am a member of the Pharmacy Council of India, a member of its Executive Committee and also the Chairman of the Education section. I am also a member and the Vice-President of the Maharashtra State Pharmacy Council. I am also a member of the Development Council in pharmaceuticals. I am also an examiner in various pharmaceutical subjects. I am a Fellow of the Pharmaceutical Society of Great Britain. I am also the hony. Principal of the Bombay College of Pharmacy. In fact the main reason why I have given up a fixed job is to be able to serve the Association in the capacity of hony. Principalship.

Shri R. P. Sinha: Is it not an Industries' Association?

Shri K. C. Chatterjee: It is mainly an academic body. We have some industrial problems pertaining to some of our members but we are not interested all that in the financial side. What we have is: a large number of our members are pharmaceutically trained and qualified. They are working in the industry and research and in manufacture and it is their problems, the technical side of their problem, the association deals with.

Shri R. P. Sinha: Only individuals can become members of the Association. Am I correct?

Shri K. C. Chatterjee: Yes. They need to have a certain amount of pharmaceutical background, pharmaceutical academic training.

The interest that our Association members have in this Patent Bill is that a fair number of our members have gone abroad; they have come back and in addition a large number are trained now in the Indian Universities and at least half of our members are capable of pharmaceutical research and contribute in some way to the advancement in the industry. It is our object to see that the facilities that our members now seek both in the Institutes and in the industry receive some inpetus. It is also in the interest of our Association members to emphasize that we would like to see that the country reaches a high level of technical know-how if possible by our own efforts, if not by any other method that our country can get. Our members would also like to see that actual manufacture in India is done of synthetic chemicals, not merely of pharmaceutical formulations. In that way also we like to feel that our members would be greatly benefited and will also be able to help by bringing about advancement of the industry.

So our interest is not as much in the financial part of the industry as we would like to see that pharmaceutically qualified personnel have scope either in the Universities or in the industry to develop the research and other technical expertise. From this point of view our Association has looked at the Patent Bill and we have felt that although there has been at one time some talk of abrogation of patents altogether, the Government has instead decided at the moment to amend it which we think will be conducive to the objects that we have in mind.

The Association agrees with a very large number of provisions in the Bill and I would not waste the time of the Committee by saying which way we agree. But there are just a few points where we feel that certain amendments will be liked by our Association members. We have chosen in our memorandum only a few points where we have complete unanimity amongst our members. In fact these were submitted in the form of memorandum. It is probably unnecessary for me to go pointwise at this stage. But there is one point that I would like to mention about clause 53 regarding term of patent.

In our memorandum you would notice from paragraph 8 that our Association has recommended that the period should be 16 years. We had further discussions on the subject and we do not feel that 16 years should be all that necessary. We would like to say that 10 years would be adequate provided that in some cases where perhaps a lot of time is wasted in launching a product, there be some facility of extension of time. If after the chemical research in the laboratory and registration of the patent, some 8 years were spent until it was possible to put this product in the market, in such special cases some consideration should be given for extension of the period.

Shri R. P. Sinha: I would like you to give us some examples. What do you mean by 'special cases'?

Shri K. C. Chatterjee: Take the case of thalidomide when sometime after the product was introduced, it was found to be toxic. The net result of that is that the pharmaceutical industry is now a little too fearful; it may now conduct clinical trials to make quite certain that there is no toxic effect on the present or even the next generation. It might take in certain specific cases much more time to assess its potentialities not only potentialities but toxicity and it may not be possible to introduce a product for 5 or 6 or 7 years after registration. In a case like this special consideration should be given. Otherwise 10 years is adequate.

Shri V. B. Gandhi: Would you specify what you mean by special consideration? Do you mean extension of period by 2 years?

Shri K. C. Chatterjee: Extension of not more than 4 years. The only difficulty that comes to our mind is a legal matter and here we are not really competent to say very much. It may be picked up by persons who are legally more qualified than we are. If the same substance is used both pharmaceutically and chemically and if one has 14 year life and the other 10 year life, there may be some legal complications. But as far as our association is concerned, we shall be quite happy to see a 10-year period with provision for extension in very special cases. The rest of the matter we have already mentioned in our memorandum and I don't see much point in my going through it point by point, except that we would like to say that our association feels that Justice Iyengar's Report was a very comprehensive one and no doubt the Committee will take full note of this. That is all that I have to say at the moment unless there are questions from Hon'ble Members.

Shri R. P. Sinha: I would like to seek one or two clarifications from

the witnesses. I understand that the pharmacists who are members of this association are actually carrying on research in the pharmaceutical field.

Shri K. C. Chatterjee: Yes, Sir.

Shri R. P. Sinha: So you are the real people who make the real inventions. Am I correct?

Shri K. C. Chatterjee: There are two main types of pharmaceutical research that are going on in India just now. One is known as 'fundamental research' where attempts to discover completely new drugs are made. In this particular field, we have made very little progress, although some of our boys having worked under expert guidance particularly abroad have made a name. The other type of research is known as the 'product development research' which is going on in our country in various factories and I am an adviser to this particular side of research. And I would say that we have made a good deal of progress in this particular field. May I just clarify what I mean by 'product development? It is the conversion of a chemical into a product suitable for human consumption. Let me give you an example. There is an antibiotic called "Griseofulvin". This is useful in fungus infection. When the first ointment was made, it was found to be comparatively useless because it was not properly absorbed. Then the formulation had to be changed and now "Griseofulvin is used with very good results. So it is the conversion of the basic substance into a pharmaceutical product suitable for various types of use that we have in mind. This is called "product development research" and this has advanced extremely well in India. Regarding "fundamental research"—trying to discover completely new substances—we have a large number of people who with proper training or with proper guidance will be excellent scientists, but at the moment, we do not have very many on this side.

There is another kind of research which is known as "molecular rearrangement"; that is, if somebody has discoverd already an organic chemical which is useful in medicine, then it is possible to alter this particular molecule to some extent and either to increase the activity or decrease the toxicity. Some advance has been made by our members in this field also. But I don't think we have made much progress in the field of original research which leads to discovery of completely new chemotherapeutic substances.

Shri R. P. Sinha: I would like to know how a patent law helps the pharmacists. What I mean is this, that we provide the patent so that the actual research worker should draw benefit from that. We understand that research workers are engaged by organisations, by companies and industries but the patent is not given to the man who actually does research and invents but is given to the company where he is employed. Now I would like to know how it benefits people like you who actually make the inventions. I understand that West Germany is the only country where the royalty is shared, that is a certain portion of the royalty is given by the employer to the research worker. How do you benefit in India? How are you paid? Unless a remuneration or reward or compensation is given to you, how will it work as an incentive to you to do more and more research?

Shri K. C. Chatterjee: Well, it was our hope that perhaps the Select Committee could help us in this. This has been a grouse of some of the workers in this industry....

Shri R. P. Sinha: You have not said anything about that to us. Will you explain as to how the Select Committee can help you in this matter? Will you explain as to how we can help so that more and more

unwittingly it becomes a drug for the purposes of this Act and suffers the same limitations applicable to drugs.

Dr. C. B. Singh: Phenol is used as a drug in itself for certain purposes. Benzene also is used as a drug.

Shri R. A. Shah: We are talking about the basic raw benzene, not tincture benzene; raw benzene is a petrochemical product.

Dr. C. B. Singh: About the period, are you quite clear in your mind that you do not want 14 years but 10 years with two extensions of 2 years each?

Shri S. H. Gursahani: If it is considered vital to make a distinction between drugs and other products, we would hold on to 10 years with two extensions of two years each.

Dr. C. B. Singh: About appeal, you have said that the appeal should be to a tribunal and highest appeal will be to the Supreme Court. Is that correct?

Shri S. H. Gursahani: We have suggested. rather than providing for appeals from Caeser to Caeser, it might instil more confidence in industrial property owners if there is a provision for appeal from the decisions of the Central Government or the Controller to a tribunal which might be independent of the department and which will look at the problem objectively and judiciously and not be hidebound by considerations of policy or executive action.

Mr. Chairman: You want that instead of appeals to the Central Government all appeals against the decisions of the Controller should go only to the tribunal and in the finai stage to the Supreme Court?

Shri S. H. Gursahani: That is correct. We agree to that.

Dr. C. B. Singh: Evidence has come before us to show that the distinction between process and product is artificial, that a process can produce many products and so many processes can produce so many products. Do you subscribe to this view? Do you want that there should be product patent or process patent?

Shri R. A. Shah: I think there is a lot of rationality and justification in not granting or not protecting products by themselves, and in the circumstances in which we operate in this country I think it would be adequate and reasonable if products which are made by particular processes are protected.

Dr. C. B. Singh: You are in favour of patent for product by a certain process and not in favour of process alo nor products alone.

Shri R. A. Shah: Yes.

Dr. C. B. Singh: What are your reasons for that?

Shri R. A. Shah: Otherwise there may be a tendency to import from abroad articles which are manufactured about and such imported articles would not constitute a breach of the patent law here. That would be an incentive to imports and a disincentive to import substitution.

श्री चौरडिया : आपने देखा होगा कि कई लोग पेटेंट लेने के लिए जितने भी सम्भावित प्रोसेस होते हैं उनको पेटेंट करवा लेते हैं । क्या कुछ प्रोसेस पेटेंट करवाने की व्यवस्था ठीक रहेगी या सभी सम्भवित प्रोसेस पेटेंट वे करवा सकते हैं, यह व्यवस्था ठीक रहेगी ?

Shri S. H. Gursahani: If the protection is afforded to a product manufatured by the patented process, then I appreciate the hon. Member's question, that this can probably be got over to some extent by the patent holders trying to patent as many processes as they can think of and in this way not only achieve the limited protection of product by a particular process, but products by themselves. But, at the

Shri R. P. Sinha: I would like to know from them.

Mr. Chairman: Have you got the figures as to what amount is being spent on research?

Shri K. C. Chatterjee: We cannot give the figures.

श्री चौरड़िया : आप ने अपने मैमोरेंडम के पेज 2 पर कहा है कि जब गवर्नमेंट किसीका पेटेन्ट राइट ले ले तो उस को कम्पेन्सेशन देना चाहिए। क्या आप इसमें वे परिस्थितियां भी शामिल करते हैं, जब डिफ़ैंस का मामला हो या राष्ट्र के हित का प्रश्न हो, आदि ? क्या आप चाहते हैं कि जब गवर्नमेंट जनता के हित में पेटेन्ट राइट ले ले, तब भी उसको कम्पेन्सेशन देना चाहिए ?

Shri K. C. Chatterjee: What we had in mind was that when there is an emergency, the question of compensation does not really come in, but under normal circumstances, we feel that for the development of the research and industry in the country. since there is already a provision of compulsory licensing, it does not seem necessary that this particular clause need be there.

श्री चौरड़िया : किसी को पेटेन्ट राइट दिये जाने पर शुरू शुरू में वह बहुत अधिक कीमत लते हैं। उदाहरण के लिए विटामिन बी–12 की कीमत शुरू शुरू में दो हज़ार रुपये प्रति ग्राम रही, जबकि बाद में वह मार्केट में 40 रुपये प्रति ग्राम के हिसाब से मिला। इसी प्रकार और भी कई आइटम्ज़ हैं। मैं उनका ज़िक्र नहीं करना चाहता हूं, क्योंकि आप उनको जानते हैं। क्या आप कोई सुझाव देंगे, जिससे कन्जयूमर को भी राहत मिले और इन्वेन्शन करने वाल का भी नुक्सान न हो ? क्या आप कोई उचित प्राइस निर्धारित करने के सम्बन्ध में कोई सुझाव देना चाहेंगे ?

Shri K. C. Chatterjee: Actually you notice that in our Memorandum we had selected only a few points where we have a complete agreement amongst our members. On matters touching the price and trade, if we do express any opinion here that will have to be regarded completely as our personal opinion because we have not got any brief from the Association on the points other than those that have been agreed upon. We have discussed this for many days and this is the greatest agreement that we have got amongst our members and our members felt it should be only these few points on which we should give any evidence. I am just wondering whether we could be excused in not answering many points.

श्री चौरड़िया : आप ने अपने मेमोरेंडम के पेज 3 पर अपील्ज़ के बारे में कहा है : "... वाई फ़िक्सिंग टाइम लिमिट्स फ़ार इट्स डिसिज़न्ज़ आन स्पैसिफ़िक मैटर्ज़"। जब अलग अलग प्रकार के कैसिज़ रहते हैं—किसी में टाइम ज्यादा लगता है और किसी में कम—, तो इस अवस्था में टाइम लिमिट फ़िक्स करना कैसे सम्भव है ?

Shri K. C. Chatterjee: Here we can only hope that it would be done expeditiously.

Mr. Chairman: You can give your personal views. Your Association may not have authorised you to give opinion on this. You are an expert.

Shri K. C. Chatterjee: On what point?

Mr. Chairman: On the previous point raised *i.e.* on the price question.

Shri K. C. Chatterjee: Will you repeat the question please?

श्री चौरड़िया : किसी को पेटेन्ट राइट दिये जाने पर शुरू शुरू में वह बहुत अधिक कीमत लेते हैं। उदाहरण के लिए विटामिन बी–12 की कीमत शुरू शुरू में दो हज़ार रुपये प्रति ग्राम रही, जब कि बाद में वह

मार्केट में 40 रुपये प्रति याम के हिसाब से बिका । इसी प्रकार और भी कई आइटम्ज हैं । मैं उनका जिक्र नहीं करना चाहता हूं, क्योंकि आप उनको जानते हैं । क्या आप कोई सुझाव देंगे, जिससे कन्ज्यूमर को भी राहत मिले और इन्वेन्शन करने वाले का भी नुक्सान न हो ? क्या आप कोई उचित कीमत निर्धारित करने के सम्बन्ध में कोई सुझाव देना चाहेंगे ?

Shri K. C. Chatterjee: As I have said, this will be my personal view. I do not think that there need be very great difficulty in Government taking some sort of power to look into the cost and productin problems.

Shri Peter Alvares: My suggestion is personal view may not be insisted upon. After all he is a representative of the Association.

Mr. Chairman: Why not? He is an expert.

Shri R. P. Sinha: I would like to make a statement. These two witnesses represent certain Association but they are, in their own right, great experts in this field. Sir, Mr. Banerjee represents one of the biggest foreign concerns where (we are told he is working in the capacity of probably Joint Managing Director) no patent products are manufactured. This is what he told us when we visited the factory. My knowledge is this, he is one of the most respected men in the profession. I would request you after everybody has put questions to give me one more oppportunity to put questions, and I would request Mr. Banerjee to answer my questions to enable us to find solutions of the various problems that we are facing in this committee. He can do so in his personal capacity.

Shri V. M. Chordia: You have mentioned in your Memorandum that some clauses should be amended in accordance with the recommendations made by Justice Ayyangar. Do you have some differences with that report also?

Shri K. C. Chatterjee: This is again a personal question.

Shri V. M. Chordia: You have come here as a witness.

Mr. Chairman: You may say it is my personal opinion.

Shri K. C. Chatterjee: Well, we do not agree with everything that has been said in the report. But, on the other hand, if you ask me about the points on which we do not agree, I am afraid I personally am not prepared. I must excuse myself by saying that I was not supposed to be leading this deputation.

Shri V. M. Chordia: You must have seen the Indian Pharmaceutical Association's report, addressed by Shri Rohit. You have given there a schedule, Annexure V, in which you have given gross profit and other figures also. Can you give us some figures as to what percentage is spent on advertisement and what percentage is spent on research?

Shri K. C. Chatterjee: I personally cannot. I will request Mr. Banerjee to answer that question.

Dr. J. N. Banerjee: I am afraid the industrial point of view, as Mr. Chatterjee has said is not represented by the Association, and I am unable to answer this question.

Shri B. K. Das: I find from your Memorandum that in some cases you want that there should be a provision for compensation. I want to know what should be the basis of that compensation, if it is at all conceived.

Shri K. C. Chatterjee: Our idea was that normally when there is compulsory licence there should be no distinction made between the Government and the rest of the community.

Shri B. K. Das: There should be a provision of compensation and there

should be some basis. That was my point.

Shri K. C. Chatterjee: The basis should be exactly the same as compulsory licensing to any other party outside.

Shri B. K. Das: But here there is a provision for royalty of 4 per cent. Do you agree to that amount? That is the ceiling we have put there.

Shri K. C. Chatterjee: Well, this was a matter which was discussed by our Association and we felt that as scientists are wanting to fall in line with the Government it should be our endeavour to agree to this. We had a number of our members who pointed out that it may not always be possible to get a patent at this particular price. This, I am afraid, is one of the most debatable points and we had amongst ourselves difference of opinion on this. In general, we felt that if a businessman really wanted a good patent and if he had to pay to be able to procure this, as is done in Japan, I am told, he will only pay a higher amount if it is worthwhile for him. Perhaps this particular ceiling may act against the country. But, then, again the opinion in our Association is divided on this. That was the reason why we have not put it forecfully in our memorandum.

Shri Shyamnandan Mishra: There is no need to embarrass them any further.

Sardar Daljit Singh: I want to know whether you agree with the opinion given by Justice Ayyangar.

Mr. Chairman: He said so. They agree with the recommendations of the Ayyangar Report.

Sardar Daljit Singh: One thing more. The Development Council, after taking into consideration all the facts affecting Indian production suggested that the local manufacturers should not pay more than 60 per cent above the c.i.f. price. I want to know your opinion. Do you agree to this suggestion?

Shri K. C. Chatterjee: This is again a matter of personal opinion, because we have not discussed this issue in our Association. At the moment, whenever a manufacturer starts making any basic manufacture, he has been procuring the raw-materials, as far as possible, from the country, and in most cases he has been paying very much more than 60 per cent for his raw-materials. Quite often, it becomes almost impossible to meet this particular ceiling the Development Council thought of at one time. This is my personal experience with some of the companies I am associated with as adviser.

श्री ब्रज बिहारी मेहरोत्रा : नये नये आविष्कार होते रहते हैं । मैं यह जानना चाहता हूं कि आविष्कारक को उचित लाभ भी प्राप्त होता रहे और साथ ही जन-साधारण को लाइफ़-सेविंग ड्रग्स और दूसरी मेडिसिंज़ मॉडरेट प्राइस पर मिलती रहें, इन दोनों उद्देश्यों की पूर्ति के लिए आप पेटेन्ट की क्या अवधि रखना चाहते हैं ।

Shri K. C. Chatterjee: I think, in a way, we have answered this question. Again, that is my personal opinion. The Association will be quite happy to accept ten years unless there are legal difficulties, in which case we would like no distinction made between a pure chemical and a pharmaceutical, because a pure chemical is quite often a pharmaceutical also.

श्री ब्रज बिहारी मेहरोत्रा : क्या ऐसा प्रतिबन्ध लगा देने से विदेशों में होने वाले आविष्कारों से हमारे देश को लाभ पहुंचने में अड़चन नहीं आयेगी ? क्या आप कोई ऐसा सुझाव देंगे, जिस से हम दूसरे देशों में होने वाले आविष्कारों से लाभ उठा सकें और साथ ही आविष्कार करने वालों को भी इन्सेन्टिव मिले ?

Dr. J. N. Banerjee: We have said this in a very general manner in our memorandum that this is affected by a number of clauses in the Patents Bill proposed—period of patent, question of royalty etc. In general, what we said is that the atmosphere should be conducive so that the Indian entrepreneur should be in a position to buy the know-how or the patent for exploitation in the country. He should be in a position to pay whatever royalty he has to. There are a number of things which really affect this.

श्री ब्रज बिहारी मेहरोत्रा : अब तक जितने भी पेटेन्ट्स हुए हैं, उनमें नब्बे परसेंट विदेशियों द्वारा लिये गये हैं और उनमें अधिकतर ऐसे हैं, जिन का प्राडक्शन यहां नहीं होता है और जो बाहर से इम्पोर्ट किये जाते हैं। क्या आप इस स्थिति में सुधार लाने के लिए कोई सुझाव देना चाहेंगे ?

Dr. J. N. Banerjee: This is a question of general development of the pharmaceutical industry in the country. There are not only patents which are not exploited in the country. There are a large number of drugs on which there are no patents, which are not manufactured in the country. That is more because of lack of technical know-how? It is really the industrial base of the country which has to be improved.

श्री ब्रज बिहारी मेहरोत्रा जिन चीजों का पेटेन्ट लिया जाता है, उनकी तरफ लोगों का आकर्षण एक दम से बढ़ जाता है, जब कि जिन चीजों क पेटेन्ट नहीं लिया जाता है, उनको लोग इग्नोर करते हैं। क्या यह बात सही है ?

Dr. J. N. Banerjee: I could not answer the question.

Shri Kashi Ram Gupta: Are inventions these days the result of individual scientist's effort or collective effort of more than one scientist?

Shri K. C. Chatterjee: I shall have to go back to some of the points that I have touched before.

If you are talking about fundamental research leading to the development of a chemotherapeutic drug, then it is a complete team work, and this teamwork so far has been tried in Government institutions in various countries without conspicuous success. So far, it is the development of industrial research which has produced anything in the way of fundamental chemotherapy which is worthwhile. This organisation is normally a very huge one, so much so it may have to produce something like seven to eight thousand drugs of which one may be of some use. Then there is the other part, where the basis substance which somebody has discovered is altered slightly to make a different drug which gives some benefit perhaps in activity or lessening of toxicity. This work can be done by individual chemists. The third type, product development, can be done by a very small team. It does need a team, but a small team.

Shri Kashi Ram Gupta: May I conclude then that so far as fundamental research is concerned, as the expenses are heavy, the individual scientist is not in a position to do much there?

Shri K. C. Chatterjee: You are correct.

Shri Kashi Ram Gupta: Since basic research has to be done in an organised way either by Government or big industries, and applied research can be done on a smaller scale, may I conclude that when somebody applies for a patent it is for product research and that basic research has been done somewhere else?

Shri K. C. Chatterjee: That will depend on how the patent has been covered. Some patents are covered by the basic substance as well as all products thereof. There are some where patent is taken merely on the fundamental chemicals.

Shri Kashi Ram Gupta: In this Bill, the process leading to a product is to be patented, not the product itself.

Shri K. C. Chatterjee: I think we are slightly confusing the matter. Let us take the concrete case of sulphathiazol. If I am taking a product patent, whichever way you make it, it is covered by the patent, so that, starting from sulphathiazol, other researches that come up would not be covered by this patent at all. Our scientists would be free to take sulphathiazol and convert it into other products, and those will not be covered.

Shri Kashi Ram Gupta: Is it a fact that most of our scientists employed by organised industries are remunerated in bulk and not on a percentage basis, in addition to their pay, for their inventions?

Dr. J. N. Banerjee: It differs from company to company. I have no experience of this.

Shri Kashi Ram Gupta: You have said that a ten year period will be generally sufficient. May I know whether it is from the date of completion of the specification as provided in the Bill or from the date of the grant of the patent? I want to know whether you have considered it.

Shri K. C. Chatterjee: It is from the date of completion of the specification.

Shri Kashi Ram Gupta: My last question is this. Has your Association been able to consider the clause on revocation or was there any difference of opinion on it?

Shri K. C. Chatterjee: Anything that we have not mentioned here are such controversial matters that we would rather not refer to them.

Dr. C. B. Singh: I suppose Mr. Banerjee is a scientist.

Dr. J. N. Banerjee: I started my life as a scientist and I am now in the capacity of a Joint Managing Director. The research department is under me. But I cannot say that I am purely a scientist now.

Dr. C. B. Singh: All right. Now, during the last 15 years, when we see the list of new single chemical entities discovered during the last 15 years in various countries, we find that the number is 355 in USA, 38 in Switzerland, 28 in UK, one in Italy and one in India. Now, could you please tell us why, in spite of such a large number of talents in India—you have mentioned that there are 4000 pharmacists in India who are doing good work—the number of single product patented or discovered is only one, as compared to round about 355 in the USA?

Shri K. C. Chatterjee: India has come out with one drug that has come out from Hindustan Antibiotics, where we have a sizeable research department. That department does compare reasonably favourably with the research departments I have seen elsewhere in the world.

Dr. C. B. Singh: You are more or less at the top of this firm as well. So, may I know from you what is the amount of money that you are spending on research at the moment, taking your turnover into account?

Shri K. C. Chatterjee: I personally can only hazard a guess. In the research laboratories that I am associated with as adviser to various companies, I would say that in the middle-sized companies where I am adviser, it is no more than about one and a half per cent. I am only expressing my personal opinion.

Dr. C. B. Singh: Yesterday we were told by a very eminent gentleman that it is almost a drop: not even 0.1 per cent.

Shri K. C. Chatterjee: My own experience has been with the companies that were in difficulties.

Dr. C. B. Singh: A very important question today is this: out of a large number of products which are being processed by the pharmaceutical firms, what is the proportion of patented drugs to unpatented drugs, and what is the percentage?

Shri K. C. Chatterjee: If you are talking about the number, then, I think it is not very significant, but if it comes to the amount involved..

Dr. C. B. Singh: I am talking about the number of patented drugs being sold out and the number of unpatented drugs. I want you to tell us, as a pharmacist, what is the proportion of the patented drugs that you are selling in the market as compared to the unpatented drugs.

Shri K. C. Chatterjee: About 80 per cent will be unpatented.

Dr. C. B. Singh: I am talking about the number, not the money. Is it not greater in number?

Shri K. C. Chatterjee: It may be more.

Dr. C. B. Singh: The greater part of the processes that you are putting in the market is unpatented. Is that correct?

Shri K. C. Chatterjee: Yes.

Dr. C. B. Singh: You have said that the pharmacists wanted help. What will you suggest? Will you suggest that we could put down a compulsory expenditure on research on the sale outturn of the company so that they will be bound down by a schedule that they will spend so much money on research?

Dr. J. N. Banerjee: The companies have to exist more or less upon the product of their original research, and so, the companies must bring out more and more new drugs and they would have to spend a large amount of money on research. But by compulsion, I do not know how far we will be able to force the pharmaceutical industry to spend. It depends upon various companies.

Dr. C. B. Singh: You know that they are not doing it and you are aware of it. I am asking the question whether something can be done so that they will be compulsorily bound down to spend money on research. I know it depends upon the directors of the firm.

Shri K. C. Chatterjee: Here again, the Association would like to see it done, but I do not think we can suggest how it can be done or what should be the specific method.

Dr. C. B. Singh: In some countries they are spending about 5 to 10 per cent of their outturn on research, and some countries are spending more than that. Would you like to suggest something?

Dr. J. N. Banerjee: The first thing today in India to do is to establish a pharmaceutical industry where our needs are met. We may not be able to start running them just now. We might be able to accept things which have been discovered in other parts of the country. We are miles and miles and years and years behind other countries. Let us buy those which are already available and then start making our own research.

Dr. C. B. Singh: You have been doing nothing but copying others all these years. You still want to perpetuate that copying?

Dr. J. N. Banerjee: Only a few years ago our pharmaceutical industry started. Let us make those drugs which our country needs today and then from that basis let us proceed, because the industry can spend on research only when they have sufficient profit which they can plough back into their research organisation. Unless the outturn is high, you cannot force anyone to do research by compulsion.

Dr. C. B. Singh: You are speaking as Director of the company; not as a scientist. Thank you.

Shri Babubhai M. Chinai: The witness has said that they would be satisfied with a period of 10 years for a patent. They have themselves said that they represent only the research employers in their individual capacity on this association. May I know whether their view as individuals is shared by the pharmaceutical industries as such? Even 16 years, according to some of them is not sufficient, because the initial 6 or 7 years are taken away in primary research and by the time they come with a definite proposal, the period left is very short. So, is your view shared by the industry as such.

Shri K. C. Chatterjee: No; industry would like a longer period.

Shri Babubhai M. Chinai: If that is so and if it is the industry which will be paying the research scholars, how is it that you express a view which is contrary to theirs?

Shri K. C. Chatterjee: A large number among us are holding high positions in various industries and we hope to persuade them.

Shri Babubhai M. Chinai: Persuasion comes afterwards. The question is whether it is really practicable.

Shri K. C. Chatterjee: The industry says in certain cases it takes a very long time before a patent can be exploited. If the Government agrees to that proviso, then we have no objection.

Shri Babubhai M. Chinai: Regarding clauses 99, 100 and 102, you say it is unfair that the public sector companies or Government departments should have the patent free. Is this observation of yours based on the Constitution of India which says that Government has no right to take away anybody's property free and compensation should be paid?

Shri K. C. Chatterjee: We were not thinking about the Constitution. We were thinking that if you are going to have a patent system, the protection should be there.

Shri Babubhai M. Chinai: You have said that only 1 per cent of the turnover will be spent on research. We are very badly in need of research to bring down the cost of production so that apart from local consumption, we can export our products. So, don't you think there should be more spending on research and if necessary Government should give some incentive for more research so that ultimately the Government and the people will be benefited?

Shri K. C. Chatterjee: There is no doubt about the need for more money and efforts going into research. How to ensure it, I am afraid we have not been able to come to any decision about that.

Shri P. K. Kumaran: In your memorandum you say that in developing countries, a judicious compromise should be made between effective patent protection and measures to safeguard against possible abuse of such protection, etc. Will you elaborate what you mean by judicious compromise?

Shri K. C. Chatterjee: I mean the sort of thing the Bill wants to do. Compulsory licensing is one such compromise. The provision regarding royalties is another.

Shri P. K. Kumaran: So, on the important points, you consider the Bill is a judicious compromise?

Mr. Chairman: They agree that it is so.

Shri P. K. Kumaran: They object to clause 95(3).

Mr. Chairman: They say when there is an emergency they agree to it.

Shri P. K. Kumaran: If the drugs which we require are available in the

country only at a very high cost and if Government decides to import it, will they object?

Shri K. C. Chatterjee: If there is no emergency and merely because a product is available outside at a cheaper price than in the country the Government wants to import it, our association would object to it. We would rather wish that the Government forces the industry to make it in India at a cheaper cost by giving it all incentives and help. Otherwise, the Indian industry will be hampered.

Shri P. K. Kumaran: Then why do you object to clauses 99, 100 and 102 which give the Government undertakings the right to exploit the patent?

Shri K. C. Chatterjee: Compulsory licensing is there and we have no objection to it. We are in favour of manufacturing any product in India.

Shri P. K. Kumaran: You are in favour of Government being vested with extra powers to force the industry to manufacture it here?

Shri K. C. Chatterjee: Yes.

Shri Dalpat Singh: In your view, should the time for a patent be the same or different in the developing countries and in the developed countries? What are your reasons?

Shri K. C. Chatterjee: I think one of the problems of all developing countries is that technologically it takes them considerably more time to put a product in the market. After the chemist has finished his job, the clinical assessment has to be made. Simultaneously with it, the technological aspect of large-scale manufacture will have to be considered. In both these two fields, at the moment, our country has not made very great advance. Comprehensive clinical trials, in a sense, that is necessary for drug research is not there in our country. It does take at least three years before we can make any assessment. Similarly, it is not enough to design a plant. We need first to develop not only the laboratory method but a method for manufacture. Having done that we need chemical engineers to design the equipment. When they have designed that, it takes a very long time to get delivery of the plant. To give you an example, for reaction tanks, orders placed on even very well equipped firms will not take anything less than two years. Therefore, in a developing country it is not easy to exploit a patent quickly. In the United Kingdom, about which I have some experience, there are certain plants which are called multi-purpose plants. Drugs are coming in one by one and becoming obsolete. Therefore, it is necessary that the research work done, is exploited very quickly. They have certain plants which with certain adjustments can within a period of a month take up an entirely new chemical substance. On that basis, it will be my submission that a developed country need not have a very large number of years. Supposing we want to say that it is reasonable to expect a research to be exploited in a period of 7 to 8 years, by giving just a year or two extra perhaps a developed country may be able to do that, but our country will take an additional three or four years in the beginning to be able to put anything in the market.

Shri A. T. Sarma: You have stated in the concluding paragraph of your memorandum that certain clauses are to be amended according to the recommendations of Justice Ayyangar. Will you enlighten us by giving three or four concrete instances?

Dr. J. N. Banerjee: We do see that there are a number of things in the present Bill which are contrary to the recommendations of Justice Ayyangar. The general feeling in our Council was that Justice Ayyangar's report was based on a very thorough study of the subject and therefore it should receive full consideration of the Committee. There is, for example, clause 2(h) about tne definition of "public undertaking". Jus-

tice Ayyangar nas said that the definition should be restricted and it should not include organisations like the CSIR. We see that the definition as given in the present Bill is rather wide and is contrary to what Justice Ayyangar has said in his report. There is also the clause relating to royalty. Although the considered view of a majority of members of the Council was that 4 per cent is all right, there is another view that if you place a ceiling on royalty it might hit the interests of a genuine Indian entrepreneur. Supposing there is a certain process which a certain foreign company has, a truly Indian company in order to make this process more economic would not be able to have it because, after all, you cannot force anybody to part with his property unless he is given the price he wants for it. The amount of royalty compared to the total cost of production is not much and, therefore, my feeling is that we should not put a ceiling which will truly put an Indian entrepreneur at a disadvantage. There are other means by which the Government can put a ceiling. There are other clauses like appeals etc., where we have said that it should be judicial appeal. We have also said that there should be screening of pharmaceutical manufactures in a more vigorous way to see that a man is really competent to do the job and make standerd drugs etc.

Shri K. V. Venkatachalam: Is your organisation the only organisation representing pharmaceutical dealers in India or is there any other organisation?

Shri K. C. Chatterjee: There are chemists and druggists associations, there are hospital associations, pharmacists association etc. But the slant in almost every case is towards trade union activities. A large number of these associations are members of our organisation as well. So we have tried to keep the trade union activities as far out as possible. We cannot claim that we are the only organisation, but I think we can claim that we are the only academic sort of organisation.

Shri K. V. Venkatachalam: Could you say that your membership includes quite the large majority of the people who are in this field?

Shri K. C. Chatterjee: I think we can say so.

Shri K. V. Venkatachalam: From that point of view, I think the Joint Committee will attach the greatest importance to any evidence that you might give to the Committee. I would like to ask one or two general questions. Even if you are not able to answer them from the point of view of the Association as such, if you could answer them in your personal capacity, it would be valuable to the Committee. First, what is your own impression about the amount of money spent on research? You were saying that it is not adequate. But is any money spent on research at all now?

Shri K. C. Chatterjee: CIBA Research Centre is the only one which has done something in an organised way. Bengal Immunity Research Centre is also reasonably well organised. Apart from them, I personally think that we do not have any research organisation of the type we require.

Shri K. V. Venkatachalam: You were mentioning three types of research—basic fundamental research, molecular changes and product development.

Shri K. C. Chatterjee: Product development is done in all medium-sized factories. I am not suggesting that is not important, but that part of the research which is money-consuming is done, as far as I know—I may be wrong—only in two centres, namely, CIBA and Bengal Immunity.

Shri K. V. Venkatachalam: What about public sector factories?

Shri K. C. Chatterjee: I am very much impressed with the research that is being carried out at Pimpri. I

think they have got a very good research centre. That is the type of research that should be done. So far as the national laboratories are concerned, if we compare them with what is being done outside India, they are not doing anything at all.

Shri K. V. Venkatachalam: What is your own impression about the development of pharmaceutical industry in India during the last ten years? Are they making merely formulations or does it go down to more basic levels?

Shri K. C. Chatterjee: We have made tremendous strides; there is no doubt about that. My own impression is that we are doing extremely well. I would like to see the production costs going down. But when I raise this point I am told that the prices of raw materials have gone up.

Shri K. V. Venkatachalam: Quite an amount of evidence has been given before the Joint Committee that the total effect of this Bill, when it becomes law, would be to retard the development of pharmaceutical industry. The intention of patents in the final reckoning is to produce more good quality products. So, what is your own view about the effect of this Bill?

Shri K. C. Chatterjee: Except for the ceiling on royalty that you have put down, which might cause some difficulties, I personally do not think that it will retard progress.

Shri R. P. Sinha: The prices charged by the industry for patent drugs are very high and the reason given is that they have got to meet the cost of research. It is true that the community has got to meet the cost of research. At the same time, the prices of life-saving or health-giving drugs should not be unreasonably high. Since Sandoz would be making a reasonable profit on their investments, I would like to know from Dr. Banerjee as he is running a model liaboratory whether the profitability in patent drugs today is unreasonably high and, if so, whether some steps should be taken through the medium of the Patent Bill to bring down the profitability without affecting the research on drugs.

Dr. J. N. Banerjee: We are now discussing the Patent Bill and I think cost does not come within the purview of the Patent Bill which you are considering. You would agree that research costs a lot of money in the laboratories and that the few products which come out of the laboratories should bear the cost of research. I could not say what is reasonable profit. I am sure the Government have got adequate powers already to control the prices, outside the purview of the Patent Bill. Above all, there is competition. So, the best way to control the price is to have free trade. Let a number of companies make the same drug. I am sure competition will ensure that prices of drugs come down. Even today in the pharmaceutical industry there is a lot of competition. If some company comes out with a new drug, it does not mean that it has a monopoly. Another company could make a drug of that class. Then, the cost of the drug has something to do with the cost of raw materials, cost of energy etc. Because of these, the cost of even unpatented drugs is higher in India.

Dr. C. B. Singh: The Government of India is spending Rs. 30 lakhs to Rs. 35 lakhs on the Central Drug Research Institute, Lucknow, which has a good laboratory and other facilities. Has CDRI been able to make any new drugs?

Shri K. C. Chatterjee: As far as I am aware, no orignial drug has come out of CDRI.

Dr. C. B. Singh: You are representing a very important organisation and probably you are keeping in touch with what the CDRI is doing. Have you any idea of the problems on which they are working in the CDRI?

Shri K. C. Chatterjee: Not recently.

Mr. Chairman: We will try to visit that.

Shri Borkar: As you have represented, drug inventions have got a special significance to us. Unlike other inventions, where the invention is the property of an individual and the experiments are confined to the precincts of a room, in the case of drug research you have to go out into the field to the hospitals, and carry out clinical trials, maybe, on thousands of patients, before you market a drug. In that sense a large number of patients on which the drug is tried out participate in your research. Unless you give something back to these people, you will not have done your duty by those people. In this context do you not think that the patents of drugs should be a special consideration on the part of researchers and firms who do research? Although you say that the question of prices is separate but it does have a bearing on prices, to the extent that medical people and patients participate in research. So, should you not give anything back to them in the shape of reduced cost of drugs?

Shri K. C. Chaterjee: I must say that this is a new angle that has not occurred to me before. I have a feeling that Dr. Banerjee has answered your question by saying that at the moment we are concerned with how to make things in India and how best we can make them. As regards price fixation, really, the Government has the power to guide the industry and to force us also. There should not be any reason why this costing should not be available to Government for inspection for fixing a reasonable margin of profit to the people who are manufacturing them. But I cannot see how people who have been unknowingly co-operating with us in the clinical trials could get a fairly direct benefit —in a general way, yes; but, there again, I think, the best possible remedy would be for the Government not to let the industry make too much profits.

Mr. Chairman: Thank you very much, gentlemen.

The witnesses then withdrew.

II. Bundesverband Der Pharmazeutischen & Industry E.V., Frankfurt Am Main, West Germany.

Spokesmen:

(1) Mr. Curt Engelhorr. President.

(2) Dr. Scholl, Adviser.

(The witnesses were called in and they took their seats)

Mr. Chairman: Gentlemen, the evidence that you give is public. It will be printed and distributed to all our Members and will also be laid on the Table of Parliament. Even if you want anything to be treated as confidential, it will be printed and distributed to our Members.

We have received your memorandum and it has been circulated to all the Members. If you want to stress any particular point or wish to make any new point, you may kindly do so. After that our Members will ask you some questions.

Mr. Curt Engelhorn: Mr. Chairman and hon. Members, it is a privilege for us to be able to present our views to this Committee. We have come all the way from Germany since we consider your task a very important one. Please accept our observations as sign of co-operation and interest in the welfare and development of your nation.

I would first like to introduce myself. My name is Curt Engelhorn. I am President of the German Phamaceutical Manufacturers' Association. I am also President of the C. F. Boehringer & Sons, Mannheim, Germany. I have brought with me Dr. Scholl,

who is Secretary of the Association and a specialist in German patent law. He will be able to answer or help me answer detailed questions in regard to the German patent law.

As far as our Association is concerned, it has 657 member-companies. These 657 companies account for 95 per cent of the production of pharmaceuticals in Germany. I can say that our Association is highly respected and that it is heard by our Government as well as the governments of the Common Market countries for the preparation of important legislation.

Next I would like to point out that we are very much impressed by the parliamentary procedure that is followed in this country. We have the feeling that a fair hearing is given to many different parties and we have the feeling that this does justice to the complications and the complicated side of this subject you have under consideration. Knowledge, of course, of all these many sides leads to responsibility and we admire that this responsibility is not being evaded. We consider this type of hearing an important and possibly unique precedent.

Now, I would like to point out to the hon. Committee the three Roots from which my interest, in this case, stems. The first is an interest in your country which goes back to a very close friendship which I formed with one of your countrymen when we went to the University together. The second is a joint venture which my company formed with Indian partners in Bombay. In this joint venture, we are producing drugs and we are producing one very important drug chlorophenicol, Prospectrus Anti-Biotics, a board spectrum Anti-Biotics in considerable volume. The third root is an old interest and friendship that exists between Germany and India. I do not have to go into details. I believe, you are aware of some of these aspects that go back many many decades or even centuries.

The steady progress which your country is making is being watched with sympathy and admiration in my country. We realise that the problems you are faced with are mountainous or, to use an Indian express which is even more appropriate, Himalayan. Your determination to solve these problems democratically finds our admiration. The co-operation between India and Germany has grown tremendously over the years and we believe that it should grow further. Gradually, an inter-dependence between our countries in certain aspects is developing and we believe in view of such relations, important policy decisions are observed closely since the effect of such decisions go beyond the material plane. They form the basis of future co-operation and Germany wishes India to progress and prosper.

We feel that in this particular issue of patent legislation there are similarities in the situation we have faced in the past and the situation that you are facing today. A similar or identical approach to the solution of these problems would, of course, help mutual understanding. We also hope that our observations may contribute something in helping you to solve your problems. This, of course, has an influence on the general attitude in regard to the readiness to invest money in a country or to start any sort of enterprise.

The Patents Bill you adopt will have much to do with economic advancement of India. Many studies show that the fundamental approach cannot be different between developed and developing nations. I believe the root for that is that research is international, more so than almost any other human activity. Specially, the research in natural sciences, in engineering and in medicine is of that type. Therefore, the research utilisation and the protection of certain fruits of research is an international problem. This is demonstrated by the fact that the United Nations have given considerable attention to this problem. There is a so-called BIRPI

model law for under-developed nations in order to provide guide-lines for such laws in such countries. The Paris Union exists as a BASIS for countries which have patent laws which differ in details but which all adhere to certain principles. It was interesting for us to see that even countries like Russia joined the Paris Union. Then, there is the draft of the European Patent Convention, an attempt to coordinate European Patent law as closely as possible so as to make the flow of ideas back and forth even more easy.

We would like to report on the German experience. This, after all, is what we know most about. As you well know, the last War was a tremendous stain on Germany's economy. When the War was over, most of our production facilities were destroyed. I remember very distinctly, at the time I was still very young, I could hardly imagine that this could ever be rebuilt. The patents were confiscated by the Allied Nations that had been fighting against Germany and these patents were the German intellectual property. One aspect to that I find quite interesting is that even though the patents became free and anybody could use German patents outside Germany, the Allied Nations did not get much out of that. It so happened that using other people's ideas and other people's inventions without any contact with the original inventor did not seem to turn out to be a good proposition.

Then, we came into the reconstruction phase after we went through the devaluation of our money at 10:1, that is, for 10 Reichs Marks which we had at the time, we got 1 D.M. After this devaluation, the reconstruction we ahead at a much more rapid pace. I would like to give you a few figures here. In 1953, the gross national product was 147 billion D.M. and in 1965 it had grown to 448 billion D.M. But, I think, the figure in regard to exports is even more interesting. In 1950, the exports were to the tune of 8.3 billion D.M. and they grew in 1965 to 71.6 billion D.M., that is, about 9 times as much.

Germany has maintained its patent system in spite of the fact that German patents were not recognised in almost any other country. We see now that this was a wise decision. At the time, it was controversial and the idea of retaliation by not recognising foreign patents in Germany, of course, played an important part. It was realised, however, that, by not recognising foreign patents, we would not get any support, any positive attitude, of foreigners who could help us. Our state was very difficult inasmuch as we had had a very high level of research before the War. But so much went into the Defence effort and so much was completely interrupted by the War that the 10 years between 1939 and 1949 or 1950 threw us back very considerably. We had to find connection again with international research. In order to accomplish that, it was decided to keep the patent law and continue to give full protection to foreigners, and free use of taking of licences was made. The result was a considerable outflow of royalties. I can tell you that we are spending more in royalties than what we are taking in. We have the exact figures with us and we can give them to you.

The German patent law, I would like to highlight quickly, has a number of provisions that, I think, are of interest to you. The protection that we give in the German patent law to the inventor lasts for 18 years.

Mr. Chairman: From which date?

Mr. Curt Engelhorn: From the date of application.

Now the question arose in connection with the Kefauver hearings in the United States whether there should be a change, whether the term of patents pertaining to drugs should be shortened. There were two reasons why no such step was taken seriously. One of them was one of principle. It was felt that one cannot

discriminate between different categories of research or invention. The second was that it was considered of little consequence whether the duration of patent protection was 18 or 20 or 16 or 14 years and in order to really make a difference, one would have to cut down the duration of any particular group of patents very much and this, it was felt, was not warranted. I believe, however, that giving adequate protection to the inventor played a very important part. In Germany we have the institution of product by process protection. This means that, in the case of chemical inventions, the processes are protected by patents and with it also the product produced by such processes. It is important to point out, however, that with this type of protection, it is very difficult for the inventor to prove that anybody else is infringing his patent rights. For this reason, a reversal of burden of proof is provided for in the German patent law. In fact, the protection in Germany is very strong; it can be compared almost to the amount of protection that is given in the United States. Thirdly, as far as importation is concerned, the importation of drugs or products that are patented is considered an infringement of the patent.

An infringement of the patent is not a matter that is taken lightly in Germany. Infringement is a criminal offence.

In regard to compulsory licences, there are provisions in the German patent law. They pertain to public interest. If the Government thinks it necessary in public interest, it can issue a compulsory licence. However, there are two aspects that have to be mentioned. Compulsory licence includes the duty to compensate the inventor and secondly, full recourse is given to courts. An inventor can appeal to courts through all the three stages; he can go upto the Supreme Court. The courts ask "public interest" to be defined very exactly; no loose definition is accepted by courts. In fact, no compulsory licence has been issued since the War. It is also provided that a compulsory licence can pertain only to the manufacture and not to the importation of any such product.

An institution like "licences of right" does not exist in the German patent law. As I understand it, "licences of right" mean that any one can apply for a licence; that he does not have to prove whether he is able to work it or does not have to stand up to certain other criteria. In Germany this is not so. First of all, the public interest has to be proven and secondly there are also such things as the ability of the applicant to work the patent, the ability of the applicant to pay a commensurate royalty, etc. In the German patent law, no ceiling for royalties is provided for. Royalties are generally agreed upon freely between the parties. In the case of compulsory licences, the court will fix the royalty, but again the patent holder has the opportunity to appeal.

Patents generally, according to German law, cannot be revoked. There is, however, a provision for temporary suspension of the patent in the interest of public welfare. But this clause has never been used. The idea behind it is that, if there should be an epidemic, for instance, and the German drug production would be insufficient to cover the needs, then the Government would suspend the patent temporarily for the period of emergency and be free to import the patented drug by payment of reasonable compensation.

I would now like to come to a close and short summary. It is our feeling that research is international and that protection of intellectual property is, therefore, of great importance for international economic relations. The more we handle such questions internationally, the more there will be the flow of information and co-operation. We also hope, of course, that the continued development of this country will go on. We foresee a time and a day when inventions of importance,

of great importance possibly, will be made in this country and we believe that the inventors of this country will then be grateful for clear and strictly applied patent laws in other countries. Clear laws and regulations do provide a basis of confidence. I think this is important for international relations in general.

Thank you very much Mr. Chairman and hon'ble Members for listening to me. I am now open for questions.

Dr. L. M. Singhvi: In particular I would like to know what provision is there in your country in regard to licensing by right available to the patentee?

Mr. Chairman: It is not there—he said.

Dr. L. M. Singhvi: It is in the statement submitted to us and circulated by the Secretariat that in Germany there is a provision under which a patentee can apply to be marked as a licences of right. What is this provision?

Mr. Curt Engelhorn: I have a written answer to this. I am not a patent expert. So I have to look it up. So, please excuse me.

I will read out the question:

Can you say that according to German Patent Law any patentee by a declaration to be published and registered may permit another person to use his patented invention subject to adequate compensation?

Now this question is somewhat different from yours. But this is the closest provision there exists akin to something like a licence of right.

The answer to this is Art. 14 of the German Patent Law which refers to the so-called declaration and the willingness of the patentee to grant licence to anybody against adequate compensation. This declaration is published and registered. Afterwards only one-half of the annuities is to be paid by the patentee. This possibility according to Clause 14 is practically never used by bigger industrial firms, but single inventors and small companies who have no possibility to produce or utilise the invention in any other way and who at the same time want to save money, sometimes make use of this clause. They wish to invite as many licensees as possible. Declarations according to Art. 14 during the period 1950—64 were 10,830 patents and in 1965 there were 8,000 patents. We have no particular experience ourselves as to what the results of these declarations are. It must be kept in mind, however, that such a declaration is completely voluntary. Nobody can force the patentee to make this declaration.

Furthermore, the royalty to be agreed upon is not fixed beforehand but must be negotiated between the parties. In our opinion, Art. 14 of the German Patent Law cannot be compared to anything like a licence of right.

Dr. L. M. Singhvi: In your memorandum you have said that there is only process protection in Germany but that there is a provision under consideration for patent protection of the product also. What is this provision and why is this thing being considered now? At what stage of consideration is this provision of the patent protection of the product?

Mr. Curt Engelhorn: As far as I know—Dr. Scholl has more details about that—the situation is that the process protection presents considerable problems. One of the problems is that in order to get adequate protection the inventor has to study very many different processes. After all in chemistry, once you synthesise a valuable product, it is the value of the product that is of importance. It is particularly so in the pharmaceutical field. Now any educated chemist can devise a process around a single patented one. So all the investigations the inventor has made in the development of this product and

testing it pharmacologically, texicologically and clinically and so on, would have come to nothing if you were going to patent only one process.

Mr. Chairman: That amendment has not yet been passed?

Mr. Curt Engelhorn: Has not been passed.

Mr. Chairman: The current law is only for process patent?

Mr. Curt Engelhorn: Another difficulty in respect of process patent is its interpretation by the courts. It is very difficult to administer in the court. For that reason it is considered that the product patent should be introduced. But it has to be mentioned here that this draft of the European Patent Convention which has been agreed to by the German Government and it has been also agreed to by many other Governments and has been reviewed also by a number of nations does provide product patents even for chemical and pharmaceutical inventions so that if Germany wants to enter this European Patents Convention, it will have to change its law in that direction.

Dr. L. M. Singhvi: You have mentioned that process protection is without meaning unless there is a shifting of the burden of proof. In that connection you say that in practice, this would mean that it would be impossible to effectively prevent infringements since the infringement cannot be proved. Could you say why it is impossible to prove an infringement? And why the burden of proof should be shifted?

Mr. Curt Engelhorn: You cannot tell from the final product by what process it is made. In rare cases it may be possible if you have an impure substance to analyse it down to a certain point where you can trace more or less what intermediates or solvents have been used. But in a highly purified final product it is practically impossible. Therefore the inventor cannot prove that his particular process has been used. Therefore, it is necessary for the man who is charged with infringement to prove that he has not used this process.

Dr. L. M. Singhvi: Under Sec. 66 you have made an observation that it should be modified to limit the generality of these statements and to clearly define the Government's powers to revoke any patent if it considers that it is mischievous or generally prejudicial to the public. Could you indicate in what way it could be made more specific or whether it could not be left to the court or the constituted authorities to determine as to what is mischievous or prejudicial to the public interest?

Mr. Curt Engelhorn: It is one question, I think, on which the observation is very well taken. I think it is a matter of how things are administered in specific countries. As I have pointed out, in the case of public interest, in Germany the public interest has been interpreted by the courts and the courts have very clear definition. Now in this particular case we feel that it would of course increase the security if these terms 'mischievous to be state' or 'prejudicial to the public' were defined a little more closely. We generally know what "mischievous" means; we know what "generally prejudicial" means; but we don't know what the Parliament, which is supposed to pass the law, means specifically when it says that.

Dr. L. M. Singhvi: What was the state of the patent law in Germany before the second world war began as compared to the post-war patent law in Germany, particularly in respect of compulsory licence, licence of right, etc.? Would it be correct to say that the post-war patent law in West Germany seeks to extend a stronger patent protection than that which was available before the war?

Mr. Curt Engelhorn: Dr. Scholl tells me that there is no essential

change in the patent law before and after the war.

Dr. L. M. Singhvi: You have said that a strong patent protection tended to bring in a greater inflow of foreign capital and foreign technical know-how. In what way has it been very beneficial to West Germany as you have sought to make out in your memorandum?

Mr. Curt Engelhorn: I would definitely think that it increased the preparedness of foreigners to put inventions at the disposal of Germany by way of licensing agreements or by exploiting their inventions themselves in Germany. I think there is no question about that.

Dr. C. B. Singh: I will carry forward the process and product part. You said that you were collaborating with a big firm in Bombay in producing chloramphenicol. Is that correct?

Mr. Curt Engelhorn: Yes.

Dr. C. B. Singh: Have you found any trouble regarding the process for production of chloramphenicol and chloromycetin which are produced in the market by Parke Davis also, because chemically, they are both tetracyclene with certain changes. So when it comes to process and product, has this process patenting been of some difficulty to you?

Mr. Curt Engelhorn: Well, as a matter of fact, here is a case—one of the rare cases I must underline—where it was possible to develop a completely different method of production of chloramphenicol which varies very much from that of Parke Davis. Since our process was independent of the Parke Davis process, that was taken care of. We also came to an agreement with Parke Davis, because certain aspects of our process were advantageous and were of interest to Parke Davis themselves.

Dr. C. B. Singh: Has there been any difficulty to your firm in Italy because there was no patent law in Italy? Was it because of the absence of a patent law that you failed in Italy on this product?

Mr. Curt Engelhorn The situation that developed in Italy was like this. First of all, two or three large Italian companies started the manufacture of chloramphenicol. They soon found out that they could not sell in countries where Parke Davis or ourselves had patent protection. They then came to an agreement with Parke Davis and even through Parke Davis have no patent protection in Italy, these companies were willing to pay royalties to Parke Davis. This was not all of that story, though. Other smaller companies entered the field. After a long period of time, I would say about ten years, production was started. The technology for its production was sufficiently well-known in the United States, Germany and Italy and one could hire a chemist from one of these companies that were producing legally and one could put up manufacture of one's own. The result was that prices dropped because too much chloramphenical was offered. This resulted in the necessity for many of these small producers to sell at as low prices as possible in the so-called world market, that is, in all those countries where they could sell without infringing any patent. Many of these companies, and I would say almost all of these small companies, have since closed down completely or have closed down chloramphenicol production.

Dr. C. B. Singh: In view of this experience of yours, will you agree to our modification of the patent as process-*cum*-product patent? Will that solve some of these problems that you face?

Mr. Curt Engelhorn: With a shift of the burden of proof, I think that would be satisfactory, even though I tried to point out that there is a general tendency to use the more simple and clear product protection.

Dr. C. B. Singh: On page 3, para 2 of your memorandum, on Section 48,

you have mentioned "such regulation, which amounts to a nullification of the patent, appears to be in disagreement with the fundamental concept of industrial property and is unknown elsewhere in foreign patent law. The German pharmaceutical industry, therefore, recommends that this section be deleted." The main purpose in having this provision has been public interest and any emergency. Sometimes Government has to face some difficulties about epidemics and other things. Then it becomes incumbent on the Government to do something about it. Now, would you like to stick to your statement that it amounts to a "nullification of the patent" or would you like to qualify this statement, under the circumstances I have mentioned?

Mr. Curt Engelhorn: I would say this: As I have pointed out, in the interest of public welfare, that is for certain well-defined situations even the German Patent Law provides for temporary suspension of the patent. That is Government is free to import such materials in order to cope with an epidemic or a similar emergency. As we understand Section 48, it generally gives the Government the power to import or have other people import on its behalf medicines and drugs. There is no recourse provided to the courts. There is no mention made of compensation. We said that this was not in the best interests of India, because import as we understand it, was not the goal that you were striving for. I understand you are striving for a strong domestic industry and nothing can deal a deadlier blow to your slowly growing and very tender industry than cheap imports.

Dr. C. B. Singh: Will you please qualify this para, so that it may become more acceptable to you?

Mr. Curt Engelhorn: I would recommend that the conditions under which the Government can import be as clearly defined as possible. Secondly, I would provide recourse to some judicial tribunal; and thirdly compensation should not be ruled out in this field.

Dr. C. B. Singh: On page 5, Section 93(3), you have mentioned here that "in our opinion, such regulation goes far beyond any measure reasonably necessary for the safeguard of the public interest".

Mr. Curt Engelhorn: As far as we read this provision and as we interpret it and as we have pointed out in our Memorandum, Section 95(3) enables the Government to direct the Controller to authorise licencees to import the patented article or an article made by the patented process if in its opinion it is necessary to do so in the public interest. Neither the payment of any royalty nor an appeal has been provided for, and that is, as I have already said, what we have in mind. We believe that any such provision should contain the possibility to appeal and also the possibility to be reimbursed by royalty or a similar compensation. In principle, we think, imports are potentially dangerous to your existing industry. When a man has gone through the trouble of building up a manufacturing unit in this country and if the Government has sweeping powers to decree the import of the same material, then you will hurt the manufacturing unit in your country.

Dr. Scholl: In our feeling, there might be cases to give compulsory licences but even if it is necessary to give licences, we do not think that it is necessary to deprive the patentee of the right to work his own patent. That is our idea. That is why we say that this Section should be deleted.

Shri M. L. Jadhav: The price of patented products is higher in India as compared to Germany. If so, what is your suggestion to bring it on par?

Mr. Curt Engelhorn: As far as I am informed—we have some statistics on that subject, Dr. Scholl—this is not the case. We can give you some comparable figures in regard to

prices in Germany and prices in India. I believe, however, generally that patent system is only one factor for high prices. This may be due to a large number of different factors. We believe that there should be other methods of tackling the price problem than putting anything in that respect into the Patent Law, or—if I may say so—pattern the Patent Law in such a way that you have prices in mind hoping that you will in this way solve (get away from) that problem. It is our opinion that prices and patents have nothing basically to do with each other

Shri M. L. Jadhav: Your country is holding certain patents in India. Can you tell us out of the patents that are held by your country how many products are manufactured in India? I want the percentage roughly I do not want the exact figures.

Mr. Curt Engelhorn: I am told that of the patent applications in India, about 10 per cent of the patents issued are being actually worked, according to our statistics. It must be added, however, that of all the patent applications in Germany, only 15 per cent of the patents issued are worked. There is only a small difference between the two. The reason being that the patents have to be applied for—considering the nature of the whole patents law—as early as possible and frequently it turns out that the invention for some reason or the other is not sufficiently advanced and does not give sufficient advantages to justify expensive capital investment.

Shri M. L. Jadhav: Can you give us some examples of difference in prices in Germany and India of one or two products?

Mr. Chairman: There is not much difference.

Shri M. L. Jadhav: There is a difference.

Mr. Chairman: You want the whole list.

Shri M. L. Jadhav: Let him give for 2 or 3 products. I am satisfied.

Mr. Chairman: Can you give us the price of Chloromphenical in Germany?

Mr. Curt Engelhorn: Yes, I have this.

Dr. Scholl: We have some figures of Hoechst. The prices of most of the Hoechst products are almost the same. But the prices of Hoechst products in Italy, of the same products which are sold here, are higher than in India. They are higher in the United States. We have made a comparison of prices of products sold in India and in Germany, United States, Italy and France.

Shri R. P. Sinha: Can you give us a copy of that?

Mr. Curt Engelhorn: Yes, we will give you.

Shri R. P. Sinha: Why the prices in India are cheaper?

Shri Yadav: Can you roughly say what is the time from the date of application to the date of sealing?

Mr. Curt Engelhorn: Average 6 years.

Shri Yadav: You mean that 10 to 12 years from the date of sealing is sufficient. The period for patents in Germany, you say, is 18 years. Will you be satisfied?

Mr. Curt Engelhorn: That may be satisfactory particularly when one has to count the time of five years that is used for processing the application. But if it is the goal of Patent Offices to speed up the examination of patents as quickly as possible and when you get for instance the processing period down to two years, the protection of ten to twelve years would, in our opinion, be rather short.

Mr. Chairman: You said that in Germany you have got 18 years from

the date of application and you say that it takes 6 years from the date of sealing. So it is 12 years.

Mr. Curt Engelhorn: No. The invention is protected from the date of application.

Mr. Chairman: In India also the protection goes back to the date of application. What is your objection for 10 years for pharmaceuticals?

Mr. Curt Engelhorn: We consider 10 years too short.

Mr. Chairman: How?

Mr. Curt Engelhorn: Any regulation that gives protection for any period of time between 14 to 20 years from the date of application would be considered satisfactory.

Mr. Chairman: Here also it is from the date of application. It will be the same period. The time of examination does not count in the life of the patent; 10 years are counted from the date of sealing, and an average period of 4 years, 5 years or 6 years has to be counted for the process. Thus a total protection of 14 to 16 years would be provided and this would be satisfactory.

Mr. Curt Engelhorn: That's good.

Mr. Chairman: That is what the law is now. Whatever time is taken in the examination, specification till the date of grant of patent, that is also taken into account. The protection goes back to the date of application.

Mr. Curt Engelhorn: In our understanding, we had interpreted the law differently.

Mr. Chairman: Our present law according to the Bill before us is from the date of specification. So there is not much difference.

Mr. Curt Engelhorn: Quite generally, as far as the term of a patent is concerned, I think a few things should be said. We mentioned in our memorandum that the absolute minimum of development time for a drug is 3 years from the time when you have information collected for a patent application. But this really is the absolute minimum. It usually takes about 5 years and there are cases on record which took much longer. So, therefore, it can happen very easily that a drug is very often marketed, let us say, 6, 7 or 8 years after filing a patent. This goes for the country where the drug is being developed. Now we have priorities and things like that. The priority period is generally one year. But within this one year a patent in India has to be filed. It may be, however, that introducing the drug or manufacturing the drug in India will take much longer than 1 year after introduction in the home country for various reasons. I am just trying to point out to you that there are very important reasons why the life of patents should not be made too short and we frankly consider 10 years too short. And ultimately, if I may add, we feel that there is a discrimination in these 10 years in the case of drug patents as against 14 years in other cases. This we do not understand.

Mr. Chairman: Do you know that an international Association also recommended that it should be minimum ten years from the date of grant of a licence? Do you agree with that?

Mr. Curt Engelhorn: I think that is something we could agree to from the date of sealing.

Shri P. K. Kumaran: Our primary concern is to make the drugs available very cheap for our people. What, in your opinion, are the factors which keep prices of medicines in India very high, and what do you think we should do to bring down the prices of medicines in India, because even the international price will be very high in the context of the living standard which obtains in India?

Mr. Curt Engelhorn: This is a very difficult question to answer. As far as patents are concerned, I believe they are only one factor. Another very important factor that tends to increase the price of any product is the volume of its production. If you protect an invention or a process by a patent, what you get is a concentration of the product in one hand which would mean an increase in volume in this particular hand. This would tend to bring down prices because volume is a very important consideration.

Another problem in your country, as far as I know, is the fact that the chemical industry is in the beginning of its development. Intermediates and raw materials are being produced necessarily on a comparatively small scale. For instance, in the case of our own production, it was several months ago that a department of the Government investigated our pricing policy without criticising it, seeing that the production cost of Chloramphenicol was may be three times of that in Germany. I think due to devaluation it has now dropped to about twice the price in Germany.

Shri A. T. Sarma: In your statement you recommend 15 to 20 years, but in section 53 there is a distinction in our Bill—14 years for general products and 10 years for drugs. Do you agree that this distinction is required?

Mr. Curt Engelhorn: No, we do not think there is any reason why this discrimination should be made.

Shri A. T. Sarma: Will you kindly cite the names of developing countries that have prescribed 20 years in their legislation?

Mr. Curt Engelhorn: Dr. Scholl tells me that among them France and certain South American countries have provided protection for 20 years. Columbia, for instance, has 10 years with an option to increase by another 10 years.

Shri A. T. Sarma: Apart from your valuable suggestions for which we thank you, do you consider that the Bill will improve research and industrial development in India?

Mr. Curt Engelhorn: The old Indian law, from our point of view, is quite satisfactory.

Shri R. P. Sinha: The witness has said that Indian prices are cheaper than international prices for certain drugs he has mentioned. On the other hand, we have been told that Indian prices are higher than international prices. The witness has also said that the cost of production of a commodity is higher when the scale of production is low. I take it that the scale of production in the United States must be very high. Then, a patent is nothing but the grant of a monopoly, and whenever there is a monopoly, there is a tendency to keep the price high. How do you reconcile all this, that the price in India is cheaper although the cost of production of the basic drug is higher?

Shri V. M. Chordia: I want to supplement his question by quoting what the Kefauver Committee has said:

> "India which does grant patents on drug products, provides an interesting case example. Prices in India for the broad spectrum antibiotics, Aureomycin and Anchromycin, are among the highest in the world. As a matter of fact, in drugs generally, India ranks among the highest priced nations of the world—a case of inverse relationship between *per-capita* income and the level of drug prices."

Mr. Curt Engelhorn: I can add very little to that because I cannot improve upon those figures. I understand you have your organisation of producers in India who should be able to answer this question and give you very detailed figures on the

prices of drugs in India as compared to foreign countries. I shall try to answer about the inconsistency.

Shri R. P. Sinha: Is it because of philanthropy on the part of manufacturers that the prices in India are kept low here?

Mr. Curt Engelhorn: It is a matter how you look at it.

The purchasing power of the public in India is comparatively low. Therefore, in order to increase the volume you may have to drop your prices. In our case, we are collecting no royalty. This again was not philanthropy but for some reason or other we did not get the permission to collect royalty. In spite of that we decided to put our entire process, with its knowhow and everything, at the disposal of the joint venture in India, the reason being that it is a joint venture and we wanted to make it as profitable as possible. I think the answer why prices in India can be lower sometimes than in other countries is to be seen in the fact that the manufacturer has the alternative whether he wants to increase the volume and drop the prices or whether he wants to have a small volume and keep the prices high. We all know that small items in a company's drug line sell at very low volume and produce only losses because they cost more than they can ever bring in the way of profits (earnings).

In Germany, we have invested quite a bit of research and development work into developing this process for the manufacture of chloramphenicol. In Germany the price level of antibiotics in general and of chloramphenicol in particular is competitive because we are not the only producers of chloramphenicol. There is one competitor. Quite frankly speaking, it must be the object of any merchant to try to get the highest possible price. To get the least possible price is very simple. A man in commercial operation is paid for it; that he sells the goods in large quantity, and at as high as possible. Otherwise he is not a good salesman. In this particular case, chloramphenicol, in Germany and in certain other markets, is quite a profitable item, and as far as our German company is concerned, it is one of the products that provides a backflow of money for the money spent on research and development. Research and development in pharmaceuticals is a discouraging story in so far as so many attempts are being made; the promising things when followed up do not lead anywhere; they lead to failure. So, a large effort has to be made. I do not hesitate to tell you that our company spends approximately 10 million DMs on research. It is a substantial figure. If I may add, it must be quite clear that all the failures have to be paid for by the success. The money has to come from some where.

Shri R. P. Sinha: We are anxious to develop our economy and our industries, particularly and pharmaceutical industry. The witness has some experience of our market and our population. He has gone through the provisions of this Bill that is before us. Could he tell us the specific provisions in the Bill that will stand in the way of inflow of foreign capital and foreign technology from West Germany?

Mr. Curt Engelhorn: I will just summarise what we have said in our memorandum. Section 47: product by process protection should be clearly established. Shift of the burden of proof should be provided for. Without the shift of burden of proof the infringement cannot be proved and the patent will be without meaning. This has to be made quite clear.

Section 48: according to our interpretation, it has given broad, sweeping powers to the Government to authorise imports without compensation and appeal. Section 53: we believe that 10 years from application is too short.

Shri Kashi Ram Gupta: It is from the date of completion of the specification; they must understand it; they cannot understand the difference between the date of application and the date of completion.

Mr. Chairman: 10 years from the date of specification.

Mr. Curt Engelhorn: I understand that there is no great difference. It is about 10 months.

Mr. Chairman: Protection dates back to the date of application.

Shri R. P. Sinha: 7 years of protection. Three years are lost from the time of filing the specification and the date of sealing the patent. In actual practice, you get seven years of protection.

Mr. Chairman: The difference is not much.

Mr. Curt Engelhorn: We would like to see at least 10 years of full protection after sealing. We do not see any reason for discrimination between different classes of inventions. Then revocation of the patent is provided for in section 66. It is some thing that I think should be looked at with great care.

Mr. Chairman: Your law has also got that provision.

Mr. Curt Engelhorn: It is a temporary suspension. After two years, when the patent is not worked, in Germany, the patent can be revoked.

Mr. Chairman: Your provision says that revocation of the patent is possble if its working is not in the public interest or where two years after the grant of a compulsory licence the invention is being exclusively exploited outside Germany and the compulsory licence does not sufficiently meet the public interest, and so on.

Mr. Curt Engelhorn: This is an exact translation of the German wording: It is section 15(2). It says that in so far as international conventions do not provide otherwise, the patent shall be revoked if the invention is being worked exclusively or mainly outside Germany; the revocation may be demanded only after the expiration of a period of two years following a valid grant of a compulsory licence and even then only if the public interest is no longer served by the grant of a compulsory licence. Compulsory licences are very very limited.

Mr. Chairman: Here also it will not be so easily granted. It will be done only when the needs of the nation require it.

Mr. Curt Engelhorn: That is very assuring to hear. Compulsory licence has to be granted in public interest. Again when a patent is revoked, it should be proved that the revocation also is in public interest. It should be purely in public interest. Then it is all right. Government could have the power to revoke a patent. I think the solution of temporary suspension in case of emergency is rather an elegant one, however.

Shri R. P. Sinha: You said that the inflow of royalty into Germany is less than the outflow. Can you give the figures?

Mr. Curt Engelhorn: For 1965, the total royalty income for Germany was 299.8 million DM. The total outflow was 660.3 million DM. The negative result was an outflow of 360.5 million DM.

Shri V. M. Chordia: The initial marketing price of chloramphenicol in India was Rs. 1500 per kg. Later on it came down to Rs. 240 per kg. So, Rs. 1360 per kg. were charged more from the consumers in India. Is it justified?

Mr. Curt Engelhorn: I do not think you can get it for Rs. 250 per kg. You can import it from Italy at Rs. 240 per kg. But actually for the Indian

manufacturer it would come close to Rs. 1600 due to the factors I have mentioned before like high price of intermediates. We have been getting nitric acid for our plant in Bombay from an Indian ammunition plant. This cannot be supplied any more. We cannot get concentrated nitric acide which we want. So, we have to build a nitric acid concentration plant because we have to buy 70 per cent nitric acid and concentrate it. This will mean increased cost of production.

If you bear with me, I will give an example. Suppose there is a production of 1000 units of some drug at a cost of Rs. 1000. It comes to Re. 1 per unit. This manufacturer decides to increase the production and he increases it to 1500 units. He calculates and finds that the extra 500 units had cost him only Rs. 200 to produce because he could use the same building, same machinery, etc. It comes to Re. 0.4 per unit. He can drop his price and sell the 1500 units at an average price of Re. 0.8. Or he can sell all the 1500 units at Re. 1 per unit and make excess profit. Or, he can sell the extra 500 units at Re. 0.4 per unit somewhere in the world market. That will depend on the particular situation. Italians have been doing like that; they have been selling it somewhere far away from Italy at the price of Re 0.4 per unit in my example. Then the demand for the product goes up and he has to sell 2000 units. This time he calculates and he finds that the extra 500 units had cost him Rs. 7 per unit It is quite realistic, because he had to build a new building, acquire new machines, etc. Now if he has to sell it at the average price of Re. 0.8 he may have to close his shop. The new average for his production will be more than Re. 1 per unit. I am just trying to explain the risk that anyone has to face.

Shri V. M. Chordia: Anyway, the difference was high. How far your example will apply to this, I cannot say. My second question is, you talked about expenditure on research and gave some figures. May I know what percentage of your total turnover is spent on research?

Mr. Curt Engelhorn: My company spend on research 9.8 per cent.

Shri V. M. Chordia: What are the provisions regarding appeals in ase of disputes?

Mr. Curt Engelhorn: Appeal can be made, in the cases that have been mentioned here, to the lower courts and from there to, what he Americans call, the district courts.

Shri V. M. Chordia: You have no separate judicial tribunal?

Dr. Scholl: For all questions relating to patent applications, patent revocation, compulsory licence and so on there is a High Court consisting of three or four members and from this court appeal can be made to the Supreme Court, which is the Supreme Court for all our country.

Shri K. V. Venkatachalam: This High Court deals only with patent cases?

Dr. Scholl: Yes. Its official name is federal "Patent Court" and it deals with only patent questions for all our country.

Shri V. M. Chordia: If a person gets many processes for a product patented and uses only a few of them, what is the provision in your law to stop this abuse?

Mr. Curt Engelhorn: Firstly, I must say that this is not an abuse. An inventor has to see that he gets his process or invention protected at an early date, because as things stand the only criterion to find out who is the original inventor is that of time. So he must more or less rush to the patent office and apply for a patent. Later on he finds that it has not suffi-

cient economical value to justify a capital investment. So it is never worked. That is the reason why 85 per cent of the patents registered in Germany are not being worked. I do not think any provision is necessary to worry about that, because if any of these 85 per cent of un-worked patents would find interest of someone he will go to the holder of the patent and that man will, in most of the cases, be very happy that finally some use has been found for a patent which he thought was of no value.

Shri B. K. Das: In that case he can get a compulsory licence.

Mr. Curt Engelhorn: It has to be in the public interest. If the man who seeks a licence cannot get a licence from the patent holder, if he can prove that it is the public interest he can apply for a compulsory licence.

Shri Shyamnandan Mishra: It is not quite clear to me what kind of regulatory mechanism operates in respect of prices in Germany. May I know whether the Government exercises certain powers to regulate the prices or the question of prices is left completely to the operation of the market forces?

Mr. Curt Engelhorn: Generally speaking, I would say, it is left completely to the market forces. The reason behind it is that we feel in, by far, most of the cases there is competition. This competition is either due to the fact that there are a number of manufacturers or the supply is more than sufficient. But even in the case of patents, I think one must realise that there are very few patents of such basic importance and such basic nature that the products produced with the help of such patent are practically without competition. But there is no price regulation mechanism in Germany. We do not believe in that. We feel that the free forces regulate the prices sufficiently.

Dr. Scholl: There is only one provision in our criminal law against usury prices. This provision is not only against patent prices but covering all trade.

Shri Shyamnandan Mishra: What is the ratio of foreign patents to German patents? How many foreign patents are based on researches carried out inside Germany? I am asking this question particularly because the problem of finding employment for our scientists on research activities is an extremely acute one in our country. If research activities are carried out elsewhere and we simply take those results, we do not have this employment problem solved.

Mr. Curt Engelhorn: In 1965, 57.4 per cent of the patent applications were made by Germans and 42.6 per cent by foreigners.

Mr. Chairman: Out of the foreign patents granted, how many of them were on the basis of research work done in Germany?

Mr. Curt Engelhorn: You mean research work done by other people in Germany or paid German scientists for doing that work?

Shri Shyamnandan Mishra: If research activities are carried out inside Germany then German scientists will have an opportunity for getting employment in those research activities. If those research activities are carried out in the United States, then your research workers will not have any opportunity for employment. That is a very acute problem in our country and that is why I am asking this question.

Mr. Curt Engelhorn: As far as Germany is concerned, I think the percentage of these patents is extremely low. Most of the foreign companies that do research in Germany do it through German subsidiaries and the patents belong to the German subsidiaries. So, they are in the category of patents belonging to the Germans.

Shri Shyamnandan Mishra: I am not asking about the exploitation of the

patent but the birth of the patent as a result of the research activity. How do these patents come into being? Are these as a result of research activities in Germany or outside Germany?

Mr. Curt Engelhorn: 42.6 per cent of the patents are the result of research work done in foreign countries and the rest in Germany itself.

Shri Shyamnandan Mishra: What are the factors in Germany which are acting as a deterrent to the inventions coming to Germany? Are there any difficulties or obstacles?

Mr. Curt Engelhorn: In fact, too many are coming to Germany. Foreign investment in Germany is rather heavy. You may have heard that France has taken a number of steps in order to discourage substantial American investment in France. That is a problem faced by many expanding economies of Europe. The climate for investment in these countries is good. As far as the exchange of patentable or even unpatented know-how is concerned, very good base has been established. There is rather free flow of information. We are working together with a number of American companies and have free exchange of data and experience.

Shri Shyamnandan Mishra: Similarly there could be problems of a different character altogether for under-developed countries. So, they might take certain precautions with regard to patents. Just as France and your country are confronted with one problem, we might be confronted with another problem to face which we might justifiably take some precautions by providing certain safeguarding provisions in our Patent Bill.

Sardar Daljit Singh: Is there any provision for acquisition of inventions in your country? If so, is any compensation paid?

Mr. Chairman: He has already answered that question.

Sardar Daljit Singh: Is there any provision in your country to control the prices of patented drugs in the interest of the common man?

Mr. Chairman: He has answered it just now.

Shri Kashi Ram Gupta: So far as fundamental and basic research is concerned, is it mostly done by the pharmaceutical industry or Government institutions are also doing it?

Mr. Curt Engelhorn: Undoubtedly, Government institutions, universities and so on are also doing a substantial volume of research.

Shri Kashi Ram Gupta: What about basic and fundamental research?

Mr. Curt Engelhorn: That is a matter of definition. I think one can say that more fundamental and basic research of a nature which would tend to increase man's knowledge about basic things and what occur in nature, that type of research is done mostly in State universities. A certain amount of basic research is done by the industry also. Basic research is a question of definition. After all, industrial research has to be in a very broad way but, nevertheless, it has to be aimed at the goal of developing something that will prove of value to the consumer. Our research people always tell the university professors: you have a very nice and easy life, because who is ever going to determine the pace of your work; who is going to have a yardstick for the success of your work; if you take up a project that does not yield any results, there is nobody who can really criticise you. If you happen to produce results, it is much better; you can publish lengthy papers about the experiments that have led to no results as well as experiments that have yielded results. But we in the industry are in an entirely different position. Our work has to be measured by the yardstick of success constantly.

Shri Kashi Ram Gupta: How is the scientist rewarded, so far as his share of the invention is concerned?

Mr. Curt Engelhorn: In Germany we have a law that makes it mandatory for the employer or company to give the inventor a share of the profits; not exactly profits but a proportion of the turnover as royalty.

Shri Kashi Ram Gupta: On page 2 of your memorandum you have stated:

> "The patent protection granted by India heretofore has been satisfactory in principle...."

What is meant by "in principle"?

Mr. Curt Engelhorn: We wanted to say that from our point of view it seemed alright. There may be problems peculiar to India that may not be adequately solved and adequately taken care of by your present law.

Shri Kashi Ram Gupta: Then you go on to say:

> "We believe, on the other hand, that we, to a large part, have a grasp of the reasons that have led to criticism and to the attempt to cope with this criticism by changing the Indian Patent Law."

Please explain this.

Mr. Curt Engelhorn: The way we understood it was that the price of patented products played an important part and that the patent was considered a monopoly that would give the inventor the opportunity to make excess profits and similar things. That was, as we understood it, the most important driving force.

Shri Kashi Ram Gupta: But, at the same time, you say that the existing law is quite all right and that the changes that are proposed in this Bill are not suitable from the point of view of India. How do you reconcile the two?

Mr. Curt Engelhorn: We believe that the problem that was to be solved, that is, of prices and excess profits and so on, should not be solved by changing the patent law. We do seek protection to the public, but by other means, for instance by antitrust legislation. The patent law should not be used as an instrument to this end.

Shri Kashi Ram Gupta: In your opinion, is there need for any amendment at all?

Mr. Curt Engelhorn: From our point of view, I would say "No."

Shri Kashi Ram Gupta: What generally is the royalty paid in Germany for pharmaceuticals?

Mr. Curt Engelhorn: That varies greatly. As far as exclusive licences are concerned, royalties of about 7½ to 10 per cent on the turnover are paid. In the case of non-exclusive licences the royalty figure would be between 5 and 7½ per cent; but, if there are other factors that decrease the value of the invention. it goes below 5 per cent.

Mr. Chairman: In Germany, I understand, inventions of articles of food and taste, medicines and substances which are produced by chemical process in so far as inventions do not concern a specific process for the preparation thereof are not patentable. Is that correct?

Mr. Curt Engelhorn: That rules out completely the possibility of growing a new grain and making flour from that and patent that. There is no patent of that. If it is not a specific process, it cannot be patented.

Mr. Chairman: You object to Government use of patents without compensation but in Germany you have got a provision for the free use of patented inventions made possible by the order of Government in the interest of public welfare.

Dr. Scholl: That is section 8, sub-section (1); but in section 8, sub-section (3), it says that there must be paid adequate compensation if a patent is done away with. There is no use

of patents by Government without compensation—not at all—in the German patent law.

Mr. Chairman: Some compensation has to be paid.

Dr. Scholl: Yes, in every case; and, if I may add, there is full appeal to courts.

Shri K. V. Venkatachalam: Can you tell us whether your Indian company is doing any research in India?

Mr. Curt Engelhorn: No; we are not doing research, but our plan is this. We trained a very clever Indian chemist who, I think, got some basic training here in India, came to Germany, studied at the University of Bonn and was trained in our company for, I think, 2½ years. He has done an excellent job in building up the production facilities in Bombay. The next thing that we plan to do is to equip a quality control laboratory. Of course, production control is already being done, but as a next step to finishing and packaging, we will erect a quality control laboratory. In addition to this, as an annexe, so to say, we will add a research unit which will be concerned with pharmaceutical research, that is, formulations research and so on, because for the broader pharmaceutical, medicinal research you need a large organisation and a well-balanced combination of pharmacology, toxicology clinical medicine and chemistry. Of course, to build that up, we do not have the resources as yet.

Shri K. V. Venkatachalam: You do not contemplate it in the next five years.

Mr. Curt Engelhorn: No.

Shri K. V. Venkatachalam: As regards process versus product patent, you developed chloromphenicol when Parke Davis must have had their own patent of it. If the German provision for process-*cum*-product patent was not there, you would not have been able to claim a patent for your own process. Is that right?

Mr. Curt Engelhrn: Yes.

Shri K. V. Venkatachalam: So, our line of approach to this problem is basically correct?

Mr. Curt Engelhorn: You are quite right, but I think you have to offset that against the difficulties that lie in process protection. Process protection puts a considerable burden on the inventor.

Shri K. V. Venkatachalam: Quite true. But if the German law had allowed only product patent, your company would not have been able to get the patent for cholorompheniçol at all. Is that not a sufficiently important argument?

Mr. Curt Engelhorn: I do not know. Even though we ourselves benefited, I would quite frankly discuss the situation with you. It came about like this. We had two chemists in our company. Parke Davis had made a disclaimer in one of their publications which said that one could not use cinamic alcohol as a starting product and they said: "We do not understand why this should not work". They started working with it and they saw that actually it did not work, but they found out very quickly—it may be by luck—a way round that. Then they did some very clever additional work and they were able to build up the molecule starting from cinamic alcohol.

Then, the question of economy of the synthesis came in and it was possible to work out this synthesis to the point where it was quite economical. But Parke Davis did also additional work on their synthesis. I think it was in the year 1958 or 1959 that we came to terms. They were sufficiently interested in our process to take a licence on that and we on the other way round. At that time, we were of the opinion that our process was superior. Looking back now, I am

very glad that we made the deal because it was not significantly superior.

Dr. Scholl: Mr. Chairman, with your permission, I would like the following to be added at the appropriate place to my evidence: "The revocation of patents under Section 15, sub-section 2 of the German Patents law is only possible if a compulsory licence had been granted before and if the said compulsory licence had proved insufficient."

Mr. Chairman: Thank you very much.

Mr. Curt Engelhorn: Thank you very much.

(The witnesses then withdrew)

The Committee then adjourned.

MINUTES OF EVIDENCE GIVEN BEFORE THE JOINT COMMITTEE ON THE PATENTS BILL, 1965

Friday, the 8th July, 1966 at 09.40 hours.

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Seth Achal Singh.
3. Shri Peter Alvares.
4. Shri Panna Lal Barupal.
5. Sardar Daljit Singh.
6. Shri Basanta Kumar Das.
7. Shri V. B. Gandhi.
8. Shri H. K. V. Gowdh.
9. Shri Kashi Ram Gupta.
10. Shri Madhavrao Laxmanrao Jadhav.
11. Shri Braj Behari Mehrotra.
12. Shri Naval Prabhakar.
13. Shri A. T. Sarma.
14. Dr. C. B. Singh.
15. Shri Ram Sewak Yadav.

Rajya Sabha

16. Shri Arjan Arora.
17. Shri Babubhai M. Chinai.
18. Shri Vimalkumar M. Chordia.
19. Shri D. P. Karmarkar.
20. Shri P. K. Kumaran.
21. Shri Shyamnandan Mishra.
22. Shri Dahyabhai V. Patel.

23. Shri Mulka Govinda Reddy.

24. Shri Dalpat Singh.

25. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*

2. Shri B. N. Atrishi, *O.S.D.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMAN

Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Neo-Pharma Industries, Bombay.

Spokesmen:

1. Shri N. L. I. Mathias, *Director.*

2. Shri A. C. Mitra.

II. Haffkine Institute, Bombay.

Spokesmen:

1. Dr. H. I. Jhala, *Director.*

2. Dr. C. V. Deliwala, *Asstt. Director.*

III. Mr. J. F. Monnet,

Chambre Syndicale Nationale des Fabricants de Products Pharmaceutiques, 88, Rue de la Faisanderie, Paris—16.

I Neo-Pharma Industries, Bombay.

Spokesmen:

1. Shri N. L. I. Mathias, *Director.*
2. Shri A. C. Mitra.

(The witnesses were called in and they took their seats).

Mr. Chairman: The evidence that you give is public and it will be printed and published; it will be circulated to all the members and will also be laid on the Table of the House. Even if you want anything to be treated as confidential.....

Shri A. C. Mitra: We have nothing to be treated as confidential.

Mr. Chairman: ....it will be printed and published and will also be distributed to members.

We have received your Memorandum and it has been circulated to all the members. If you want to stress any point, you may do so and thereafter members will ask questions.

Shri A. C. Mitra: I have come here particularly at the request of the company to explain to you the circumstances which have led the Neo-Pharma to this position....

Shri R. P. Sinha: We would like to know what is Neo-Pharma.

Shri A. C. Mitra: Neo-Pharma is a company.

Shri K. V. Venkatachalam: Say something about that Company.

Shri A. C. Mitra: I represent Neo-Pharma Industries Private Limited. It is a pharmaceutical company manufacturing, among other things, for intending to manufacture a very important life-saving drug known as Chloramphenicol, which is the Chemical name for Choloromycetin, which is so essential for the health and well-being of the people of our country.

We were given an industrial licence under the Industries (Development & Regulation) Act on the 6th February, 1960 and we had been asked to start the manufacture of this within six months. Nearly six years have elapsed, but nothing is happening for the very simple reason that Parke Davis have, throughout this period, taking full advantage of the lacuna in the Patents & Designs Act as it stands today, harassed this company by not giving us the licence and when we applied for a compulsory licence, they took us all over the line, from court to court and applications after applications, so that today, although the compulsory licence has been issued, an appeal has been preferred and a stay order has been obtained. The result, therefore, is that, although our company has spent lakhs of rupees in acquiring the technical know-how, in setting up factories and in acquiring lands, nothing can be done because of the dilatory tactics adopted by a foreign patentee taking full advantage of the provisions of the Patents & Designs Act. I must say that I have come here to impress upon you, if I can, the advantages of the provisions of the new Bill. I have come to support it. I am told that many persons have come and expressed their views on the Bill. I have not come here for that purpose, but I am merely here to tell you, as a concrete case, the difficulties under the old Act that we are experiencing and how the difficulties could be obviated by the provisions of the new Bill. I may give you full details just to explain to you, or to give you a full picture, as to how the delay has taken place and what are the reasons for the delay. Parke Davis have this patent; they have actually got four patents..

Mr. Chairman: You have narrated this in detail in your Memorandum.

Shri A. C. Mitra: If you have read it, I have nothing further to add except that you will see from the way in which they have gone on, the whole object has been to delay the working. The result is that, at the moment, there are two companies—one German and the other, American—who are intending to create between themselves a monopoly. I shall tell you how.

Mr. Chairman: Which is the German firm?

Shri A. C. Mitra: Boehringer.

Between them, they are manufacturing a good percentage of this life-saving drug and their object in preventing us from coming to the field is this: when the country is urgently in need of the drug and if we are not manufacturing, they will say, "increase my quota and give us further licence to manufacture more". The result would be that ultimately they would create a monopoly between themselves—Parke Davis and Boehringer. These two people would be the monopolists of this life-saving drug.

We have entered into a collaboration agreement with an Italian concern called Archifar. They have got the technical know-how and it is their technical know-how that we are now exploiting. These people first of all filed an infringement application saying that Archifar are nothing more than our Principals and since Archifar are the infringers, we are also the infringers. And all along the line they have been filling their appeals in the Calcutta High Court with the result that the collaboration agreement between us and Archifar could not be given effect to. Finding the difficulty we filed a petition under Sec. 23c.c. for a compulsory licence and when the compulsory licence was applied for and after going into the matter the Controller said, 'Let us see what terms you are agreeing to to give the licencee' Parke Davis said 'Nothing of the kind. You first of all decide whether you are going to give the licence or not. Then I will give you the terms.' On that they went upto the High Court again and so on. All these details have been given in our memorandum. I can read it if you so desire.

What I am emphasizing is that under the old Act it is open for a person who is bent upon delaying to do so. The present position is that we have got a compulsory licence but they filed an appeal and a stay order obtained so that the compulsory licence is in cold storage and nothing can be done. The position, therefore, under the present Act is that it is possible for a foreign patentee to harass an indigenous manufacturer in such a way as to create a monopoly in the meantime in the market so that if and when after 10 years we do start the manufacture, the market is already full of these monopolists' goods and they are in a far better position to compete than us who are new-comers in the field. The whole object of the Bill is that these vital industries should be in Indian hands. I understand, subject to correction, that in Japan none of this nonsense is tolerated. They buy out the technical know-how in most cases and that is an end of the matter and practically every single industry is a Japanese industry, not like foreigners coming here and monopolising over here and dictating terms. Government is anxious that these drugs should be manufactured by India and the foreign patentees controlled. Here what we see is that the foreign patentees dictate to our country as to what is to be done and how it is to be done and in the meantime take advantage of the lacuna in the law and the law courts to prevent the avowed policy of the Government, namely the Indianisation of the industry manufacturing these life-saving drugs.

My only submission on this Bill is that the provisions relating to the grant of compulsory licence ought to be carried out with immediate effect so that when the compulsory licences are in fact granted, then there may be a provision made in the present Bill for the Controller giving *ad hoc* compulsory licences and even before hearing the opposite party. I do not say that hearing should not be given. That should be given. There is provision in the Bill for hearing even on the patents but, at the same time, the procedure should not be persisted in such a way that dilatory tactics will be adopted by the patentees.

Mr. Chairman: Would you require this Committee to fix some time limit for granting the compulsory licence?

Shri A. C. Mitra: A time limit can of course be fixed. But the difficulty will always be: for instance, there can be no time limit for a judgment to be pronounced by a court. I have known of cases in certain High Courts, where arguments are over long ago....

Mr. Chairman: But this Bill rules out appeal to Courts. Do you prefer that?

Shri A. C. Mitra: I prefer that.

Mr. Chairman: Would you prefer the setting up of a Patents Tribunal?

Shri A. C. Mitra: I would suggest that the Bill should be left as it is subject to this: that the Central Government, when deciding the appeal, can appoint an ex-High Court Judge together with qualified assessors to go into the case.

Mr. Chairman: Suppose this Committee makes a recommendation that there should be a special Tribunal which should hear only patent cases and dispose of the cases within a particular time limit—what are your views on this?

Shri A. C. Mitra: In England there is what is known as Patents Tribunal functioning. At the moment something like that could be done. But I would suggest that if the Patents Tribunal is a sort of miniature High Court, the same thing arises. I will give you an illustration. A compulsory licence is given to us. I go upto the Patents Tribunal. It stops and gives a stay and then the usual paraphernalia of your submitting your part of the statement and their submitting their reply and so on—the whole gamut of the proceedings take place before the Tribunal and it will ultimately be the same. I am aware of the fact that it does not look nice that a person's right should be interfered with except by the judicial process but what is to be done? Having a Patents Tribunal is all right, but if you put in a Tribunal, the same thing would happen as it happens in a High Court.

Mr. Chairman: May not, when it is specially set up for that purpose and a time limit is also fixed.

Shri A. C. Mitra: If you indicate that the case should be disposed of within a certain time, it is only a pious wish. Supposing it is not done, what is the sanction?

Mr. Chairman: But the other man also must have the satisfaction that it is a judicial adjudication, judicial hearing. Don't you think so?

Shri K. V. Venkatachalam: Supposing the position is reversed, would you like a position in which you do not have the chance at all to explain your situation?

Shri A. C. Mitra: I am not saying that at all, but look at the facts of my own case.

Shri K. V. Venkatachalam: Don't judge on a single case. Take the situation in a larger context.

Shri A. C. Mitra: Speaking as a lawyer and brought up and trained in law, it is the most unpleasant thing to say that a judicial approach should not be done. That is true, but I am merely pointing out this to you to say that the judicial approach when it is honestly done, *bona fide*, it is all right, but there are ways and means left to unscrupulous patentees to delay matters as has been done in this case.

Mr. Chairman: That is why we are suggesting a Special Tribunal.

Shri A. C. Mitra: If you do provide a Patents Tribunal and fix a time limit, then a further provision must be made that on the failure of its being disposed of within the time limit, certain consequences will follow; *i.e.* the order of the Controller will remain—something of that kind should

be there. Otherwise mere mention that it should be disposed of within 3 months will not help one party or the other.

Shri V. M. Chordia: Have you got any experience of the working of the Copyright Tribunal. There the cases are disposed of quickly and there is no delay.

Shri A. C. Mitra: May I make one submission: so far as Copyright Act is concerned, very few people resort to that. As a matter of fact, I have to tell you frankly this is a Tribunal which is going to be resorted to by a large number of people.

Mr. Chairman: You may also know that an appeal will be provided to the Supreme Court only on points of law, not on facts.

Shri A. C. Mitra: In other words what you are suggesting is that there may be only one appeal from the order of the Controller to the Tribunal.

Mr. Chairman: And a second appeal to the Supreme Court only on points of law.

Shri A. C. Mitra: You cannot by any legislation destory the provisions of Art. 136. That is a constitutional power granted to the Supreme Court.

Mr. Chairman: Supreme Court does not enter into the question of time limit.

Shri A. C. Mitra: Under Art. 136 the powers of the Supreme Court to entertain and hear appeals are very wide.

Mr. Chairman: That is true. But only on questions of law an appeal shall lie to the Supreme Court.

Shri A. C. Mitra: Even an inference from the facts is a question of law. Supreme Court's powers under Art. 136 cannot be touched.

Shri V. M. Chordia: May I know how many patent appeals are filed in the High Court on an average?

Shri A. C. Mitra: I have not got the statistics before me.

Shri V. M. Chordia: It will be easier if there is a Patents Tribunal.

Shri A. C. Mitra: I am not suggesting that the tribunal should not be appointed. Of the two evils, if I may say so—High Court and the Patents Tribunal—the Patents Tribunal is the better one.

Shri V. M. Chordia: What is the best?

Shri A. C. Mitra: The Central Government.

Mr. Chairman: But there will be objection because the Central Government is also the executive authority. Some judicial pronouncement is necessary.

Shri A. C. Mitra: For example, the Board of Revenue also exercise appellate powers and in important cases, technical people are also taken in and their advice is taken. The rules may provide for the hearing of the appeals by the Central Government. It will come to the same thing.

One other point is that a time-limit should be fixed within which they must dispose of the appeals. Another point is that while many people, who are dealing with nothing but patent law, say that this present Bill is really an excellent Bill, still they say that the new Bill will entail a lot of administrative work in the patent office and so the staff and other things should be increased.

Mr. Chairman: Yes, we will consider that.

Shri A. C. Mitra: These are the points. The provisions of the Bill have become really necessary and the present case is a concrete example

where the licence was issued within six months, but even after six years nothing has been done. It is possible, if this state of affairs continues, for a patentee to create a monopoly, as in fact they are creating. To-day there is a demand of about 90 tons for this life-saving drug. They are manufacturing at the moment about 30 tons. Formerly they were given licence for about 10 tons. Then, after successfully keeping out others from the field, they come to the Government and say "we are in a position to manufacture more; give us additional tons." Gradually between themselves and this Boehringer, they are trying to create a monopoly in this field.

Mr. Chairman: If we provide six months for the grant of compulsory licence by the Controller and another six months for the patents tribunal to dispose of the appeal, will it satisfy you?

Shri A. C. Mitra: It all depends; in the case of granting of compulsory licence, six months is all right. But the point is, supposing the person wants time.

Mr. Chairman: He should be refused; he should come prepared with all his documents and other things.

Shri A. C. Mitra: You should empower the Controller to give directions in such a way that the entire matter should be disposed of within six months. That would be very very helpful. Similarly if we could give a direction that the patents tribunal, if and when constituted under the Act, should also dispose of the appeal within the specified time, it would be very helpful.

One small point: Suppose a licence is granted to a company and there is an appeal. I was suggesting that during the pendency of the appeal, he should be allowed to go ahead. Now, would you stop entirely the operation of the compulsory licence, or would it be the other way round that once the Controller has thought it fit to grant the licence, he can go ahead, subject to any modifications that may be made later on by the Controller?

Dr. C. B. Singh: How can that be made?

Shri A. C. Mitra: That is in the Bill. I take the risk. When the licence is granted, I go ahead with it. If the licence is rejected, I take the risk. Otherwise I would have to start again after six months.

Mr. Chairman: We will consider that.

Shri A. C. Mitra: It should be optional for the person to do so, and there should not be any restraint.

Shri R. P. Sinha: Is there any similar provision in any other Act of the Government of India?

Mr. Chairman: Please see Section 88(4): "The Controller may at any time before the terms of the licence are mutually agreed upon or decided by the Controller, an application made to him in this behalf by any person who has made any such requisition as is referred to in sub-section (1), permit him to work the patented invention on such terms as the Controller may, pending agreement between the parties or decision by the Controller, think fit to impose." It is there.

Shri A. C. Mitra: Yes, it is there. But that is with regard to the Controller; I was suggesting it for the appeal also.

Mr. Chairman: We will consider it.

Shri A. C. Mitra: There is one more point which I would like to bring to your notice. Critics of this Bill, I am told, have said that the result of this Bill would be that anybody can come forward and whether he is capable of manufacturing or not, he gets the licence and goes on with it. There is no point in this criticism for this rea-

son that in these cases of essential drugs, licences are granted under the Industries Development and Regulation Act and the Drug Controller takes into account the quantity he proposes to manufacture, the target for the next plan, the demand for it and so on and also sees whether the applicant has got the necessary technical know-how resources, etc., before granting the licence. So it is not that anybody can come forward and get the licence.

Mr. Chairman: One of the objections is that it will scare away foreign investment.

Shri A. C. Mitra: If the foreign patentee says that unless he gets full monopoly rights in India, he will be scared away, we will say "bye bye" to him; we will do without him. We will copy, we will infringe his patent; we will do it in the national interest. We had enough of these threats.

Mr. Chairman: Another objection is that it will not promote scientific research in this country, but will retard scientific research.

Shri A. C. Mitra: In Italy—I am speaking subject to correction—nobody bothers about patents. They keep on merrily infringing it and yet the research has not stopped. This threat that unless they get a monopoly they will not come, will always be there. I can assure you that they won't be scared away. Take this particular case. It was given in 1948, I remember. Eighteen years have passed and still they won't give us the licence. (There have been some extensions in this case.)

Dr. C. B. Singh: May I know what is the total out-turn of your Pharmacopeal preparations?

Shri A. C. Mitra: For what?

Dr. C. B. Singh: For the drugs you are producing.

Shri A. C. Mitra: 1½ crores—that is the out-turn of the drugs that we have manufactured.

Dr. C. B. Singh: Out of this 1½ crores, what is the proportion of patented and unpatented drugs?

Shri A. C. Mitra: I do not think that can be given off hand.

Dr. C. B. Singh: Out of this, how many are patented drugs. You can give an approximate number.

Shri A. C. Mitra: I am told, 20% are patented.

Dr. C. B. Singh: Are you sure it is 20%. I would like you to onfirm this point. It is very important.

Shri A. C. Mitra: If I had prior intimation, I could have given you the exact figure. I shall send you the information. This is an approximate idea.

Dr. C. B. Singh: When you came into conflict with Parke Davis, did you know that they were holding the patent right for Chloram-phenical in India.

Shri A. C. Mitra: Yes.

Dr. C. B. Singh: Knowing that, how did you come to terms with the Italian firm for the know-how?

Shri A. C. Mitra: Archifors are manufacturing this drug, and according to the agreement between us, they have to supply us the technical know-how. We have throughout been told that it is a different process, that the Italian process is different. Later on it transpired that they have got the same process. It was then that we asked for a licence from Parke Davis. They will not give us except on certain ridiculous terms.

Dr. C. B. Singh: Without proper examination of the case, you came to terms with the Italian firm and that is why the difficulty arose.

Shri A. C. Mitra: No. This is not correct. The Italian firm promised to produce Chloramphenicol with their own process and we had no idea what that process is until they start manufacturing. Then when Parke Davis said that you are infringing my patent, we asked Parke Davis to give us the licence to manufacture it under their patent. To that, they refused. Then we had to go in for a compulsory licence.

Dr. C. B. Singh: After having spent so much money, did you try by your research work to find out an alternative method to produce this drug?

Shri A. C. Mitra: If it had been so easy in India to have found out an alternative method, there was no point in running after Parke Davis.

Dr. C. B. Singh: For your information, a German firm did that.

Shri A. C. Mitra: Germans did not do that. What they did was they had an additon here and an addition there and with their huge recourses and scientific skill, they made minor variations here and there and certain additions. This they have again patented and now between the two—Boehringer and Parke Davis—each one has given licence to the other. Between the two, they have got a monopoly.

Dr. C. B. Singh: Did you try to come to terms with Parke Davis Company so that they may give the licence to you?

Shri A. C. Mitra: My instruction are, we have approached them, but they refused to give us the licence.

Dr. C. B. Singh: Did you try to come to terms with them? It was a matter for negotiations.

Shri A. C. Mitra: My instructions are, we have had long negotiations with them but the terms were so rigid and so impossible that we could not possibly agree to them.

Dr. C. B. Singh: Can we have the terms?

Shri A. C. Mitra: There were discussions both in Bombay as well as outside with regard to the terms of the licence. Ultimately they did not give us any licence.

Dr. C. B. Singh: Will you be able to give this information about the terms? That is very important, because we have got to go into details as to what terms you offered and what they refused.

Shri R. P. Sinha: Negotiations are no longer secret. The matter is before the High Court where everything is open.

Shri N. L. I. Mathias: We did negotiate with them for the terms and for giving us the licence for the production of Chloramphenicol in this country, but in spite of our attempts both in India with the local management of Parke Davis as well as the parent company in Detroit, USA, they did not make any response to our attempts. Negotiations were rebuffed by dilatory tactics. When we approached the local Managing Director, we were informed that he has no permission to negotiate. When we wrote direct to Parke Davis, Detroit USA, the parent company, they said we will have to discuss with the local company. And this went on for more than a year or two and ultimately in despair we had to go ahead with the Italian collaboration. There was no way of coming to any terms, any type of understanding or obtaining any reasonable settlement. Even our approach for any reasonable terms was being rebuffed. They did not offer any tangible terms. They would say: We shall discuss the matter; we are considering the matter; you should have negotiations with our local company and local company directs us to Detroit, and from Detroit back again here. And that was the process which went on for months and months. If I recollect correctly it went on for 2½ years. In the meantime, we were pressed by Government to tell them the concrete steps that we have taken for the implementation of the licence. We had no answer to give. We had to make

headway. We had to go ahead. The only alternative that was left to us was to go in for an application for compulsory licence, because only through this process, could we make any headway.

Shri R. P. Sinha: What happened to compulsory licence?

Shri N. L. I. Mathias: Compulsory licence has been very recently granted to us. Not being satisfied with all the correspondence and personal discussions in Bombay with the local Managing Director, took the trouble of going all the way to the United States. I went to Detroit expressly for this purpose of negotiating with their Directors and home office and I met the Deputy Chairman and discussed this matter. It was all nothing but just hearing you, trifiling with the entire affair, extending to you all hospitality and packing you back home. This is all that was there. They said: we shall write to you. But writing never came for months. There was no response except that we shall discuss the matter during the next visit of our Managing Director to Detroit—the matter will be discussed and things were left at this stage.

Dr. C. B. Singh: If you had a similar patent in America what will you like? Would you like some one else to draw a copy of it without giving you proper compensation?

Shri N. L. I. Mathias: The question of not giving proper compensation does not arise. We are most willing to give adequate compensation but they are adopting dilatory tactics and trifling with the issue.

Dr. C. B. Singh: With an out-turn of Rs. 1½ crores what is your research set-up?

Shri N. L. I. Mathias: We have none. I can also say that most of the companies in India do not have their own basic research set-up. It requires a lot of resources. We are relatively medium-sized companies. We cannot compare ourselves with big companies like Parke Davis and such other European companies.

Dr. C. B. Singh: Even with your out-turn of Rs. 1½ crores, when you were looking forward to a high profit, it was time for you to do something original in this line.

You have got hardly anything—is that your reply?

Shri A. C. Mitra: We do not have any basic original research set-up but we have certainly developed certain products in the country.

Shri Arjun Arora: You mentioned about some Italian collaborators. Have your Italian collaborators manufactured these medicines?

Shri A. C. Mitra: Yes, our Italian collaborators do manufacture and the same is sold in Italy. They are one of the biggest manufacturers of Chloramphenical in Italy.

Shri Arjun Arora: Do you have any idea of price of this drug that is prevalent in Italy and the price which Parke Davis charge here.

Shri A. C. Mitra: I have no information at the moment.

Shri Arjun Arora: Could you collect and send it.

Shri A. C. Mitra: Well we will try and send it.

Shri Arjun Arora: You mention about Japan preventing the foreigners from hindering Japanese entrepreneurs.

Shri A. C. Mitra: I merely pointed out that in Japan, as far as I know, they buy the complete technical know-how and practically not a single foreigner without Japanese collaboration is allowed to set-up industries in Japan with regard to these certain essential types.

Shri R. P. Sinha: Are you sure of the facts when you say so?

Shri A. C. Mitra: By and large, I am told, that is the method that they are resorting to.

Shri Arjun Arora: You suggested that there should be a time-limit to decide a dispute. What time-limit do you think will be reasonable?

Shri A. C. Mitra: It all depends on the nature of the dispute. If the dispute is about a small matter it can be decided quickly; if it is a complicated one it may take long time. But six months would be maximum that should be allowed and I am sure it can be done.

Shri Arjun Arora: Will you also prefer that there should be no power to stay the implementation of the decision of the Patents Tribunal by any court.

Shri A. C. Mitra: You cannot whittle down the power of the Supreme Court under Article 136.

Shri Arjun Arora: Does not the power of stay come handy to the patentee?

Shri A. C. Mitra: Well if they apply Article 136 and the Supreme Court grants stay there is nothing you can do here. But all depends on the good sense of the Supreme Court whether they would grant the stay or not.

Shri Arjun Arora: Could you give us an idea of the amount of profit that Parke Davis may have earned during the period that they have been keeping you busy in litigation and preventing you from manufacturing?

Shri A. C. Mitra: This is a question which Parke Davis alone can answer. But this much I can say that the demand is so tremendous for this very important drug in our country and compared to the low purchasing power of our people, Sir, the price seems to be even now fairly high.

Shri Arjun Arora: Could you give us an idea of the sale price per unit of Parke Davis and your approximate sale price?

Shri N. L. I. Mathias: Sir, initially we did manufacture this Chloramphenicol in our factory until we were stopped. We have now sold out that stock. We were selling it at a much lesser price than Parke Davis.

Mr. Chairman: What are the exact prices—theirs and yours?

Shri A. C. Mitra: One capsule costs 75 paise, whereas the cost of a capsule which we were manufacturing and selling from out of the stock we had got still, came to 5 annas; it has now come down to 4 annas, *viz.* 25 paise.

Mr. Chairman: On the same units?

Shri A. C. Mitra: 12 capsules of 250 mg.

Shri Arjun Arora: Your colleague mentioned about his visit to Detroit. Had he got the impression that they were not interested in granting him a licence to manufacture in India?

Shri A. C. Mitra; Yes, that is his impression. I will ask him to speak.

Shri N. L. I. Mathias: The general impression. I will ask him to speak. discussions with Parke Davis in Detroit was that there were no *bona fides* in their so-called negotiations with us. They talked to us just out of politeness.

Shri Babubhai M. Chinai: Are you in favour of a total abrogation of patent law?

Shri A. C. Mitra: It is a very important law. It not only protects foreign inventors, but it also gives protection to us.

Shri Babubhai M. Chinai: On every such occasion where the Government has come out with a Bill wherein the power of the Executive is final and

there is no judicial tribunal or any Board or High Court which can be approached, people from the profession to which the hon. speaker belongs, have always objected that there should not be the final authority in the Executive. Will the hon. speaker enlighten us about his views?

Shri A. C. Mitra: The question, Sir, is that our knowledge is limited to certain essential foods and drugs vital to the life of the community. I do not want to speak about any other matter which is not so essential. This is number one. Secondly, as a lawyer on the Bar, the Executive being armed with great power is abhorrent to the judicial mind. But I cannot lose sight of the fact that some judicial processes are abused for self-interest by foreign patentees, as in this case. We have been discussing ways and means how that could be stopped. Although the Executive should not be armed with greater powers, some means must be found to expedite matters.

Shri Dalpat Singh: In your memorandum you have cited a case how some parties have taken undue advantage of the Act. Do you think that the present proposed Bill is again like the existing Act or do you suggest some further changes?

Shri A. C. Mitra: No, Sir. Particularly I tell you, Sir, that the present Bill certainly meets; or at least so it would meet, the situation as the one created by Parke Davis. I am not suggesting any new improvements.

Shri A. T. Sarma: Have you certain difficulties in the Bill? Do you agree with the other provisions of the Bill entirely?

Shri A. C. Mitra: Sir, I have not had time to read the other provisions of the Bill in great detail. I have come here to present that aspect of the Bill which relates to compulsory licence and relating to foods and essential drugs. On that aspect I have come to make my respectful submissions to the committee.

Shri A. T. Sarma: You must have gone through all the provisions of the Bill.

Shri A. C. Mitra: I have gone through, but not to that extent as to assist you in greater detail.

One thing I may tell you. My friend on my left asked about research. Sir, probably my friend also knows that the minimum amount of money required to set up a research centre of the type that my learned friend has in mind, would, I think, be—this is subject to correction—several crores of rupees.

Shri C. B. Singh: We will not talk about that now. We have talked about that till now. You are a lawyer, you can speak about law. You know nothing about research; so, do not talk about research.

श्री चौरड़िया : पुराने पेटेंट कानून की कौन सी धारायें ऐसी थीं कि जिनका लाभ लेकर के आपको 6 वर्ष तक क्लोरमफेनिकाल बनाने नहीं दिया ।

श्री ए० सी० मित्रा : आप सेक्शन 23 सी सी सी । देखिए । यहां पर होता क्या है कि कम्पल्सरी लाइसेंस जब आप दरख्वास्त करेंगे कंट्रोलर साहब के पास तो कंट्रोलर साहब एक नोटिस देंगे पेटेंटी को तुम्हें क्या कहना है, कहो । तब उन को जो कहना है, वह कहेंगे । उसके लिये टाइम लेंगे । टाइम लेकर लम्बी दरख्वास्त करेंगे कि यह है वह है । यह डिस्कशन होते होते तब कहेंगे कि हमारे एक्सपर्ट आ रहे हैं । उसके लिये और टाइम चाहिये । इस तरह टाइम मांगते रहेंगे । अगर टाइम न दिया जाय तो मुश्किल यह हो जाती है कि हाई कोर्ट में केस जाता है तो कहते हैं कि नेचुरल जस्टिस नहीं हुई । इसलिये टाइम दिया जाता है । आखिर में क्या होता है, यहां पर इन दिस पर्टीकुलर केस, कंट्रोलर साहब ने कहा कि अच्छा देखें, हम विचार करेंगे कम्पल्सरी

लाइसेंस दिया जाय या न दिया जाय, इन दि मीन टाइम तुम्हारे टर्म्स क्या हैं। अगर हम डिसाइड करें कि दिया जाय तो तुम क्या टर्म्स रखोगे। लेट मी हैव योर टर्म्स। यह इन्होंने नहीं दिया। इन्होंने कहा कि यह आप क्या कह रहे हैं। आगे आप ही डिसाइड करिये कि लाइसेंस दिया जायगा या नहीं, तब हम टर्म्स दें। यही बात टाल मटोल करते करते आज तक टर्म्स सेटिल नहीं हुए। आखिर में क्या हुआ, इन्होंने कहा कि अपने टर्म्स हम को इस तारीख तक दे दो। उस के बाद फिर ये हाईकोर्ट में चले गये, कहा कि यह ज्युडीशियल फंक्शन है, चूंकि हमारे पास पावर्स नहीं है, इस लिये हम को कोर्ट में जाना पड़ा, अब एफिडेविट हो रही है; रिप्लाई हो रही है।

Shri V. M. Chordia: What are your suggestions so that in future this type of delay may not occur?

श्री ए० सी० मित्रा: बिल में यह कहा गया है, जो चेयरमैन साहब ने दिखाया है। कन्ट्रोलर सीधे लाइसेंस दे सकता है, वे लाइसेंस तुरन्त दे सकते हैं, लेकिन ऐसा नहीं हुआ।

In the meantime, pending discussion, if the licence is granted, work can go on.

श्री चौरड़िया : फिर भी वह स्टे तो ला ही सकते हैं।

Shri B. K. Das: It appears from the memorandum that you are in favour of licence of rights. There is a provision for a maximum royalty of 4 per cent. Will that be enough? There is evidence that it should be left free to be decided upon by the parties concerned. What would be the better provision?

Shri A. C. Mitra: According to my instructions, 4 per cent is a fair return on the patent price.

Shri B. K. Das: Parke Davis had six patents for one product. These are all process patents I believe. Three of them expired and were granted to another party. I want to know whether a patent for more than one process should be granted to a single party, and if he does not exploit it within a reasonable period whether it should not lapse.

Shri A. C. Mitra: That would be a correct approach. He should be given the option of either utilising it himself within a reasonable time, or the new process should be allowed to be exploited by others, unless it is a patent which is inextricably connected with the main one.

Shri K. V. Venkatachalam: Can you give us an idea of the other activities of your firm, what other items are you producing?

Shri N. L. I. Mathias: Neo-Pharma has been by and large specialising in anti-tuburcular preparations. My company is a pioneer in the introduction and in the basic manufacture of PAS and its salts in India. We, in collaboration with another company in Hyderabad and a foreign collaborator, were responsible for pioneering this effort of manufacturing in the country PAS and its salts for the first time.

Shri K. V. Venkatachalam: Is there any exploitation of a patent involved in that?

Shri N. L. I. Mathias: There have been some patents on that also. Therefore, without that we would not have been able to manufacture this in the country.

We have obtained the technical process for the production of PAS and its salts, and we are paying a reasonable royalty of 2½ per cent. Our relationship with that company is reasonably satisfactoy.

Shri K. V. Venkatachalam: If you are successful in getting this licence from Parke Davis for chloramphenicol, what percentage of finished material would you start with?

Shri N. L. I. Mathias: Probably from the stage 25 to 33 1|3 per cent from the top and then go down to the very basic stage from which all others in the world are manufacturing.

Shri K. V. Venkatachalam: Barring Parke Davis, are there any other Indian manufacturers manufacturing chloramphenicol?

Shri N. L. I. Mathias: There are one or two other manufacturers. One of them is working in collaboration with Italian manufacturers.

Shri K. V. Venkatachalam: Don't they have the same difficulty?

Shri N. L. I. Mathias: The position is very clear in as much as Parke Davis which has a widespread network is the originator of this process. There are no two opinions about it. But Parke Davis has had a lease of life of probably 18 years now, because it was in 1948-49 that this product was discovered and had begun to be commercially made available in a good part of the world. Since then Parke Davis has been licensing their own agents and their own nominees in different parts of the world including Italy. After Italy lifted the patents, many Italian companies have been still respecting some of these for the benefit of their overseas consumers. There is one Italian company which has come to an arrangement with Parke Davis and a sub-licence has been given by them to another Indian company called Mac-laboratories. It is a very small, insignificant quantity of about 800 kg. per annum.

Shri K. V. Venkatachalam: Are this long delay and dilatory tactics a solitary case or have there been some other cases?

Shri N. L. I. Mathias: There are also other cases. I would not be able to give you details.

Shri K. V. Venkatachalam: Can Mr. Mitra say, with his experience on the legal side. The only point in my asking this question is because, whether we should make a law based on just one or two cases.

Shri A. C. Mitra: That is not the approach, if I may say so, with respect. The question is, with the law as it stands, is it capable of being exploited by any unscrupulous patentee.

Shri K. V. Venkatachalam: Are there other similar cases?

Shri A. C. Mitra: The fact that it has been exploited is apparent in this case. I do not know. There may be other cases.

Shri K. V. Venkatachalam: One more question. You said your turnover was of the order of Rs. 1½ crores. I should have thought that as a forward looking company, you would put by some part at least for research. You could have started with Rs. 10 to 16 lakhs for research, I think.

Shri N. L. I. Mathias: Unfortunately, with the heavy taxation as well as the expenditure that we have got to incur, net profits are very small. Primarily because we are, in the majority of our products, representing foreign manufacturers and as such we operate on very modest margins. You can produce a turnover but ultimately a modest margin leaves us very little, and if we are to experiment and go into original research, as my friend has suggested, probably we may be going into an empty adventure and ending up in a big loss.

Shri K. V. Venkatachalam: On the one hand you say that you do not want any foreign assistance, and at the same time you say you cannot put up any money.

Shri N. L. I. Mathias: Our country should have basic industries and it is this basic industry that we have been prevented from setting up. It has taken more than six years before we have struggled into getting a compulsory licence. You can control the

industry, despite foreign collaborators having been conceded equity shares in the company. Ultimately, we are supposed to have this industry in Indian hands with Indian labour, capital and run completely with Indian technical know-how.

Shri K. V. Venkatachalam: You have put by money?

Shri N. L. I. Mathias: We have already put in quite some money. We have sent two or three chemists abroad. We have spent quite something to train these people in Italy, and these people also have come into contact with our German, Swiss and French collaborators. These chemists are highly qualified and would have sufficient know-how. They have acquired the technical know-how of chloramphernicol manufacture also.

Mr. Chairman: Thank you very much.

Shri N. L. I. Mathias: There is one small submission which I would like to make before we finish. Reference was made to the question of prices with respect to Parke Davis and other companies. As far as the bulk supplies of chloramphenicol are concerned, the price is Rs. 600 per kilogram, as against the open world market price of approximately Rs. 90 per kilogram. It is the same chemical substance which is produced all over the world, and the process is as old as 18 years. It is their own indigenous production by the same process, but the production is not made available to any actual user. No actual user in the country can purchase this active substance from Parke Davis. We sought to purchase some quantity from them, but they said they did not have anything to spare as their entire production is utilised in the formulation of their own speciality lines. They have, therefore, nothing that they can sell to anybody.

Mr. Chairman: You can buy from other manufacturers.

Shri N. L. I. Mathias: But the price is not very much different. As I said Rs. 90 per kg is the world market price which does not exist in our country, but exists all over the world for the very Parke Davis product. It is the very same substance and not different whatsoever, except that Parke Davis says chloromysktin in manufactured by Parke Davis. It is only a trade name. It is nothing else than a commercial trade name for a chemical substance which people in other parts of the world also manufacture. It is as simple as a text-book reaction and is very simple. But the same process could not be made available to another independent pharmaceutical concern which has the same skill, competence and ability. Why? The very substance which is made available at Rs. 90 per kg in the world market has to be bought by us at Rs. 600 per kg. That is how monopoly conditions are being operated in this country.

Shri Braj Behari Mehrotra: How long are they exploiting this?

Shri N. L. I. Mathias: They have introduced this in different parts of the world since 1948. India also got this at about the same time.

Shri V. B. Gandhi: As compared to Rs. 90, what would be your cost if you can produce it?

Shri N. L. I. Mathias: As far as retail price is concerned, our price could be still cheaper than Parke Davis's. As far as the basic chemical is concerned, we have been prevented from manufacturing it. Our price—if we go into manufacture—it would be rather difficult to mention it.

Shri Ram Sewak Yadav: Approximately?

Shri N. L. I. Mathias: I can assure the Committee that our price will be substantially cheaper than the price of Parke Davis.

Shri R. P. Sinha: Is the patent still alive, from 1948?

Shri N. L. I. Mathias: The patents were 16 years old. Subsequently some of these have been extended. There are some patents which are called additive patents, that is, patents which have been brought into existence with minor variations and changes. I understand the 1948-49 patents have expired.

Shri B. N. Atrishi: 5 patents were applied for compulsory licensing. 3 have already lapsed and at present 2 patents are there for which compulsory licence has already been granted. Parke-Davis have brought an appeal in the Calcutta High Court. But the life-time left for these patents is hardly 2 years. Not a single patent of Parke-Davis has been extended.

Shri R. P. Sinha: May I know whether with the help of the 3 expired patents, it will be possible for you to manufacture this product?

Shri N. L. I. Mathiah: The old patents have been so modified or varied in the form of 'additive' patents that in the ultimate stage, before the final product is got, we have to pass through some reactionary stage or other that is still controlled by the 'additive' patents. That is where they squeeze us out.

Shri B. N. Atrishi: They are independent; I do not think they are patents of addition.

Shri P. K. Kumaran: What prevents them from adding some new substance giving it a different trade name and manufacturing it?

Mr. Chairman: The patent office says they are new patents. There is nothing to prevent you from using the lapsed patents.

Shri N. L. I. Mathias: Our information is they are 'additive' patents. We may be mistaken in the nomenclature as to whether they are additive or new patents, but these patents are so formed that they embrace some reactions of the old patent and the ultimate product cannot be arrived at unless you infringe in some stage or other one of those reactions.

Shri R. P. Sinha: In 1948 chlorophenecol was being manufactured with the help of the three patents which have now expired. Why can't you manufacture it with the process contained in those expired patents by which they were manufacturing it in 1948?

Shri N. L. I. Mathiah: That is what I explained now. The new patents embrace at some stage some reaction covered by the old patent. The new patents are not new from A to Z.

Shri K. V. Venkatachalam: The expired patents were being utilised previously for the production of chlorophenecol. Why can't you use those expired patents? Nobody can challenge you for that.

Shri N. L. I. Mathias: That is what I just explained. At some stage the new patents embrace some reaction covered by the old patent.

Shri R. P. Sinha: We are not satisfied with this argument. The matter is not clear to us.

Shri P. K. Kumaran: I will read out something from the *Sunday Times* dated 4th April, 1965:

"It is not even necessary to change the molecular structure of a product to produce and market a new product. An alternative and highly profitable field for research in the industry lies in the additives. Dr. Weinstein told the Kefauver Committee how Pfizer anxious to market in the US a tetracyline different from other companies (and its own) thought of adding gulcosamine. Glucosamine is a naturally occurring substance which occurs in the blood and this has been added to the tetracycline with the hope

that this would increase the absorption of the tetracycline. This is the only thing hoped for. There is nothing in the combination to change the effect of the tetracycline itself."

If Pfizer could do it, why not we?

Mr. Chairman: We have not got the know-how as Pfizers.

Shri R. P. Sinha: I feel this company has not got even a small research unit to modify it slightly as suggested in this article or even to use the old patents. Therein comes the importance of research. Unless the Bill so provides that it gives incentives for research work or inflow of foreign technical know-how, the progress of pharmaceutical industry cannot take place.

Shri N. L. I. Mathias: If one actually knows the implication and the significance of what 'research' in the pharmaceutical field is, one would probably shudder before going into any original research. Hon. Members would appreciate that it is not easy to go into the research of a product unless and until we have at least the elementary experience of producing it first in the country.

Dr. C. B. Singh: For the information of the witness I may mention that in Japan four leading pharmaceutical companies have spent, mainly on research and development, during the year 1963, 20 lakhs, 22 lakhs, 28 lakhs and 10 lakhs dollars. In India hardly anything is being spent on research.

Shri R. P. Sinha: No research work worth the name is being done in India. Without research work, it is common knowledge, there can be no development in the field of pharmaceutical industry. If the Indian people are not in a position, because of lack of experience or lack of funds or something like that, we have to depend, as Japan and West Germany have done, on foreign technical know-how and research. The anxiety of this Committee is to harmonise between these two points of view. How can we be guided by one solitary instance where injustice might have been done. We will try to see, as far as possible, that such injustice is not done. But we cannot ignore this fact that for a number of years to come, when even advanced countries like West Germany and Japan today are depending upon the research work done in foreign countries, we have to depend upon the research work done in foreign countries and we have to see that the benefits of such research work flows into this country.

Shri N. L. I. Mathias: With all respect to hon. Members of this Committee, I would like to submit that West Germany and Japan, since World War II, has not been responsible for any original research work in the pharmaceutical field.

Mr. Chairman: Thank you very much, gentlemen, for coming and assisting the Committee in its work.

(The witnesses then withdrew).

II. Haffkine Institute Parel, Bombay

Spokesmen:

1. Dr. H. I. Jhala, Director.

2. Dr. C. V. Deliwala, Assistant Director:

(The witnesses were called in and they took their seats)

Mr. Chairman: I have to inform you that the evidence that you give is public and is printed and distributed among members and is also laid on the Table of the House. Even if you want any portion of it to be treated as confidential, still it will be distributed to our members.

We have received your memorandum. It has been circulated to all the members of the Committee. We have visited your Institute also. If you want to mention any new point or stress the points which you have al-

ready made, you may please do so now. Afterwards, our members will ask questions.

Dr. H. I. Jhala: Even though both of us are appearing from the Institute, we shall try not to overlap each other. We shall try to make out separate points so that the time of the Committee is not wasted. I have about ten points to make which I would first like to narrate. Later on, if you have any questions to ask, I shall be grateful to elucidate the points further.

The reason why I am appearing before this body is because the Haffkine Institute is one of the oldest medical research organisations in the country and produces, drugs, especially in the field of biologicals like vaccines and serum, and also for the last 20 or 25 years we are interested in preparation of drugs which have chemo-therapeutical remedies for control of diseases.

We have got a section of organic chemistry, which we call the Department of Chemotherapy, where we synthesize the drugs. We also have a department where we work on indigenous drugs. The drugs that we work upon are worked out for formulations as well as for trying to find out the processes for their manufacture including those for known compounds. If a compound is known already in the field, we try to make out a process of our own to produce it at the Institute. We work out on the laboratory scale as well as at the pilot plant scale and try to get a patent where it is possible to get one.

Besides this, under the present licensing procedures all applications for biologicals being licensed are referred to the Haffkine Institute. Therefore I get a number of agreements of collaboration between various foreign and Indian firms referred to me for the sake of comments.

Shri R. P. Sinha: We would like to know whether the Institute is some expert body or a research institute or some profit-making body.

Dr. H. I. Jhala: The Haffkine Institute is an organisation which is departmentally run by the Public Health Department of the Government of Maharashtra and it is not a profit-making institution.

I only wish to confine my remarks to pharmaceuticals and foods. I am not dealing with any questions of patents which are in the other fields. My field of specialisation is only that. There are many countries in the world, at least ten I know of, which do not allow any patent in pharmaceuticals and foods. I am referring to product patents.

Mr. Chairman: Which are those countries?

Dr. H. I. Jhala: They are Argentine, Austria, Brazil, West Germany, Holland, Iran, Italy, Japan, Mexico and Venezuela. There are some countries which have process patents.

Shri R. P. Sinha: Do these countries allow process patents in drugs and foods?

Dr. H. I. Jhala: As far as my information goes, they do not allow product patent. I have no information about process patent. Some countries allow process patent and there are some which allow both.

When a country grants product and process patent, there are some anomalies that appear. One is that the drugs sold become costlier. They cost much higher in those countries where product and process patents are given. Secondly, it leads to the elimination of competition resulting in monopoly or syndicate resulting in bad practices for exploitation of the market. Thirdly, there is abuse of conditions granted to them. There may be saving clauses, like compulsory licence, but even then they so abuse it that you cannot exercise those rights. The privilege is being misused more than

used in favour of the country granting the licence. Lastly, I find that it only leads to increased sales and increased expenditure on sales through advertisements, commission and many other practices. It does not in any way improve the science in the country because, in any case, the inventor in most of the cases is an individual by himself and he himself does not manufacture; it is the company that exploits the fruits thereof and science by itself is not in any way benefited.

Mr. Chairman: This is as regards product patents.

Dr. H. I. Jhala: Both product and process patents.

So, my submission would be that there should be no patent for product *per se*. If anybody can manufacture it by any other means, he should be allowed to do so. Not only that, but he should be allowed to import it also from other countries. When we give the product *per se* patent, we are not even allowing the import of that product for sale in this country. My submission is that product *per se* patent should not exist.

I am not in favour of having any patents at all in relation to pharmaceuticals and, maybe, foods; but if a process patent is to be granted for other reasons, I feel that there should be a clause for compulsory licence at a reasonable fee. In addition to that, one more clause should be introduced, namely, that if a patent is not used for sufficiently good time, people in the country should be free to exploit it. There should be a clause for revoking that patent.

Many times the patents may be filed not as patents for drugs but as patents for other things. This may be purposely done so that it may not be marked as a drug. But if we find that it is usable or used as a drug in this country, we should get all the rights of revoking that patent if it is not used and also of compulsory licensing. We should also try to introduce a patent of right.

Mr. Chairman: What do you think should be the time limit that should be prescribed?

Dr. H. I. Jhala: No drug in any market has remained for more than five years. In five years all drugs disappear from the market. Of course, I am in favour of going up to seven years with no extension, but as far as drugs go in the market no patented drug remains in the market for more than five years.

Mr. Chairman: Suppose, a drug is not manufactued in the country after it is patented. What is the timelimit that should be prescribed for the grant of a compulsory licence?

Dr. H. I. Jhala: I should think in two years you can manufacture anything; at the most you may give three years. Beyond three years I do not think we should wait, because technology in this country is so well developed that there should not be a lag between a discovery and its application for alleviating human suffering of more than three years.

Then, as regards royalty, I find that royalty is being claimed in various ways, not only straight as a royalty but it is given in various ways in the collaborative agreements. However, if a straight royalty is to be paid, I am of opinion that 2 per cent royalty would be fair enough because, as far as the expenditure goes, even in advanced countries the expenditure on research in pharmaceutical concerns does not exceed 6 per cent of their total expenditure. They have got a very high expenditure on sales and even with that inflated expenditure with lot of sales expenditure, the total expenditure which any company has to do never goes to more than 6 per cent. This they can easily recover. In India it is much less; I do not think it exceeds even 2 per cent.

Mr. Chairman: 2 per cent of what?

Dr. H. I. Jhala: If a company is spending a total of Rs. 100, it spends hardly Rs. 2.

Mr. Chairman: Expenditure for the whole company or for the particular product?

Dr. H. I. Jhala: I am talking about the total expenditure of the company producing the product.

Shri R. P. Sinha: What do you mean by "expenditure"?

Dr. H. I. Jhala: A company incurs expenditure. It has raw materials; it has direct overheads and it has indirect overheads. In the balance-sheet, there is the mention of expenditure of the company and out of that expenditure, 6 per cent only is the expenditure on research in most developed countries.

There is one more point that I want to make. There should be no ban on Government's buying and selling a product if it is necessary for the country's needs. I think, there should be no ban at all on that.

Now, I come to certain other points. Today, there are some oral anti-diabetics drugs which are under the patent and one of the products is Tolbutamide and it comes under the name of Rastinon which is sold by M|s Hoeschest Pharmaceuticals. The same product is produced by another process for which the Haffkine Institute has its own patent and the price of that drug, as sold in the market by us, is 5.5 paise. The same drug is sold for 21 paise per tablet by M|s. Hoeschest Pharmaceuticals. We are able to cover our cost, the research cost, etc., and we are able to sell the drug at the price of 5.5 paise per tablet and that Company charges 21 paise for the same tablet, for the same chemical, in the same city of Bombay. I just want to point out how the granting of a patent increases the cost. The sale of this oral anti-diabetics product in this country is in the vicinity of Rs. 2 crores and the price difference is four times in the same area. This is the point I am making about the high cost of the same product in the same area.

The second way in which the cost is made up is because they try to bring in a compound which is a rather rare compound. For instance, there is a compound Paratoline Sulphamide which is made in India. But if you take Paratoline Sulphamide Carbonate that is not made in this country. Now, the firm will buy the latter at any price they like and thereby increase the cost. If you go into the question of cost accounting, you will be able to come to the conclusion that high price is charged. These are the trade practices followed so that the available cheap raw materials are not used but some specific raw materials are used which will increase the cost.

Whenever we have tried to exploit the question of compulsory licence, we have not been able to get it. During the plague epidemic we were not able to get Sulphathiazole compulsory licence from May and Baker. The then State of Bombay tried to negotiate for it but could not get it. The same thing happened in the days of malaria epidemic. We were not able to get a compulsory licence for Proguanil and our application for a compulsory licence went on for 3 to 5 years. I can say that in most of the cases, these drugs went out of market and we lost our interest. We were told to manufacture it and we proved to them that we can manufacture that drug. They said that we would have to take a compulsory licence. Our product was going to be three times cheaper. But we were not granted a compulsory licence. The case went on for 3 to 5 years and by that time those drugs went out of market.

It is argued that in India, there is a tremendous expansion of the pharmaceuticals industry in the last few years. This is true. But this is not the basic manufacture of drugs. What is being done is that there is an imported component and we try to formulate it. This is not the real development of the country. In spite of granting patents for all these years, I do not think the pharmaceuticals industry has progressed at the same level as it has developed in other

countries. Even in a country like Italy which does not give the patent, the industry has developed very well. They sell antibiotics like Chloromycetine and there was the agreement between the Leptit Laboratory and Parke-Davis. The Leptit Laboratory was acknowledged as the source for the patent which was granted to the Parke-Davis in America. In other words, there are countries where the patent is not granted and yet the development is very well and there are countries like India where the patents have been granted for so many years and yet the development is not that much. Superficially, you may be told that there is tremendous expansion but there is no basic expansion. We have still to depend on the import of raw materials.

India is entering into collaboration with foreign countries for the production of certain drugs and under some of the agreements which have been referred to me I find the foreign firms are taking a lot of money from us under different pretexts. The field in which I work is Biology. There are hardly any patents in Biology. The products are known and made by an open method. There is no secret about it. Yet the agreements which are entered into by foreign countries with our Indian collaborators stipulate that they shall give the building designs when, as far as I know, there is no necessity of building designs and that they shall give the designs of equipment when, as far as I know, there is no necessity of equipment designs because there are standard designs of equipment. They want money for all that. They also stipulate that they shall give the know-how. In the field of Biology, there is no question of know-how. They have no secrets with them. They also say that they shall have the cost accounting system which will be given by the foreign firm, that they shall have to act according the cost accounting system which means that the product will cost more and the royalty rate will go higher. For all these things, they want to take lumpsum payments. I do not think the country is so backward as not to be able to do these things themselves with a sufficient experience.

I submit the Patents Act so far has only given benefits to the foreigners and the legislation as it stands today is not in the best interest of citizens of India. It is high time that we take a fresh view on this as we are trying to take. Even the Committee of the U.S. Senate which was appointed by the U.S. Senate to go into the question of the drug industry and the patent business came to the conclusion that the patents in the United States should be abrogated. The Committee's report was not accepted though it was a Senate Committee. What I submit is that, even in countries like the U.S.A., there is fresh thinking that is developing and there is a fresh mind that is being applied to the present patent law.

Finally I would say that, out of all vested interests, the vested interest in ill health would be the worst and it should not deprive the Indian citizens of the drugs to cure diseases or food for babies; it should also not prevent the Government from rescuing people from epidemics or a diabetic patient from leading a normal life.

That is all. I have made my submission.

Dr. C. V. Deliwala: I have put down some of the points here. It will be better if I read them clearly.

In our attempts to develop technology and create know-how for drugs, we have had a good experience about the working of the Patent Act in India over the past 20 years. Our experience about the working of the patent system and our suggestions in the matter of modification of the Patent Act have been put before the Select Committee in the form of a Memorandum earlier.

Since the last 25 years, the Institute has been engaged in the study of synthetic drugs and has taken out a large number of patents. It has the

distinction of being a pioneer in creating know-how, of modern synthetic drugs without foreign collaboration.

Mr. Chairman: You need not read the Memorandum You may highlight only the salient points.

Dr. C. V. Deliwala: It had to face threats, litigations and other difficulties from foreign firms who alleged in some cases that they alone had patent rights in these drugs.

We are sure, therefore, that our experience in the matter of operation of Patent Act in India would be of great interest to the hon. Members who are earnestly engaged in working out a Bill that will encourage the development of research, inventions and technology and guide the nation towards self-sufficiency and self-reliance. Some of the members of the Select Committee very kindly visited our Institute and saw the work we are carrying out and also gave a patient hearing to our plea for urgent modifications in the Patent Act. We hope that they will appreciate the need for aborgation of the Patent Act or modifying it drastically so that it becomes an effective instrument in the rapid technological development and progress of the country and the well-being of its citizens.

We have suggested total abrogation of patent laws in our Memorandum. If this could not be done due to some reasons, then at least no patents should be granted to inventions covering the manufacture of food, drugs, medicines and chemical intermediates thereof. These suggestions of ours are based on our experiences and observations on how the Patent Act has been utilised by foreign patentees, to prevent the development of Indian know-how, starting of new technology and building up of self-sufficiency.

We sincerely believe that, in the matter of saving life by rescuing from the jaws of hunger, disease, pestilence and death, it is the humanitarian task that should rule supreme. There should be no scope for making undue profit in these matters concerning life and death. In developing countries, including ours, where the majority of the population is not even having sufficient means to purchase their bare minimum requirements of food to ward off hunger, to sell to such population the drugs and medicines or food at prices which are exorbitent and what is worse, to sell them at much higher prices compared to the ruling prices for the same drugs in developed and well to do countries, is a social crime that should not allowed or pardoned.

A study of the patent system in India upto now shows that more than 90 per cent of patents taken out in this country are by foreign firms for the inventions carried out abroad. This is very important. These inventions have not been carried out in India and so the technology has not developed in our country. These inventions have been carried out in their own countries and have been patented here. What percentage of total patents taken out in our country are by Indians? Out of these, how many were subsequently patented in other countries by using the convention of reciprocatory clauses of priority among the patent convention countries? If I make a good invention and if I want to get it patented all over the world, to get the specifications translated in all languages and to arrange to ensure that my patent will be not used by others, it would be difficult; it will cost a fabulous amount for the Indian manufacturers; when they cannot afford to start an industry, what to speak of applying for patents in other countries! So it has only an one-sided affair and we have not been able to take advantage of that. The majority of patentees from foreign countries who have taken patents in our country have done so only to prevent any one in this country from manufacturing the patented inventions and to prevent their import from cheaper sources, so that the highest possible prices could be charged by utilizing the monopoly resulting from

the Patent. Whenever they have been persuaded to take up the production in this country, often they have managed to avoid or postpone the production from basic starting materials and as far as possible, only imported the penultimate product, which by a single or few steps could be converted into the final product calling this "Made in India". They have, of course, given me this argument—of course, they were right: "whatever we have patented here, we are producing here; we prepare a drug; only a couple of stages are involved". So they are right when they say that they are manufacturing from the last stage. We have no grudge against it. But, while doing that, it does not develop the technology of our country. That is what I want to emphasize. It is argued that, in the present Act, there is a provision for compulsory licensing of inventions relating to drugs and medicines, and the Indian nationals should take advantage of it. However, our experience in the operation of this provision of compulsory licensing is that this provision is ineffective. The following instances of our experience will show the inadequacy of the Patent Act and why we should abrogate it or modify it drastically. I am going to give you two cases where we require the drug very badly—one for saving the life of the victims of plague and the other.....

Mr. Chairman: This has already been mentioned.

Dr. C. V. Deliwala: I shall read out only a little.

Mr. Chairman: It is not necessary.

Dr. C. V. Deliwala: I wanted to show that one of the compounds was found by us—we found it; this is the more important part of it—to be highly effective against experimental plague infection in laboratory animals. Then we took out actual chemical trials and we could see that 80 per cent of the plague victims could be saved by treatment with this drug. This drug was required to be manufactured in this country or to be imported immediately. All the knowhow for the preparation of this drug was worked out in the Institute without any foreign collaboration. This drug was not available in the country and attempts were made to get a compulsory licence for the use of Government from the foreign patentee, according to the provisions of the Patent Act existing then. The patentees, however, frustrated the attempts at manufacture of this drug in the country and making it available cheaply on the grounds that Haffkine Institute was not capable of manufacturing the drug due to lack of adequate facilities. This shows how the efforts to save lives of plague victims by taking up the manufacture at a critical time were brought to naught. The drug was later made available in the country by imports from UK in limited quantities at a price of Rs. 250 per lb. by the foreign patentee, whereas our cost of manufacture on a very modest scale, if it was manufactured here, would come to only Rs. 20 per lb. The difference is more than 12 times. The same drug could have been imported from the United States at that time at a landed cost of Rs. 39 per lb. because in U.S.A., there were a number of patentees and the drug was being manufactured and sold, but we could not import it because the patentee in India had the right to manufacture and sell and will not allow anybody to import the drug even if it was available at that cost. This shows how the efforts to save lives of plague victims could not be at that time successfully carried out. The drug was later imported from U.K. as I told you already. Unfortunately this drug could not be imported from U.S.A. where it was very much cheaper because the patentees under the Indian Act had the exclusive monopoly. In U.K. later on the Patentee was challenged in the court and the patent was revoked. As a result the price of this drug even in U.K. came down to a small fraction of the original price.

What I wanted to mention here is that under this patent which was actually invalid—it was not a valid

patent in this country—it was not possible for any one of us to fight or obtain licence and as a result we had to pay a fantastic price for the drug for a number of years even on a patent which was not valid. It is a very important fact and I would like the hon'ble Members to note this.

Another very interesting drug which we were interested to produce was proguanil hydrochloride—an antimalarial drug and the Indian Government was in need of large quantities of this drug. A number of processes of this drug were patented in this country by a U.K. firm. Even at the concessional price of Rs. 95 per lb. offered by the U.K. firm, it was beyond the means of the Government to purchase enough quantities. So the Institute practically worked out the know-how, the process, technology etc., to produce it indigenously and our cost was only Rs. 30 per lb. An application for the grant of compulsory licence was made to the Controller of Patents as pe amendment introduced in the Patents Act after Independence.

Mr. Chairman: It is not necessary to repeat what you have already stated in your memorandum.

Dr. C. V. Deliwala: There are certain minor points which I wanted to bring out fully to your notice.

Tolbutamide is another case. Here, in spite of our having a valid patent for 8 years we were not able to operate on that. The argument is that the process patented by us is not new but is already covered by one of their patents. The case has been pending in the court. They say we are infringing upon their patent. If it is so, they have no reason to go to Japan one month after we have filed our patent in India and take an additional patent covering its manufacture by a process similar to ours. Another interesting fact about this is that this patent has been revoked in Canada. On this patent we have been paying Rs. 2 crores, and they are selling it to-day only in the loose form.

Another interesting case is Chlorpropamide. One gram of the drug contains 4 tablets and one kilo makes 4,000 tablets. Even there also the price is exorbitant—Rs. 35 for 100 tablets. In my memorandum I have dealt with this case very thoroughly and I will not stress that point again.

Under the circumstances, the provisions of the present Patent Act and the legal procedures connected therewith give a monopoly to the foreign patentees. These bitter experiences compel us to submit the following suggestion in the interests of the industrial and technical development of the country and the well-being of the citizen.

Our experience and that of all other Indian manufacturers who have been struggling to create know-how for the indigenous manufacture of important and essential life-saving drugs and medicines would convince anyone prepared to take an impartial and unprejudiced view that the continuance of the Patent law is not in the interests of the country. Under the circumstances, we suggest that the Patent law should be abrogated.

I would request the hon'ble Members to go through a research paper published by the Reserve Bank of India in their bulletin of March 1966—the title of the paper is: 'Patent and the International Transmission of Technology to Developing Countries: with special reference to the Pharmaceutical Industry'. This paper gives valuable data and reasons supporting our suggestion for abrogation of patents.

The country has derived no benefit from the Patents Act for the past 18 years since Independence and it would have been possible to do something if we had no patent Act. We would have already got enough technology.

Pharmaeutical firms invariably exploit the patent monopoly and charge exorbitant prices for their patented products. To justify this they have been giving a number of arguments. I have been discussing with these people who have been opposing this Patent Bill. I will try to deal with their arguments point by point.

In justification of this fantastic level of exploitation these monopoly firms often argue that they have to keep these high prices to recover the high expenditure that they have been incurring on the research and development of new drugs. This argument does not hold any water as shown in the Kefauver Committee's report which found that the actual expenditure on research was only 6 per cent of the sales whereas they have been spending as much as 25 per cent on propaganda and high-pressure salesmanship. It should also be realised that on this 6 per cent they also get some rebate by way of taxes. It is shown as expenditure.

They also say that the high prices are not due to their monopoly rights but due to other factors in our country such as limited production, high overheads, heavy taxation, high cost of raw materials, etc. This is also, in my opinion, false. How will these firms explain the fact that when they were, wholly importing the patented products, which were made in their own countries where presumably the factors like limited production, high taxation, high raw material cost, high labour charges etc. do not exist, still they charged several times the price at which the same drugs could be imported from other countries where there was no patent monopoly?

Another interesting fact is that when they claim to manufacture the patented product in this country, actually they import the penultimate product or the last stage intermediate and only by one or two steps get the finished product. So the cost of processing—they say that it is actually due to the high cost of raw materials—is negligible in the whole production cost. How can they then argue that because of high cost of raw material, etc. they are forced to charge such exorbitant prices?

They also state that there has been a tremendous progress in the pharmaceutical production which was only Rs. 11 crores in 1948 and which is now Rs. 175 crores. On paper these figures seem impressive. However, when the local production was Rs. 11 crores what was the cost of finished pharmaceutical goods imported? Rs. 110 crores worth of finished pharmaceuticals we were importing. All that has happened is that instead of importing the pharmaceuticals in the form of finished products, we now import bulk pharmaceuticals or their penultimate stages and process or formulate them into finished clinical products.

If, for any reason whatsoever, it is decided not to abrogate the Patent Law, then we suggest that at least no patents should be granted for products or processes covering the manufacture of food, drugs, medicine and chemical intermediates used in the manufacture of drugs and medicines.

It is also argued by them, particularly by the foreign patentees—they say that they have been trying to impress on the minds of the hon'ble Members—that the product *per se* should be introduced because it is going to be useful for the country. I will just try to deal with this point in a little more detail.

We have to argue for, supposing it is going to be introduced, what will be the effects. They argue that product *per se* must be allowed because the patents for processes only do not give the patentees adequate protection and returns.

The monopoly drug manufacturers suggest that the research and development energy should not be wasted by directing it towards better and chea-

per processes of manufacturing known effective drugs but should only be directed towards finding out newer drugs. Now, what they do is they say "we have got a new sulpha drug, one tablet of which is enough to cure you instead of six tablets of the old drug; instead of taking 60 milligrams, 6 milligrams of this new drug will solve your problem." And there are a number of new tranquilisers now. They say that research should be utilised for finding newer drugs and not for developing cheaper process for manufacturing known drugs. We beg to differ and wish to submit that having found a new drug in itself is of no utility unless the technology of its economic manufacture resulting in its being made available in adequate quantities and at reasonable prices within the reach of the majority of the population.

I have also to stress that in our country, thousands of people die or suffer from maladies not because there is no effective drug for that malady, but they die or remain helpless victims of the disease simply because they cannot afford to purchase the drugs which are known to be effective but which are so costly that they are beyond the purchasing power of these poor victims or even beyond the limited budgetary provisions of the Government hospitals. That is a very important fact.

Any number of examples could be given to show that it is the attempts to find cheaper and better methods of producing known and effective drugs that have contributed to the development of newer technologies and inventions that have not only made the drugs within the purchasing power of the population, but has given tremendous impetus to inventiveness and these activities need all encouragement. The penicillin when it was found was very costly and after development and research its cost has come down. If product *per se* had been given to this, it would not be available so cheap. Take chloromycetin. In Italy, its price was brought down from Rs. 1,100 to Rs. 200 step by step and each step was worked out. So we most emphatically say that no patent protection should be granted for product *per se*. Even the Kefauver Committee has shown that wherever there is product *per se*, the prices there are invariably higher than those in countries where product *per se* is not allowed.

Another point is that the patent granted should give protection in so far as the invention is practised in this country and no rights should accrue to the patentee with regard to importation of patented invention as his exclusive right. This is what I have been trying to emphasise, that whenever a patent is taken out, they make import in such large quantities that it can last even for five years. That is possible. I think in Japan, whenever a patent is granted, they allow it only to be practised in that country; this may be right or wrong; I am not sure about it.

The next point is that some people have suggested that the life of the patent should be much longer because the patent in some cases is not sufficiently remunerative. I would like to deal with this point in some detail, with your permission.

Our suggestion is that "the life of the patent will not exceed seven years from the date of filing specification and no extension should be granted to this period of seven years." It has been represented that the period of protection should be extended to 14 years or in the alternative ten years from the date of sealing of the patent, with the possibility of extension of the term beyond ten years where the patent has not been sufficiently remunerative. It is difficult to find whether it has been "sufficiently remunerative" or not. Our view is that no extension should be given. Even in U.K. extension was given only during war-time when they could not utilise the patents during those years. In the olden days between the labo-

ratory finding and the product development a considerable time had to elapse. Now, however, the modern technology is so advanced that within a very short while, after the laboratory discovery and its clinical evaluation, the product is developed and marketed with "Patent Pending" legend to prevent trespassing by others in that product. Also the protection of patent starts from the date of filing. It is also well-known that in the United States the average life of a new drug is considered to be five years. Now a patent is granted to a person for disclosing his discovery. In return we give him a monopoly to use that patent exclusively for himself. Now in the United States and other countries the life of a new drug is considered to be five years. How is the public going to get benefit out of it? The privilege of having a monopoly for six or eight years is given with the clear indication that the public at large will be benefited as soon as the patent lapses, the drug is out of the market. So, I don't find any reason to support the suggestion for extension. The life of a patent should be seven years at the most, in view of the short life of new drugs.

Another point is that the product is put in the market under their own trade mark associated with it and even after the patent lapses, the trade mark always remains. So the monopoly still continues. I can give you a number of examples. The substance called Hetrozone is being produced by an Indian firm but this is sold by a foreign company under the name of their trade mark Hetrozone, though their patent has lapsed. The majority of the doctors know it only by its trade name and so they immediately prescribe it. So the monopoly continues. We were selling a product similar to Restinon at a much cheaper price. But all over Bombay, even in hospitals and in Government tenders, only Restinon is sought for. So the trade name is still existing and they still continue to get the benefit even though their patent has lapsed. There is no reason why once the patent right has gone, our product cannot be sold. In Japan, the patentees are asked to bring down the price of their products as technology develops. Instead of allowing a man to ask for licence, they always try to bring down the price so that other people are not attracted to take to that manufacture. But in our country this has not happened. They don't bring down the prices. For the last eight years, the same drug is being sold at Rs. 21 for 100 tablets.

Another point is that some people were saying that the life of a patent should be counted from the date of sealing. Now, 'date of sealing' is a very vague term. If the patent is applied for, then even the date of acceptance has got its time variation. Sometimes it is immediately when nobody takes any objection. Sometimes it varies from 1 to 3 years, sometimes 7 years. It is just possible if it is given from the date of sealing, that the persons of the patentee may even try to ask somebody to oppose and delay the matter. Under no circumstances, the period should be counted from the date of sealing. It is always from the date of filing the application. Patent protection right starts right from the date of filing. They take advantage of it right from the beginning. Therefore, it should be given only for 7 years and it should be from the date of application.

Another thing that I want to say is about "Patent of Right." Anybody desirous of operating the same can simply inform the Controller of Patents of his intention to do so alongwith remittance of modest fee and then start manufacturing. There has already been discussion on this. The parties have been trying to oppose this Bill or Act. They have been arguing that there should be a Committee or a Tribunal to decide; the patentee should also have a voice in the matter. This is again going to delay matters. If some trouble arises, it becomes very difficult to come to any conclusion with the patentees. They will be raising number of points.

I would request you to look into this and at least have the provision in such a way that it is possible for any person to utilise the patent, develop the technology and have the licence very quickly. I had told this to some of the Members who visited my place—Haffkine Institute. Suppose I want to manufacture a particular produce because I find the prices have been very high and there is a possibility of technology developing here, I just work for 6 months and develop a product. Then what happens, I go to the Controller of Patents and if this Tribunal or Committee is going to be there and one or two years are going to pass, all my efforts of working on the technology of the product are brought to a naught. It is very difficult to first take the licence and then start the development of technology. If I take one or two years and I am not able to do this, people will say, I have taken out a licence but have not been utilising that licence. It is in everybody's interest that I must have the right to work on that first and then apply for the licence and I must be able to get it very quickly. That is all I have to say.

श्री ब्रज बिहारी मेहरोत्रा : हैफकिन इंस्टीट्यूट रेस्टिनान के बजाये जो टेलबुटामाइड की एन्टी-डायबिटिक की टेबलट बनाई है, क्या वह उतनी ही इफेक्टिव है, जितनी कि रेस्टिनान है !

डा० झाला : रेस्टिनान और टैलबुटामाइड में कोई फर्क नहीं है । वह एक ही कम्पाउंड और एक ही कैमिकल है । रेस्टिनान एक ट्रेड मार्क नाम है, जो कि पेटेन्टिड है । हम ने कोई ट्रेड मार्क नाम नहीं लिया है। हम ने सिर्फ कैमिकल नाम रखा है ।

श्री ब्रज बिहारी मेहरोत्रा : यह नाम आपने रखा है ?

डा० झाला : वह उस का कैमिकल नाम है वह नाम हम ने नहीं रखा है ।

ब्रज बिहारी मेहरोत्रा : आप ने पांच ग्रेन की टेबलट बनाई है या छोटी भी बनाई है ?

डा० झाला : ये दोनों एक ही किस्म और एक ही वजन की टेबलट्स हैं । हम ने दोनो की कीमत कम्पेयर कर के बनाई है ।

श्री रामसेवक यादव : आप पेटेन्ट के खिलाफ हैं । मैं यह जानना चाहता हूं कि जो मौजूदा कानून आप के सामने है, अगर इसमें संशोधन कर दिया जाये तो क्या उस से आप की आवश्यकता पूरी हो जायेगी । किस प्रकार का संशोधन करने से आप को प्रोटेक्शन मिल सकती है ?

Dr. C. V. Deliwala: Sir, the present Bill is alright except that whenever "Patent of Right" has to be marked, it should be possible to obtain the licence quickly.

डा० झाला : ज्वायंट सिलेक्ट कमेटी के सामने जो बिल है, उस में थोडी सी दुरूस्ती करनी चाहिये । इस बिल में पेटेन्ट राइट के लिये दस साल का पीरियड रखा गया है । हम चाहते हैं कि सात साल से ज्यादा पेटेन्ट राइट न दिया जाये । हम यह भी चाहते हैं कि जिस दिन पेटेन्ट फाइल किया जाये, उस दिन से सात साल गिने जायें—जिस दिन पेटेन्ट सील होता है, उस दिन से सात साल न गिने जायें ।

हम यह भी चाहते हैं कि कम्पलसरी लाइसेंस आसानी से मिल जाये । किसी चीज का पेटेन्ट निकाले जाने के बाद अगर यह मालूम हो जाये कि वह चीज़ कोई दवाई बनाने के काम में आती है, तो अटोमेटिकली पेटेन्ट आफ राइट मिल जाये जिस से किसी आदमी को वह दवाई बनाने में तकलीफ न हो । अगर कोई

दवाई किसी दूसरे देश में बनती है, और वही दवाई अगर कोई हमारें देश में बनाना चाहे, तो उस में कोई तकलीफ नहीं होनी चाहिये। अगर वह उस दवाई को जल्दी और सस्ती बना सके, तो उस को पेटेन्ट आप राइट मिलना चाहिये।

श्री रामसेवक यादव : क्या आप दवाओं और दूसरी चीजों में कोई फर्क करते है या आप दोनों के लिये एक ही समय जरूरी समझते हैं।

डा० झाला : हमारा सबमिशन सिर्फ दवाओं के बारे में है चूंकि हम किसी दूसरे फील्ड में स्पेशलाइज नहीं करते हैं, इस लिये हम ने दूसरी चीजों के बारे में कुछ नहीं कहा है।

Shri Kashi Ram Gupta: What is the total annual budget of the Haffkine Institute? And what amount is spent annually on research out of it?

Dr. H. I. Jhala: The total annual budget of the Haffkine Institute is near about Rs. 80 lakh. The staff that is given to me is a combined staff. It also does research; it also does production; it also-renders public health service and also carries out other activities of the Institute. Therefore, it is not possible for me to say this very definitely.

Shri Kashi Ram Gupta: If the Research Department is given under your control and it is totally modernised, what in your opinion should be the outlay on such a modern research institute under present day circumstances?

Dr. H. I. Jhala: There already exists the C.S.I.R. Laboratory—the Central Drug Research Institute, which can be taken as an example and followed.

Shri Kashi Ram Gupta: Are you aware what is the total outlay on the C.S.I.R?

Dr. H. I. Jhala: The total outlay on CSIR is round about 11 crores, but I do not know the total outlay on the Central Drug Research Institute Lucknow.

Shri Kashi Ram Gupta: You are also engaged in commercial aspect of the drugs. You get patents. How many patents have you got at present?

Dr. C. V. Deliwala: Sir, we have taken about 12 patents.

Shri Kashi Ram Gupta: How many patents have you got at present?

Dr. H. I. Jhala: May I supplement the answer to the question. The patents that we take out are not with a view to have large scale production on the premises of the Haffkine Institute. The Institute does not want to produce large scale products for itself. It would lease out the patents and it leases out the patents by a public open auction or through a tender.

Shri Kashi Ram Gupta: How many patents have you evolved and how many evolved patents have been given out to the public?

Dr. H. I. Jhala: 12 patents have been taken out and we worked on the patents regarding sulpha compounds—I will tell you the number—and also we worked on the anti-diabetic drug patents and we are able to produce these drugs on the laboratory scale. Dr. Deliwala will supplement it further.

Dr. C. V. Deliwala: Sir, I would like to make it clear. If the information is put to public use it is better. In case where the foreign firms have been charging an exorbitant profit and when the drug is not available, we only work and carry out research for that particular product only and that is why the number of our patents is very small. The idea is only that.

Shri Kashi Ram Gupta: You have got 14 patents. I want only to know the period.

Dr. C. V. Deliwala: That has been during the last about 15 or 20 years.

Shri Kashi Ram Gupta: So, it means the commercial side of it is taken care of by the firm. Now, do you give at lumpsum money or they pay the royalty.

Dr. C. V. Deliwala: Well recently we have started the royalty system. When we started that then there was trouble and the case has been already going on before the court. Further, we are not motivated for producing drugs unless there is a specific need in the field or where high price is being charged. But having got the patent we try to manufacture for our own requirements on the pilot plants. In regard to the patent we have sold, whenever we have tried to sell a patent, there is always litigation and the court case is pending in the Bombay High Court with the result that the lessee has not been able to exploit it and supply the same to the country.

Shri Kashi Ram Gupta: My point is this. Out of these 14 how many have been given on lumpsum basis and how many on lease money?

Dr. C. V. Deliwala: The tender requires two things, *i.e.*, what will you give as an outright lumpsum to begin with and royalty every year.

Shri Kashi Ram Gupta: Those which are not under litigation are they being worked?

Dr. C. V. Deliwala: The current patent, *i.e.* tollmtamide is under litigation and it has taken 6 years. As far as the second patent about antidiabetic drug is concerned the preparation cannot be released until the first is cleared.

Shri Kashi Ram Gupta: How many patents are there which are not under litigation and they are being worked?

Dr. C. V. Deliwala: The earlier patents have lapsed. There is no possibility of exploiting the patents it has no commercial importance.

Shri Kashi Ram Gupta: What in your opinion, if a private sector firm is there, should be the outlay so far as the basic research is concerned in that firm?

Dr. C. V. Deliwala: I would like to give my opinion. I would not advise at the moment that all the pharmaceutical firms should take up basic research. What we want is that pharmaceutical firms should take up reasearch only in the development of the old drugs, develop the technology and bring down the prices. The work on the research of a new drug requires tremendous amount of money. It is a gamble. If you get, it is all right; if you do not then you are frustrated to carry out further research. So, initially for few years the pharmaceutical firms should do research on the development of technology and prepare the drugs in such a way that the drugs would be made available cheaper in the country.

Shri Kashi Ram Gupta: What will be amount required for such a laboratory?

Dr. C. V. Deliwala: This will not require much money. For whatever money they will spend they get the benefit from it. If they go for research blindly it is possible for these 10 years they may not get anything. Research is a gamble.

Shri Kashi Ram Gupta: Please see to page 3, first para from line 7— are the results of selfless and devoted research workers, clinicians, surgeons, pharmacologists, and other belonging to a host of disciplines of research who have shared, shared freely their findings, results of experiments, new discoveries and made them known by publishing all the details, the know-how, without

waiting for taking out patents, without expecting monetary gains. Even in United Kingdom, by tradition, inventions concerned in the medical and agricultural fields are not patentable. I want to know of which period you are speaking about these things.

Dr. C. V. Deliwala: Even today, Sir, if any surgeon devises a method to operate on heart, it is a research, his technology is not patented. He does not get any benefit. So a lot of clinicians, surgeons, biologists are not in the field. They have been working on the fundamental research and on the work they have done the neer drugs have been found out. Now realise the importance of that work. Behind the scenes a large amount of work is being done in the hospitals, etc. They have been working continuously to do something for the allevation of the human suffering. That is also research. But there is no patent. It is in this particular field that there should not be motive only to make profit.

Shri Kashi Ram Gupta: You have given us to understand that you are against the commercialisation of pharmaceutical industry. For this, taking over of all research by Govt. interests will be necessary. There should only be public sector industries, to produce medicines. The whole nation should be covered by compulsory health schemes. There will be no private selling. The whole population is covered by the health insurance schemes. Then all this profiteering will go away. Are you in favour of it.

Mr. Chairman: You put this question to the CSIR representative.

Dr. C. V. Deliwala: Excuse me I am not capable of answering it.

Shri Kashi Ram Gupta: You are against commercialisation then what else can be done? You say you are in favour of 7 years. Does it mean that those companies should have only light research?

Dr. C. V. Deliwala: I have put it down tentatively. In the earlier years they have been able to take out all the profits because they have been charging very high prices. Why we give patent to a person is because we want him disclose something which he has laboured upon and also that the public should get benefit of it some time.

Dr. C. B. Singh: Now from your statement it is seen that by your spending Rs. 80 lakhs—your annual budget—all the time your activity has been just to try to find out and copy from the drug products produced by the foreign companies which are sold at very high prices. Has that been your activity?

Dr. H. I. Jhala: In one of the departments, yes.

Shri C. V. Deliwala: In one of the Departments.

Dr. C. B. Singh: In one of the Departments?

Shri C. V. Deliwala: We have been doing work of new production also. But while working on this, we are going into the problem a little basically.

Dr. C. B. Singh: But, unfortunately, nothing has been done according to your statement. Hardly anything has been done. That is your own statement. Your main activity has been to bring down the prices of foreign drugs. This has been the reply given by you.

Shri C. V. Deliwala: It is a gamble.

Dr. C. B. Singh: We know that sort of thing very well. I was wondering and I thought that probably you must have devoted some of your time for the solution of some of the

problems. But your main activity has been entirely to bring down the prices of drugs which are being imported at a high cost.

You have been spending Rs. 80 lakhs every year for the last 20 years.

Shri H. I. Jhala: Eighty lakhs? Rs. 80 lakhs is not spent on research. There is a misunderstanding. This is the total. Only one Department is concerned with this activity, and there are other activities also. This is not quite correct.

Dr. C. B. Singh: Your own statement.....

Shri H. I. Jhala: I have made it clear now.

Shri P. K. Kumaran: Some witnesses have stated before this Committee that supposing the patent law is not there, in that case sub-standard drugs may come into the market and development may be hindered. What would you say?

Shri H. I. Jhala: That was in those days. Today, the Drug Controller is there. Any drug has got to be passed by the Drug Controller. It has got to go there.

Shri P. K. Kumaran: Can you suggest something to bring down the prices of manufacture in India, because they are costly. Can you suggest something.

Shri C. V. Deliwala: I have already suggested that it will be possible to reduce the cost of manufacture when there will be good competition. There should be no monopoly. Pharmaceutical firms invariably exploit the patent monopoly and charge exorbitant prices for their patented products. To justify this fantastic level of exploitation these monopoly firms often argue that they have to keep these high prices to recover the huge expenditure that they have always to incur in the research and development of new drugs. However, through investigations it has been found that the maximum expenditure incurred by these firms was only 6 per cent of the total sales on research whereas they spend as much as 25 percent of the total sales on propaganda and high-pressure salesmanship.

Shri Peter Alvares: We are all aweare of the national service of the Haffkine Institute. Dr. Jhala told us that the annual income of the Institute, as a non-commercial organisation, is a crore of rupees. Suppose they had commercially exploited their products, what would have been their annual income?

Mr. Chairman: How can he say that? It is a hypothetical question.

Shri A. T. Sarma: You have pointed that the prices of Indian drugs are cheaper than those of foreign products? Are they of the same efficacy?

Dr. H. I. Jhala: Yes.

Shri A. T. Sarma: Then why does not the Indian product have a proper market in India?

Dr. C. V. Deliwala: That because of the high power salesmanship of foreign concerns.

Dr. H. I. Jhala: Tolbutamide, for instance, was being imported by four or five firms from other countries for some years and they were selling it cheaper than the firm with the patent. The matter was taken to court and the import was stopped, and the patentees go on selling it at a high price. It is you who can remedy it. The litigation procedure should be curtailed.

Dr. C. V. Deliwala: They collect a lot of money by selling these drugs at a very high price. This money they again spent on their sales organisation. It is a vicious circle.

Shri R. P. Sinha: The witnesses said that 14 new patents were taken out by the Haffkine Institute, out of which two are under litigation. I would like to know whether any commercial benefit was drawn out of the other 12 patents they have taken out? Out of these 12, how many have you leased out?

Dr. C. V. Deliwala: None.

Shri R. P. Sinha: You were complaining a lot that patents are taken and not being worked. You have also done the same thing. In your experience, which time does it take for a new drug to get clearance from the clinical research of the Controller of Drugs?

Dr. C. V. Deliwala: That I will know only when I find out a new product. These were old drugs for which we have taken out patents.

Shri R. P. Sinha: When you have got a pilot project in your institute, can you tell me if you have ever tried to find out what time it will take to develop this into a commercial manufacturing stage? I mean the development of a known thing. I want your own Indian experience; not others'.

Dr. C. V. Deliwala: There are drugs and drugs. Some have got eight stages. If you want to develop a substance right from the basic chemical, it will take a long time.

Shri R. P. Sinha: What is the average time taken?

Dr. C. V. Deliwala: It will be six months to one year. It all depends upon the stages involved in the manufacture and the equipment required, etc.

Shri R. P. Sinha: You told us that the period must be five years. But there are several factors to be taken into account for bringing out a patent. If you do not have these under consideration, how can you tell us it takes five to seven years? I cannot understand it. You must give it from your own experience. We can also learn from others.

Mr. Chairman: He has no experience.

Shri R. P. Sinha: The witness has been saying that the life of a new drug is hardly five to six years. Then why does he recommend a patent for seven years. How can the public get the benefit if the life is only five years and when he says that the patent should last for seven years?

Dr. C. V. Deliwala: I am giving two more years leniently, so to say.

श्री चौरड़िया : मैं यह जानना चाहूंगा कि जैसा आपने बताया कि खोज करना एक गैम्बल है और आपकी बात तो दूसरी है, सरकारी काम है आपका, आपका तो बराबर जो भी खर्चा है वह सरकार की तरफ़ से मिलता है, मगर एक व्यापारी अगर इस गैम्बल के झगड़े में पड़े तो उसको उस की आमदनी रिकवर करने के लिए और कुछ खाने पीने का इन्तजाम करने के लिए कितने वर्ष की अवधि दी जानी चाहिए जिससे कि वह अपनी खोज का पैसा भी निकाल सके और अपने बाल बच्चों का पालन पोषण भी कर सके।

डा० झाला : जो हाफकिन्स इंस्टीट्यूट है वह सरकारी डिपार्टमेंट तो है लेकिन वह भी अपना बैलेंस शीट कार्मशियल तरह से बनाता है। ऐसा नहीं है कि वह कार्मशियल तरह से अपना काम नहीं चलाता है। अपना कारोबार चलाने के लिए उसको भी कास्टिंग करनी पड़ती है, कैपिटलाइज़ करना पड़ता है, प्रोफार्मा एकाउंट वगैरह बनाना ही पड़ता है और हमारा यह ख्याल है कि उसके लिए जो आपने कहा, सात साल का समय जो है वह हमने उसका विचार करके ही बताया है।

श्री चौरड़िया : मैं यह जानना चाहूंगा कि गत सालों में आपने कितना रुपया रिसर्च पर खर्च किया और रिसर्च से जो आमदनी हुई उससे कितना प्राफिट किया।

डा० झाला : हमारा सब कम्बाइन्ड फंक्शन है । उसमें सेपरेट फिगर्स हम नही रखते हैं।

श्री चौरड़िया : अभी तो आपने कहा कि कास्टिंग भी आप करते हैं और सब एकाउंट्स उसी तरह रखते हैं तो मैं जानना चाहता हूं कि रिसर्च के सेक्शन पर आपने कितना रुपया खर्च किया और कितना प्राफिट किया।

डा० डेलीवाला : आपका पहला क्वेश्चन था कि एक आदमी सीधा सादा है, उसने कोई डिस्कवरी की तो उसको कितना टाइम लगेगा . . .

श्री चौरड़िया : मेरा पहला सवाल यह था कि जब आप इसको गैम्बल मानते हैं तो एक आदमी जब कुछ रुपया खर्च करता है तो उसको कितनी अवधि दी जानी चाहिए।

डा० डेलीवाला : यह पांच छः वर्ष में उनका एक्सपेंस निकलता नहीं है यह बात नहीं है । उनको वह भी मिलता है और दूसरा भी फायदा मिलता है । सबको देखा जाय तो ऐसा मेरा मानना है और कमेटी की रिपोर्ट भी है, सब लोगों ने जो स्टडी किया . . .

श्री चौरड़िया : आप अपना अनुभव बताइये, औरों की बात छोड़ दीजिए।

डा० डेलीवाला : हमारा अनुभव यह है कि हमारा रिसर्च तो प्राडक्ट डेवलपमेंट के लिए है, इसके बारे में हम को कुछ मालूम नहीं है कि एक परसेन्ट होगा या दो परसेन्ट होगा।

श्री चौरड़िया : आप तो रिस्क ले सकते हैं कि नयी खोज करने के बाद आपको एक पैसा भी प्राफिट न हो लेकिन व्यापारी कैसे यह कर सकता है ।

डा० डेलीवाला : व्यापारी न ले यह हमारा कहां कहना है । व्यवस्थित ले, यह हमारा कहना है । 4 रुपये के माल का 400 रुपया लेता है तो यह कैसे ठीक हो सकता है । 4 रुपये का 8 रुपया ले, 10 रुपया ले, वहां तक हो सकता है । लेकिन हम एक गरीब देश हैं , इतना प्राफिट अगर वह ले तो वह ठीक नहीं है।

श्री चौरड़िया : साइंटिस्ट की हैसियत से आप जानते हैं कि किसी किसी प्राडक्ट में बहुत ज्यादा रुपया खर्च हो सकता है और किसी में कम हो सकता है जो कि एक वर्ष में ही रिकवर हो जाय । किसी में ऐसा खर्च हो सकता है कि दस पन्द्रह वर्ष में भी रिकवर न हो । तो ऐसी स्थिति में आप अपने आधार पर बताइए कि अगर आपका डिपार्टमेंट इन्डिपेंडैन्टली चले तो आप अपने खर्च की रकम कितने सालों में निकाल सकेंगे ।

डा० डेलीवाला : हम यह समझते हैं कि जो बताया है उतने में रिसर्च एक्सपेंसज निकल आयेंगे । कमेटी की रिपोर्ट भी इस बारे में है।

Dr. H. I. Jhala: There is one statement which I made, which I thought I should clarify properly. I said that six per cent was the expenditure in my institute. I will just read out what is the exact position.

> "Even under liberal interpretation of research allowed by the internal revenue survey, research cost of 20 major drug companies represents only 6.4 per cent of the total sales dollar."

That was the point in my mind. There was rather a confusion of the

terms expenditure, output and outturn. So, I just wanted to clarify it.

Mr. Chairman: Thank you.

(The witnesses with withdrew)

(The Committee adjourned to meet again at 15.30 hours)

(The Committee re-assembled at 15.30 Hours)

III. Mr. J. F. Monnet, Chambre Syndicale Nationaledes Fabricants de Products Pharmaceutique, 88 Rue de la Faisanderie, Paris—16.

(The witness was called in and he took his seat)

Mr. Chairman: Mr. Monnet, whatever evidence you give will be printed and distributed to our Members of Parliament. Even if you want any portion of your evidence to be confidential, that will be printed and distributed to the Members of the Committee. We have received your memorandum and it has been circulated to all the members of the Committee. If you want to add anything or stress anything, please do so. Afterwards, our members will put some questions to you.

Mr. J. F. Monnet: Mr. Chairman and Members of the Committee, before entering into my expose, will you permit me to thank you for having accepted my request to come before you, which is a very great honour to my own person and which I consider a homage to my country that has had so good and friendly relations with you in the past and which will certainly be reinforced in the future. I have been particularly sensible to the fact that you in this country have created this hearing, calling for foreigners in a matter which might have been considered by you as really a national problem on which others should not have any say. It is the privilege of great nations and the privilege of great democracies to be able to take such decisions. I have not seen any similar decision being taken in the world except in the USA back in 1945 when I was called at a hearing on their Bill for extension of priority rights for patents that had been lapsing during the war. In that case, foreign countries were directly interested. Your decision in my opinion is the first of its kind and for this I pay my respect to you and to your Parliament.

Since all of you, members of this Assembly, have read my expose, I do not think it is necessary for me to read it again. It may be waste of time. However, I think some additional information, giving more details, might be of interest to you. In my first paragraph, I have mentioned that the patent system has as its first objective the industrialisation of the country where it exists. The advantages and benefits derived from the ownership of patents are subsidiary to this principal objective. In other words, to the inventor it is a lure to bring into the country his skill and knowledge. Many authors on this subject have often confused the picture by claiming that the patent is a monopoly granted to a certain individual or a company. It has to be clarified in the beginning that it is a temporary monopoly, just a facility given to him to help the industrialisation and development and the forward move of the country which grants him the patent. You have had the same idea, the same principles, when the patent law of 1911 was enacted, and it seems that you have experienced the same abuse from the patentees for which you are trying to find remedy. The same experience exists all the world over, and my purpose in coming before you is to put at your disposal the experience of a man who has lived forty years in the field of patents. I started my career in this field and I am still in

it. I lived with it for these forty years witnessing several changes the legislation has been subjected to in my country and also in other countries. I think this experience may be useful at a time when you want to polish up your own rules in view of the welfare of your country and also for aligning your legislation with the great principles and rules which are adopted in other free and liberal countries.

I now come to the French law. You have seen from my paper that the French law dates back to 1844, a time when industry in general was not very broadly developed, with our chemical world in complete infancy and pharmaceuticals practically non-existent. Therefore, you are not surprised that the French legislator did not provide in those days any special measures for chemicals to be put on the same category as any other industrial product. For pharmaceuticals, since at that time there was no question of synthesis of such products but there were only the products extracted from natural sources like opium etc., they decided that on those products there was no question of granting a patent which might act as a monopoly force and, secondly, as a way for some unscrupulous fellows to claim that with their patent they had some kind of a guarantee that their product is good and then make the patients and the public believe like that.

I do not want to add anything to what I have written about chemicals. As you have seen, since in other neighbouring countries like Germany they were reluctant to grant patents covering the products by themselves and had accepted patents only for the processes to manufacture them, many authors in France said that we were in an uncompetitive position with the Germans because when an invention is made in our country of a new chemical a monopoly is created and nobody else can enter into the manufacture of such products while in Germany the reverse is true. I may say that for a while this could find some support, and in respect of certain dyestuffs there was at that time a patent called the "verguin patent" covering dyestuffs unknown before, and since in Germany and Switzerland no patents could cover the same product, imitations were made in those countries which were not allowed to other manufacturers in France. This is the only example that might be quoted, but it has been certainly very broadly discussed in lawyers' circles and industrial circles.

Since then the chemical science has developed very largely and with the years it has been found that processes for the manufacture of a product could be devised besides those described in the patents without difficulty in using the skill of a chemist coming from the university, and in all the countries where patent is limited to the processes they have tried to find ways to apply the coverage of their patent more broadly than the processes which are actually described in it. I am sure that any German you may have had appearing here has told you all this story.

Therefore, in France, seeing this development in the countries of process protection, if I may call it this way, we finally decided that our law was not that bad, and the result has been that chemical industry in France has really tried with very big success in many cases under our system with the environment of this development of chemical science. I may add that in the final draft for the European Community which is going to apply to the six countries of the European Community, there is no longer any exception for the chemical products, and this is actually accepted by all the countries of the European Community except, I must say, the Italians, which have made some reserves regarding chemicals for pharmaceutical uses but these reserves are limited to a period of adaptation which has been

estimated so far by the Italians themselves to ten years maximum.

Now I come to pharmaceuticals. I have given you a broad outline of the development of our legislation in this field. May be, I should add to it some legislation which was not exactly within the subject but which might be of interest to you. There was a legislation which was issued in 1953 relating to compulsory licence of process patents for manufacturing pharmaceuticals. At that time, because of the pressure of the sentimental or emotional side in certain medical circles, instead of the mere application of the patents and compulsory licence after three years under the International Convention in a case where the patentee had not used his patent in the country, the French Government thought it proper to create for the pharmaceuticals a special system whereby compulsory licence would be open to claimants before the expiration of the three year period. So, it was done because of the worries of the medical profession. They say that these three years might be too long and it would be too bad that because of this limit of three years and because the patentee himself does not work his process and does not market the product, the people could not have the treatment they are entitled to. So that, this compulsory licence was instituted. The result has been very revealing on the side of the authorities for one reason. Since 1953 the development of this industry has been very remarkable. After the product has been invented, it takes a long time before you can market it and put it at the disposal of the population. The reason is that new products manufactured by synthesis are more and more potent. It is one of the grounds for their patentability that they should be an improvement on the past. Their potency is very often paid for by some toxicological effects which have to be very carefully studied and avoided. Since 1953 it is very seldom in my country—it has never happened in other countries that a product should be tested, studied, controlled and put on the market before these three years after the patent was issued. Therefore, this delay of three years, even if you cancel it, makes no difference practically for the pharmaceutical industry.

This legislation of 1953 has one particularity. It created conditions for the granting of compulsory licence. The compulsory licence was not open to anybody and for any ground. The conditions that were put by the legislation were that compulsory licence should be granted only if the patentee himself or his associate or licensee has not put on the market the product in sufficient quantities for the need of the population or if the prices were exceedingly high. Because of this legislation, it was in the interests of the industry to make the product in large quantities and put on the market only the best quality.

The question of price was raised only in one instance, namely, the case of Vitamin B-12. May I tell you that story, as there is nothing secret in it? Vitamin B-12 was made in France by my company under a licence from Merck and Company of USA, who were the patentees, and we were putting it on the market when another company in France claimed that our prices were too high. As a matter of fact, our price was the same as the price in USA and other countries of the world. But this party claimed that our prices were too high and they requested for a compulsory licence. Meanwhile, they started production. Unfortunately, because it was the beginning, very big investments were to be made.

Shri R. P. Sinha: What was the price of Vitamin B-12?

Mr. J. F. Monnet: The price at that time was 90,000 old francs a gram. In the United States also it was the same price. This third party put it on the market at the same price as ours. Therefore, the Commission, which was

in charge of granting the compulsory licence, said, "If you cannot prove that the actual user of the process makes an exaggerated profit by selling yourself at much lower prices, your case means nothing" and the licence was not granted.

Since then I may tell you that the prices of vitamin B-12 have come down very seriously. The price now is about 40 US dollars a grain, that is, 200 francs. You, gentlemen, might be surprised by such prices and such differences but the explanation is simple. Every time we have a new product coming from our researches, these researches as you may imagine are very expensive and apply not only to the products which are found successful but also products which we are obliged to discard for one reason or another. We have to amortise those expenses and we have also to invest in the facilities for manufacturing the new product.

When speaking of vitamin B-12 or any product obtained by a fermentation, the investments are very, very big indeed because the yield of the production is very small. To give you an example, in the preparation of vitamin B-12 by fermenting big fermentor the fermentations last for about four or five days and at the end of fermentation the extraction of vitamin B-12, which is a very long and complicated procedure, gives about 500 grammes out of 80,000 litres. That is what makes the price so high. After some years when the process is developed, when we have been able to put together several of these processes, improved the extraction of the product and amortised the expenses, we are able to lower the price and sometimes considerably. We industrialists have, as much as you statesmen, the care of the public health because it comes within our business and it is also a duty we feel very deeply. So, when we can lower our prices, we do it. You have probably seen that in this country, like in other countries, the products which are not under patents have their prices stable or even increasing with time while for all the patented products the prices have always decreased since their first entry into the market. This is a diversion for which I apologise but, I think, this example was of some interest to you.

Shri R. P. Sinha: How many old francs were equivalent to a dollar?

Mr. J. F. Monnet: 500 to the dollar in those days; but, since then, please do not forget that there has been a devaluation in France and the dollar representation is not quite accurate. However, it gives you an order of magnitude.

I have nothing special to add to the general principles of the invention in the field of pharmaceuticals. You have heard probably all the people who have come before you, giving you the general gist of it. The invention of the pharmaceutical product is more in the product itself than in the process being the application of known methods within the scientific field of chemistry.

Now I come to the remedies you thought of and the fear of abuse from the patentees of their dominant position. In France, we had this law of 1953 which has not been worked out. In 1960 a new law was enacted covering the products themselves. You might be surprised that France, starting from a state where no protection was granted in the field of pharmaceuticals, passing through a phase where the processes only for their manufacture were patented, finally in 1960 decided to cover the products themselves. For this, I think, the best information I might give you is the translation of some parts of the *Exposé des Motifs*, what you call in your book relating to the Bill, the Statement of Objects and Reasons. The title of the law is called *The Reformation of the Regime of the*

Manufacture of Pharmaceuticals—I

translate it very bluntly.

This reformation has for essential purpose a solution to two big problems. One is the protection of public health; how to avoid the marketing of pharmaceuticals not sufficiently studied out and, therefore, dangerous for the population. The other is of an economical and financial nature, the number of specialities and the protection of the inventor.

The solution of the first problem is found in the official control of the manufacturing techniques and of the raw materials and the final products before authorisation for sale. For what concerns the second problem, the solution is the creation of a special patent. This solution gives the answer to two pre-occupations. The first one is encouraging scientific research by giving the inventor a guarantee that he shall not be deprived of his invention. The second one is hindering the multiplication of specialities which is justly complained of in France by medical doctors, pharmacists and social security offices." If I may emphasize on this, in 1960, there was a proliferation of specialities under different trade marks and names containing the same active product. Medical doctors, pharmacists and social security offices complained of that situation because it was confusing. No medical doctor knew which of them to prescribe. Pharmacists had to keep very huge stocks unnecessarily since the same products were produced a hundred times. Social security offices were completely confused whether they should select this one or the other one or all of them or part of them. It was a complete mess. The decision of the legislators is well-justified in that sense.

"The patent system is the only means by which the inventor is sufficiently protected for the reward of research and it also prevents the unnecessary multiplication of identical products". I think I have given the gist of the French law and the reasons why it was enacted.

I am not going nor want to enter into several measures that you have provided in the Bill of 1965 for avoiding abuses of monopoly. But I may tell you that our experience has been really a long-range one on a great number of products and this experience has shown that in consequence of the mere threat of compulsory licensing which is refused, as I told you, on these conditions, namely, no delay in marketing, sufficient quantity in the market, good quality of the product and reasonable prices—these conditions being followed by all the inventors there has not been brought any action before the courts. No necessity has been shown of increasing the hurdles for the inventor, for it is also one of the purposes of the law, to put more and more new products at the disposal of the population.

Thank you, Mr. Chairman, that is all I have to say.

Dr. C. B. Singh: Mr. Monnet, you have just mentioned about the European Common Market and you have further mentioned that in Italy, while agreeing to the patent system, they have put in a period of 10 years. May we know why in Italy, where there was no patent in the drugs industry before, they have agreed to put in 10 years period before they completely come under your rules and regulations which you are making for the European Common Market?

Mr. J. F. Monnet: To answer this, I think, an Italian would be in a better position than myself. I am not an Italian and I have no contacts with the Italian legislators but from what I hear either on the side of industrialists or on the side of the people close to the Government in Italy, I imagine this delay was for adjusting progressively to the ideas in their

country to that protection. In a place where complete freedom towards protection has been practised, to take very strict measures which pass from one end to the other, it is very probable that the patent authorities have requested for this delay. I know and probably you may have heard it from the Italian representative who appeared before this hon. Committee that the drugs industry in Italy resent the fact that they cannot have any protection and have been claiming for the establishment of patents in this field. A draft Bill has been brought before the Italian Parliament several times for at least 15 years to establish patents in the field. But this project has unfortunately failed because the Government went out of power; the new Government came and had to take care of more urgent legislation and this is what has delayed measures in Italay so far. For the future they probably feel—not in the industrial circles nor in the scientific circles, but in the general administration circles—that a sort of progressive measure should be taken to be in complete alignment with other countries. They, as I told you already have fixed up to ten years. This request is already two years' old, which means 8 years are left from now.

Dr. C. B. Singh: From your experience in France, you have laid a stress on patenting products rather than processes. But we, in our Bill, have got slightly different ideas; we have, more or less, laid stress on processes rather than on products. With your long experience in this branch and in the modern study of chemistry, would you please tell us this: if, in our Bill we include process-*cum*-product for patent, would that be an improvement?

Mr. J. F. Monnet: You are free to legislate what, you think, is your best interest. My feeling is that by having process patent excluding the product, you will probably have the same embarrassment as we had in France at the time when only processes were patented. These embarrassments and sometimes injustices are as follows:—

In a process patent system, it is practically impossible that every possible process could be drawn and described in the same patent. Methods in chemistry are improving more and more at an accelerated pace and there is nobody who can say, "well, there is no other method for the manufacture of the product of my invention and I feel safe". Therefore, what happens? Suppose an inventor of the product is a scientist in a University of yours or a scientist in another country. He will get the patent to cover the process he has invented. Then the patented product of the man who has had the genius, the idea of the product, who has tested it on animals, who has checked the value of it will come out. Then what will the competitors do? What will the industrialists do? According to their staff in chemistry, they will say, "look there is a Researcher who has invented a process for a wonderful product, but look what protection he is claiming. It is limited to that process. You fellows in the research division should take interest in devising other methods and other processes to make it." And these people will find processes within three months or six months and then the industrialists will apply for patents to cover their own processes. When the scientist, the man who has brains will go to an industritalist—because he himself is not an industrialist or has no means to set up an industry for exploiting that process—to grant a licence or to sell his invention, this industrialist will tell him, "my dear Sir, you have covered the process and I have to start in competition with the other industrialists who have their own processes; I cannot pay much for your patent." And the inventor will really be stolen of his invenuion.

Dr. C. B. Singh: In our Patent Bill we have, more or less left the appeal for any dispute, from the Controller of Patent Rights, to the Government

and we have done this for a special reason. Our experience has been that, on flimsy grounds, court proceedings have been going on and cases have been delayed for 10 or 15 years. What do you think about this?

Mr. J. F. Monnet: My answer, according to my own experience, is this. We, in France, have always a tendency—in the political circles as well as otherwise—to submit any dispute on whatever cause to the normal tribunals and courts because according to the procedure defence is assured the same conditions as the prosecution end a fair treatment is given in the courts.

I understand your objection—I would not say our courts give decisions rapidly unfortunately, we always complain about the slowness of our courts' disposal—the delay in disposal of cases by courts. In France we have a special procedure—I would not speak of any other country because I am not a lawyer—I am an industrialist—I know some problems not in sufficient details but I know how things happen in France. It is possible in France to claim, to ask from the Judge, in case where the interest of the parties or one of the parties is strongly at stake within a short delay, for a direct procedure which we call appeal at a fixed date. Then the court agrees to decide on that fixed date which is made up between the President of the Court and the parties or their representatives. That is how we solve this problem.

You will tell me that this is not a complete solution because there is always in France a recourse to the Supreme Court and therefore, the infringer has still a chance to take before the Supreme Court. I may tell you that an industrialist or a second inventor careful of his company's and of his money, if he has an action against the patentee and even if he has a just case for taking recourse to the Supreme Court against an adverse decision, at this stage puts a severe brake on his activities for if the chances are that his recourse to the Supreme Court will delay the decision he will have to pay increased money for the operations he is still conducting if he loses.

Dr. C. B. Singh: In your memorandum you have mentioned:

> "From the standpoint of economics, it might have been feared that the exclusivity thus granted to the first inventor of a pharmaceutical would lead to abuses, mainly to prices of pharmaceuticals at unreasonable and intolerable heights".

In this country the record is there that our prices differ from international prices; the prices are put up rather high by these patent holders. Under these circumstances when such abuses take place what will you suggest? We have got this compulsory licensing system. What will you suggest in your own way?

Mr. Chairman: He has said that he has no comments to make on this point.

Dr. C. B. Singh: I would like his opinion on that.

Mr. J. F. Monnet: You know our case. I may say just as I remember that my company or the subsidiary of my company who has firms in this country is not touched by your objection which shows that I do not have any experience of that.

Mr. Chairman: By and large do you agree with the provisions that we have made in order to present such abuses?

Mr. J. F. Monnet: Oh, Yes, Some remedy should be made for the abuses and you know as I told you, we do not have any absuses in France because in our law we have provided for this, especially in the case of excessive prices which is exactly what you are referring to right now. In

our law of 1960 it is said that a compulsory licence should be granted immediately if the patentee abuses his monopoly through excessive prices. What is an excessive price is a difficult point to decide and this sometimes may create confusion. I can give you an example.

Dr. C. B. Singh: You have mentioned Vit. B12. The initial price of Vit. B12 was Rs. 2000 per gram and now the price has gone down and it is Rs. 40 per gram.

Mr. J. F. Monnet. Yes, it has dropped substantially. Why? The reason is: When we start with a product we do not have the techniques to produce it in large quantities by simple processes. We have to put up very big installations for a yeild which is practically nothing. I told you that for getting 500 grammes we required 80,000 litres of raw material, and this amount we got after trying many different processes. Naturally, at the beginning the cost price is really high. As we go on improving the processes and as the yields increase due to researches and further trials, the price comes down. I was giving you the experience of Vit. B12 and you confirm it with your figures.

I may recall the penicillin story and I must add that penicillin was not under any patent. It was a free product. I remember, in 1945 when Penicillin came to our country it was not a pure product; and for a small bottle we had to pay two or three dollars. Everybody sold it at this price. There was even competition in this field. So penicillin started at this price. Then improvements were made and now you get a crystalline product which is pure. The prices are completely down.

Dr. C. B. Singh: Having in view experience of that type, what is the remedy for that?

Mr. J. F. Monnet: The remedy comes naturally by the fact that the pharmaceutical industry is obliged by their own sense of public health. They have to take care of that. Also there is the need of increasing their production. It is natural in any industry. When you produce in low quantities, you are never satisfied you should be able to produce in larger quantities and the common people should be able to purchase because there is no purpose in producing big quantities and find that only about 200 people are able to purchase the product. Then there is a natural tendency to lower prices. The prices of patented products have come down in many countries. For the other products the problem is different. And now, about your contention, there are some industrialists who, instead of yeilding to this natural trend of lowering the prices when they improve their processes, maintain their prices high. I agree with you. A remedy should be found.

Dr. C. B. Singh: Our experience has been that the prices of patented drugs have gradually been going down. What is the state of prices of pharmaceutical products which are not patented? I want you to compare the two sets of figures.

Mr. J. F. Monnet: Well, it is difficult to compare because by nature a patented product is new and it is not only new, but it has to be superior to the old ones; otherwise it would not sell. Therefore if you compare a new product to the old one either it is better than the old one or it would not sell, and in that case the patent itself should not have been granted at all.

Shri A. T. Sarma: What is the time prescribed for patent protection in France?

Mr. J. F. Monnet: It is 20 years from the date of application and this delay is exactly the same for the special patents for medical products. I know that you have a feeling that in the field of pharmaceuticals, this delay may seem too long. Maybe if

I had been 20 years younger or rather if we were 20 years before this year, I might have granted some merit in this. But now I am positive that the delay for pharmaceutical products has no reason to be shorter than that for other products for the simple reason that here, more controls are necessary for an invented product to be put on the market. When I speak of controls I speak of experimentation in biology, in physiologoy and clinical experiments. And you know how anxious are the health organisations in all countries—in the United States, in France, etc.—to be sure that pharmaceuticals do not have any tonic effects or side effects which might impair public health.

Shri R. P. Sinha: I would like to seek one clarification from the learned witness. He was talking about Vitamin B-12. You have said that the price of Vitamin B-12 dropper from 90,000 Francs to 40 dollars. You have explained the reasons also. I would like whether the price dropped down to the level they dropped as a result of the endeavour of your company or at that time the prices dropped because there were more than one manufacturers manufacturing the product under compulsory licence system.

Mr. J. F. Monnet: I do not think competition played any substantial role in this. Maybe there has been some but not initially anyhow. The fact is that, as I told you, at the beginning protection comes really when there is difficulty, but since, the processes have been very very substantially improved and with these improvements and with the desire to sell as much as possible of the product, the manufacture has been increased in quantities with better yields and then the prices have come down. You suggest a sort of competition. There is, in fact, some competition. I will tell you what I feel about it. That Patented products are put under some kind of monopoly. These monopolies are local. For instance in Vitamin B-12, the Mereck & Company were the patent owners for its manufacture in the U.S.A. We are the licencee in France. They have got a licencee in England; another in Germany and another in Holland and all of them follow their own policies of lowering the prices when there are improvements. Sometimes it happened that Vitamin B-12 was cheaper in the United States than in France and 6 months later we ourselves were able to make it at a lower price. There was no actual local competition, of course.

Shri R. P. Sinha: I would like to understand at what point of time, the Government of France thought it in the larger interest of the country to grant licence. I would like to know from you at what stage, how many years after the product was introduced.

Mr. Chairman: He has said 1960.

Shri R. P. Sinha: In 1960, Vitamin B-12 was introduced, am I correct?

Mr. J. F. Monnet: Vitamin B-12 went on the market earlier than this. Our patent law on pharmaceuticals dates back to 1960.

Shri R. P. Sinha: When was the compulsory licence for its production granted in France to other manufacturers?

Mr. J. F. Monnet: That was earlier than that. As I explained to you at the beginning of my speech, which covered what was not mentioned in my note, there was no basic change in the law itself. At this time we had the process patent only. Then legislation of 1953 simply created compulsory licences for these patents. Therefore the Action on Vit. B-12 was not based on a product patent but on a patent covering the process for its manufacture.

Shri R. P. Sinha: It is not very clear. I would like to understand this. Your Company, as far as I understand, was the holder of patent for the manufacture of Vitamin B-12. They started this manufacture in France. Am I correct, whatever may be the year? After how many years, compulsory licence for the manufacture of Vitamin B-12, after you started the manufacture, was granted to some other company?

Mr. J. F. Monnet: It was not granted. It was even refused. Anyhow the Action was started about 2/3 years after we went on the market.

Shri V. M. Chordia: German chemical industry is more advanced than the French chemical industry. I think so. Do you agree?

Mr. J. F. Monnet: I cannot agree. Excuse me, Sir, just one word I request, Sir, it may be off the record.

Mr. Chairman: Yes. It will be off the record.

Shri V. M. Chordia: The second question is how much royalty you pay out and how much royalty you get?

Mr. J. F. Monnet: This is another confidential question. I am sorry, Sir, I request that this should also be off the record.

Shri V. M. Chordia: How much royalty you pay out and how much royalty you get?

Mr. J. F. Monnet: Well this is another confidential question. I am sorry to request Mr. Chairman that this should be off the record.

Shri V. M. Chordia: I want to know of France as a whole and not particular of your Company.

Mr. J. F. Monnet: I have not seen any statistics of the breakdown of the licences granted and received in any particular field, especially in the field of pharmaceuticals and, there I am not in a position to give you an answer.

Shri R. P. Sinha: Is it possible for the witness to give a broad figure of the royalties paid out of France and received inside France. I am talking not only of pharmaceuticals but of all the patented products.

Mr. J. F. Monnet: I can give you a broad answer. It pays 600 million frances and it receives between 300 and 400 million francs. I have some remark to make on that because there has been very much publicity recently in several countries relating to this and the general consensus is that except for Switzerland all the important countries pay much more in royalties than they collect. Germany is one of them and France too. Some conclusions have been drawn, especially by lawyers etc., that this was a very dangerous situation. I think it is an exaggerated statement because the majority of licences are granted in countries where we do not work out our own inventions. For instance, when Rhone-Poulenc works out inventions in England May and Baker pays very nominal royalties. The economic balance is made by paying us dividends and profits. These dividends do not figure up in the statistics. The same applies in all the other countries and, therefore, these figures which might lead you to conclude that we are going to a catastrophe, I think, exaggerate the facts.

Shri B. K. Das: When there is any invention for which patent is taken in the pharmaceutical industry in your country does it pay to the scientist something extra over and above his salary.

Mr. J. F. Monnet: This is a very good question to me because there is in the origin of the inventions very many possibilities. In an organised research, that is, in our laboratories where we are organised—I will give you a general sketch this way—there are the chemists; there are the physiologists who are trained to test the chemical products; there are the medical doctors who take care of the

clinical tests. Now these people have meetings and for one reason or other the suggestion may come from one or other.

Mr. Chairman: The question is very simple, *i.e.* do you pay anything additional to the scientist?

Mr. J. F. Monnet: But, Sir, I have to explain how the origin comes and then I will tell you how we pay.

Mr. Chairman: You distribute the favours to all sections, *i.e.*. the man who experiments, the man who makes the tests, etc.

Mr. J. F. Monnet: Yes, Sir, the man in the chemical laboratory, sometimes there are many of them, the man in the testing laboratory, etc.

Mr. Chairman: What is the share of the scientist who has invented?

Mr. J. F. Monnet: The case of the scientist is different because when an invention comes from an outside scientist, which we have too, he is not within a collective organisation, he himself has got the idea of the product to make. Either we purchase his invention or pay the royalty.

Mr. Chairman: Is he paid by agreement?

Mr. J. F. Monnet: Yes.

Shri Kashi Ram Gupta: From your statement I conclude that the fundamental and basic research is also undertaken by the pharmaceutical industry in joint companies, and not separately by the Government Departments. Is it so?

Mr. J. F. Monnet: Yes. However, there is no difference between fundamental research and applied research. We are obliged to conduct both, and in the field of chemistry for instance, in the field of plastics, we have pure scientists in our own organizations. They derive general principles which may or may not apply which is really basic research. I may tell you, we have a laboratory devoted to atomic research which is conducting what you may call basic research.

Mr. Chairman: Are there no patents attached to them?

Mr. J. F. Monnet: No. There is no practical basis. You cannot say that anybody who will apply a particular formula will pay five cents or one dollar. That is impossible. Our theory in France is that scientific work is to be paid for itself, without consideration to the results. This research is on theories. It is subsidised also by Government in some cases. Very often you have probably heard that Germany is subsidising some Scientific laboratories. We do too.

Shri Kashi Ram Gupta: What is the general percentage of sales value that is spent on research in the pharmaceutical industry?

Mr. J. F. Monnet: By us it is 10 per cent of all the turnover.

Shri Kashi Ram Gupta: In the French Act, are there some clauses for having licences?

Mr. J. F. Monnet: We have not anything like that. Compulsory licences achieve the object they are meant for. Royalties are negotiable. There is nothing like fixed royalties. It depends upon the case.

Shri Kashi Ram Gupta: These days generally it is said that an invention goes out of use within ten years. Is it a fact?

Mr. J. F. Monnet: That's right. Ten years is an average a good-figure. However, I must confess that 10 years ago, this figure would have been slightly exaggerated. You have heard of the German product which has created monsters. This is the first time in the history of pharmaceuticals that a pharmaceutical has created

monsters. Since then, every new pharmaceutical that is invented or discovered needs to be tested from this angle, before being put on the market, which was not the case before. I can quote many other instances of that nature.

Shri Kashi Ram Gupta: I think you must have seen the model law by the BIRPI. At page 49, the model law states in the commentary that there can be patents for ten years from the date of the sealing of the patent. Are you in agreement with such classes these days?

Mr. J. F. Monnet: I do not agree now or the reason which I have already given.

Coming to the BIRPI model law or project, as other witnesses who have appeared before you must have told you, it is not a law by itself. It is a compendium of clauses which are offered to the several States interested in establishing a law on patents, with different types of clauses which they may or may not adopt. Some clauses may respond more than others to one's objectives. But the total restrictions which are enacted in the model law are not presented as a sort of a comprehensive system. In other words, the model law gives you some clauses which may meet certain objectives. For instance, take the question of the prevention of the abuse of monopoly by the patentee. They say in the model law that at the time of granting the patent, you may make provision for the grant of compulsory licences either generally or by limiting it to certain specific cases.

Shri Kashi Ram Gupta: This model law is for developing countries.

Mr. J. F. Monnet: I know; that is why I say that I completely agree to that law in this sense that each country, according to its state of development, may feel interested in this provision or that one.

Suppose you tell me 'We Indians are not interested at all in the pharmaceutical industry, we have other things to care for; our agriculture is much more important. We do not care very much whether people die of malaria or this or that disease; what we care for is the production of wheat, rice and—I do not know—what else. In between, we want to import pharmaceuticals also; and we want to import them without having any research of our own, without having any research work done here; we shall pay what we can, but we are not interested in having a pharmaceutical industry', then I would tell you 'Do not make any patent law for pharmaceuticals'. But if you have an idea that some of your scientists might be interested in having protection for their inventions, if you have any idea that in your country it would be sound to create a solid and self-sufficient pharmaceutical industry, then I would tell you to enact a law to protect those inventions, and to create an atmosphere which would appeal to the inventors to come and invest in the pharmaceutical industry in your country, but I would say at the same time that you should not put too many hurdles in the way.

Shri Kashi Ram Gupta: Are the pharmaceuticals produced in France consumed in the country to a greater extent than they are exported? Or are the exports more than the consumption in the home-country?

Mr. J. F. Monnet: If you mean the products of our manufacture in my country or in my factory, I may tell you that we export about 40 per cent of our production. If you mean the production by our licensees or other associates, then the figures are completely different, of course. Take, for instance, largactil which is the first tranquilliser that we have invented. This is sold in the USA ten times more than in France.

Shri Kashi Ram Gupta: Are there American patent-holders in your country, and if so, are they doing some research in your country?

Mr. J. F. Monnet: I was referring to a product of our invention on which we have patents in the USA, and which we have licensed over there. In France, the reverse is true; there are plenty of patents belonging to the American patentees, which are exploited in France either under a licence from the patent-owner or through a subsidiary of the American company.

Shri Kashi Ram Gupta: Have you got some patents in India?

Mr. J. F. Monnet: We have tried, but as you know, for the last five or six or seven or eight years, you have not been issuing any patents on pharmaceuticals, and therefore, we did not have to make any application for patents. But we are certainly interested in having patents and working them in this country either through our subsidiary or through licences.

But there is one point that I would like to raise at this time. In companies where there is a big research centre, very often, we make a selection out of the products that we invented and this selection is based on our estimation of the value of the best product that we could market. This selection is necessary for one reason only, but it is a good reason and it is that when you are in this business, it is not possible to promote in trade more than one or two new products each year; promoting the rest is more or less a fallacy. If each year you gave the commercial people twenty or thirty new products to market, they would not be able to do it. Therefore, we are obliged to select from our inventions. Among the products that we discard surely, there will be some which might be marketable by other companies which may not have the same selection as we have. As a matter of fact, we do not market all our inventions, and we do grant licences to other pharmaceutical houses in France for the products we have discarded for reasons which were not too serious. When we cannot market a product competing with others in our trade we go into competition by granting a licence to another pharmaceutical company.

Mr. Chairman: Thank you very much.

Mr. J. F. Monnet: I thank you and your associates here who have been listening to me patiently and who have made it possible for me, with my poor English, to give my evidence.

(The witness then withdrew).

(The Committee then adjourned).

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Monday, the 11th July, 1966 at 09.40 hours.

---

1. Dr. T. R. Govindachari, Director, CIBA Research Centre, Goregaon, Bombay.

(The witness was called in and he took his seat).

Mr. Chairman: Dr. Govindachari, we are sorry we had to keep you waiting because we had to get the quorum. Whatever evidence you give will be printed, published and laid on the Table of the House. Even if you want something to be confidential, that also will be circulated to the members of the committee. We have received your memorandum. It has been circulated to all the members. If you want to make any new points or to emphasise any particular point, you may do so. Afterwards, members will put you questions.

Dr. T. R. Govindachari: Let me first of all thank the members of this committee for giving me an opportunity to present my views personally before them. I am the Director of the CIBA Research Centre, Bombay, set up 3 years ago to carry out research on pharmaceuticals and dyestuffs.

I would like to ask three questions and answer them myself. Firstly, are

---

*Their Evidence was read together.

patents essential at all in the pharmaceutical field? My view is they are absolutely essential. Secondly, is the period of 10 years suggested adequate or not? I feel it is absolutely inadequate.

The third question is whether process patent should be granted or product patent. I feel that product patents are absolutely essential and process patents, in my opinion, are not adequate.

Let me explain these three points. First of all, talking from personal experience as the Director of the first laboratory for research set up by private industry in India—this was set up in 1963—I may say that we started operating on 1st January, 1963 though our laboratory was declared open by the late Prime Minister on 21st March 1963, with an investment of Rs. 3 crores and our annual recurring expenditure has been of the order of Rs. 50 lakhs. During the last three years we have made about 4000 new substances which have been tested—biological activity. We have filed nearly 20 patents. Of the 4000 substances which we have tested, only one substance has been sent for clinical trial. That was almost ten months ago. Two other substances have been sent for clinical trial two months ago. Probably, in the next year we may be sending out some three substances more for clinical trial. In all, out of 4000 substances which have been tested, hardly six or seven have a possibility of being used in the clinic. Even out of these six or seven, how many will actually prove to be effective as a drug is a matter which is open to question. My estimate is, it takes at least a minimum of 6 to 8 years, from the point of synthesis of a new substance with potentialities of becoming a drug to the point where it becomes a commercial possibility. In our own experience—we have been operating for more than 7½ years—only one substance which we made about 2 years back and found to have some pharmaceutical possibilities has been tested in the clinic during the past ten months. These tests have now to be enlarged and that will go on for another two or three more years before we can take a final decision whether it is worthwhile to introduce this drug at all. You can see, therefore, the enormous effort and the expense needed for the development of a new drug. If it takes 6 to 8 years to develop a new drug, you can imagine, by limiting the patent to ten years you hardly give any time to recoup the investment which has been made. New drugs will never come out unless you have vigorous and broad based research work activity. This is the first instance in India of CIBA setting up a research unit, and it may be that by the time we come out with a new drug we would have spent at least Rs 10 crores to Rs. 15 crores. In all possibility the drug may not be a commercial success and we may not be able to recoup the investment. If we are very lucky, very fortunate in hitting upon something which is widely sold all over the world, then we may be able to recover the investment made. Also, our drug research is not aimed particularly to Indian needs the research is aimed at producing drugs that will be useful all over the world. Therefore, if the drug is successful, it is bound to give us back, in terms of royalties, foreign exchange also. The only hope which people who invest money have is that some successful drug will come out. Unless you have patents there is absolutely no way of recovering the investment made. After all, what should go to shareholders is being spent for research now in the hope that something will come out which will reimburse the investment. I feel, therefore, that patents are very essential if we are to stimulate research in India in this particular field. In the present law we have protection for 16 years. That is essential if there is to be any inducement for other pharmaceutical firms to start research on this scale.

Then I come to the question about product patent versus process patent. The apparent cause for advocating the latter is, if you have the process patent you do not protect the product at all. Somebody else may come out with a cheaper process for the same drug and make it available to the public at a cheaper price. This, I think, is not completely correct because any person who discovers a new product is not going to leave any loopholes, is going to think of all possible and conceivable methods of making a particular product. Somebody else may claim that he has developed a new alternate, cheaper process. He would claim that he is making the product by the new method. But as I explained earlier, it is unlikely that he has a cheaper process. In fact he may be making it by the original method ' and there may be no way of proving it. This will only lead to abuse of the patent system instead of helping the man who has invested so much time, effort and money on research.

These are three points that I wanted to make clear If there are any questions I would be happy to answer.

Shri Kashi Ram Gupta: In your memorandum you have said that on a scientist you spend about Rs. 1.5 lakhs to Rs. 2 lakhs. The picture you have given roughly comes to this that for research in an industry it requires a crore of rupees. Am I correct?

Dr. T. R. Govindachari: It depends upon the size of the research unit. We calculated that roughly it takes Rs. 1.5 lakhs per scientist. You must have a minimum size. You cannot have one or two people working and expect them to produce any result. You have to have a particular set up wherein there are 10 or 15 people working together, to inter-act and stimulate each other. If you have only one or two people struggling by themselves, there is not even cross-ventilation of ideas. We are in a new place. We spend Rs. 50 lakhs a year on our recurring expenditure.

Shri Kashi Ram Gupta: You said that there should be 20 senior scientists, assistants and so on. It may even go to Rs. 1 crore and not Rs. 50 lakhs.

Dr. T. R. Govindachari: We cannot immediately start on a larger scale. We have started on a scale which we believe will produce results. If the results are encouraging we will expand.

Shri Kashi Ram Gupta: Generally it is said that 3 per cent of the sales is spent by the industry on research. Your industry must have about Rs. 15 crores output yearly. It means, naturally, that this industry should flourish in this country. It has a very high capacity to produce and a huge amount should be invested. Is that the picture of the industry in this country?

Dr. T. R. Govindachari: Actually I would say, 3 per cent is not correct as far as pharmaceutical industry is concerned. It may be that other industries spend of that order, but pharmaceutical industry spend much more than any other industry I am not a commercial man, and I do not know what relation it bears to the actual turnover of CIBA.

Shri Kashi Ram Gupta: You have said that ten years will not suffice. Is it from the date of application or from the date of specification?

Dr. T. R. Govindachari: Date of application. After one year you have to file complete specifications. Actually we have filed about 18 patent applications so far. Of these 18, we have submitted three or four in the course of one year, and more work has shown that some compounds which we sought to protect by patents may have undesirable effects and may

not find use as drugs; in these cases no useful purpose will be served by holding on to the patents. So, even when we take a patent its survival cannot be taken for granted. It is not unusual that even though the initial results with some compounds are encouraging, when we do more detailed studies we find that they are not as useful as we thought them to be and we drop the patents.

Shri Kashi Ram Gupta: You are suggesting 15 years from the date of completion of the specification?

Dr. T. R. Govindachari: From the date of first application.

Shri Kashi Ram Gupta: If we give ten years after the date of grant of the patent, have you any objection to that? It will be ten years from the date of sealing.

Dr. T. R. Govindachari: I think it would be inadequate. We have a drug with anti hypertensive activity which is being tested in the clinic. It seems to be promising in the preliminary trial. We have tried it for the last ten months on some 35 patients. We know the drug is well-tolerated when it is administered for a period of two or three weeks but, then, these anti-hypertension drugs have to be administered practically throughout man's life. So that, we cannot use or take for granted the results of short-term toxity until we carry out extended studies for one year. This involves feeding the drugs to animals for a period of 6 months to one year or more to see whether it is safe for chronic use in human beings. We have not started such a chronic toxity study yet. Even if we start the study tomorrow, it will be only one year later that we will be able to try it on an expanded scale in the clinic. Then we should gather data from a 1,000 patients which may take another three years. So, from the time of getting the patent it will take 7 years to introduce the drug in the market. Therefore, a ten year period is too short.

Shri Kashi Ram Gupta: You want 15 years from the date of application. We are giving ten years from the date of sealing of the patent. So, it will come to the same thing.

Dr. T. R. Govindachari: I have no experience as to how much time it takes after the first application to the date of sealing a patent, because we have started only three years ago.

Shri Kashi Ram Gupta: You say that we will be able to export our drugs. But up till now we have not produced even those drugs for which patents are originating in this country. So, how can we think of exporting at this stage?

Dr. T. R. Govindachari: We have filed our patents in 27 countries. If the drugs prove useful and successful, if they are superior or as good as existing drugs for particular ailments, there is every chance of their being exploited internationally. In that case, CIBA of India, which has made investments, will get royalties from those countries.

Shri K. K. Warior: I would like to know whether the patent right gives you a monopoly of the market.

Dr. T. R. Govindachari: Yes, monopoly as far as that particular drug is concerned, for a period of ten years.

Shri K. K. Warior: What kind of control would you like the Government to have so that the price charged by the company is reasonable to the consumers?

Dr. T. R. Govindachari: The pharmaceutical industry is a highly competitive industry. There are at least a dozen firms which are spending enormous amounts of money on research and which enforce the highest standards in the preparation of drugs. If our drug does not compare favourably with other drugs, there is absolutely no chance of its getting a market. We have always to make sure that our drug is as good as, if not better than, other drugs in the market. Also, we have to sell in a highly com-

petitive market. Suppose the price of our drug is ten times the price of another drug of almost the same quality and effectiveness, nobody will buy our drugs. So, the prices have to be realistic. At the same time, it has to be remembered that enormous sums of money which could have been paid as dividend to the shareholders are being ploughed into research. So, at least at a future date, the shareholders must get back that money. Further, I do not think anybody can afford to charge an exeessive price. Then again, in the case of every important drug in the first two years they try to recoup the money that they have spent on research. Later on, the prices come tumbling down to 30 or 10 per cent of the original price. This has happened time and again. Also, there is always the danger of your being overrun by somebody else with another superior product.

Shri K. K. Warior: It has come to our notice that some of the drugs patented in India are not produced here but actually imported into India as end product. The Indian price of those drugs is four times the international price. The international price of such drugs has been fixed after taking into account the money spent on research etc. The Indian consumer of such drug is precluded from getting them at the international price. What protection should the Indian consumer be given in such cases?

Dr. T. R. Govindachari: Naturally, I have no idea of the commercial aspect. But I could tell you that the prices in India are high because we do not have any organic chemical industry.

Shri K. K. Warior: I am referring to imported products, not those things which are produced here. And they are imported from countries where the chemical industry is far advanced. They have the know how and they have recouped their expenditure on research. They are selling their products in India at four times the international prices.

Dr. T. R. Govindachari: I cannot tell you, because I have no idea.

Shri K. K. Warior: We could also get those substances at those prices but, then, the patents come in the way.

Dr. T. R. Govindachari: I would answer this question this way. Suppose there is no patent. With the present state of affairs in India, when there is no organic chemical industry, is it conceivable or possible to prduce drugs at a cheaper price? It is impossible, because we do not have a fine chemical industry on which the pharmaceutical industry can depend for its intermediates. Take benzene which is a primary starting material. It costs in India ten times the price obtaining in other countries. So also the prices of sulphuric acid, nitric acid and caustic soda. So, suppose you abrogate or abandon patents and start producing them yourself, you are not going to produce them at cheaper cost. I can assure you that. Secondly, the abrogation of patents will stop whatever incentive there is for research to come up in this country.

Shri K. K. Warior: I was not referring to the import of raw material or intermediates but finished products which cost four times the international price in India because some companies have monopoly rights in them through patents. Could you suggest some way by which the Indian consumer will not be exploited?

Mr. Chairman: He is a scientist. He cannot speak on prices.

Dr. C. B. Singh: I am glad that you have laid stress on research. I am also glad that you appreciate that hardly any research is being carried out in India, either in the drug laboratories or in the Government institutions. What is the reason for lack of progress, so far as new drugs are concerned? Why is it that the Indian scientist has not been able to produce worthwhile results?

Dr. T. R. Govindachari: The main reason is that the scientific research in this country got impetus only after Independence. Before Independence, there was practically no interest in

research at all. Of course, the C.S.I.R. was started before Independence but it was just a very nominal thing. It is only after Independence that we have really made some progress. It takes time for a proper climate to be created. I feel hopeful that if you encourage research by encouraging private sector also along with public sector to set up research laboratories, we can still make good progress. We have the people and we have the ability. It is only a question of time before we can catch up. The more important thing is the question of organisation. It is not merely enough to have good people. You must be able to put them together and give them all the facilities without interfering too much. You must give them some amount of freedom. It takes time. In our country, the administrative outlook has been quite different so far because it has been striving to maintain the *status quo*, to keep things just going as they were.

Dr. C. B. Singh: You have used the word 'freedom'. I would like to know whether there is something which is interfering with your work.

Dr. T. R. Govindachari: For example, in my Institute, nobody tells us what to do and what not to do. We have taken up an assignment to produce drugs and all our ideas and all our efforts go into that. Nobody tells us, "Don't work on this problem or on that." We just do what we like Nobody questions us whether we spent more on a particular thing. We have the freedom to spend as we like.

Dr. C. B. Singh: I agree on that. You know that more than 6000 Indian scientists are abroad and they are unwilling to return back to this country.

Dr. T. R. Govindachari: Yes.

Dr. C. B. Singh: Why is it so?

Dr. T. R. Govindachari: It is because we still do not have enough laboratories and enough research institutions in a country of our size and our population.

Dr. C. B. Singh: What about their emoluments and other facilities that the scientists get in this country?

Dr. T. R. Govindachari: There also, comparatively, they are much lower at present.

Dr. C. B. Singh: I thought you will say so in a direct manner. You don't reply in a direct manner. Their emoluments are poor. That is my impression also. Apart from that, is there anything else that is standing in the way?

Dr. T. R. Govindachari: Adequate research facilities are also not available.

Dr. C. B. Singh: Agreed. Suppose we create a cadre for our scientists. You know that a scientist can at the most become a senior Research Assistant or something like that. They go from pillar to post and they have no future. Every scientist cannot become a Director and has the highest powers and all the amenities. So, a really good scientist can at the most become a senior Research Assistant or a research worker in our national laboratories or in other departments. Is that correct?

Dr. T. R. Govindachari: That is true. Recently, the C.S.I.R. has initiated steps whereby at the end of five years, they are automatically promoted to the next higher cadre.

Dr. C. B. Singh: Exactly that is what I am coming to. So, you are in favour of having a cadre for the scientists.

Dr. T. R. Govindachari: Yes.

Dr. C. B. Singh: You have mentioned in your memorandum that this CIBA Research Centre is spending Rs. 50 lakhs. May I know what is the annual turn-over? I do not want to embarrass you. If you do not want to reply, you need not reply. Actually, I want to know what proportion of the turn-over, on an average, a pharmaceutical firm spends on research.

Dr. T. R. Govindachari: Honestly speaking, I have no idea.

Dr. C. B. Singh: All right. You being the head of the Department do not know how much is spent on research.

Dr. T. R. Govindachari: I know how much I spend.

Dr. C. B. Singh: According to you, what proportion of the total turn-over will be a reasonable amount for a pharmaceutical firm to spend on research?

Dr. T. R. Govindachari: It has been suggested by many experts that it should be about 10 per cent. That has been suggested all over the world. I think some pharmaceutical firms are spending much more in other countries. The other industries may not be spending that much. But pharmaceutical industries are entirely based on research. Some may be spending more than 10 percent.

Dr. C. B. Singh: You are only a scientist. So, I will not ask many questions.

Now, about the product patent or the process patent, there is a lot of controversy going on. We are at the moment concerned with the process patent. Do you think the process patent is not sufficiently effective?

Dr. T. R. Govindachari: I feel that is not effective.

Dr. C. B. Singh: Why? You are a scientist and you should give a scientific explanation.

Dr. T. R. Govindachari: When a particular research unit develops a new product, there may be 25 different ways of making this product and any intelligent group of people working on a particular product will certainly think of all the conceivable methods of making that particular product and cover it by a patent. Supposing somebody comes along and says that he has made it by an entirely new process, it is very difficult to check it whether it is true or not.

Dr. C. B. Singh: Supposing we stick to our ground of having a process patent, would you like to have any safeguard sagainst that contingency which you have mentioned? Would you like us to incorporate a provision whereby the burden or proof will lie on the other person and not on the patentee? As the things stand now, the burden of proof lies on the patentee himself. Would you like to have a safeguard by which the burden of proof will lie on the other person proving that his process is entirely different?

Dr. T. R. Govindachari: That will be preferable. That will be a definite improvement. Actually, I do not feel very happy about the process patent.

Dr. C. B. Singh: That is all right.

Shri Dahyabhai V. Patel: I do not want to know any of your trade secrets. I would like to know from you only this. Since it is a well known fact that the Indian system of drugs and medicines is mainly confined to plants and 'mentals—the Ayurvedic science—are you conducting any research on some of the known specific Ayurvedic remedies?

Dr. T. R. Govindachari: We are doing a lot of research on Indian medicinal plants. During the last three years we have screened nearly 300 plants which are said to have medicinal value. Although we have not been able to show on experimental animals that they are effective—so far we have no encouraging results we have isolated several important compounds which have very interesting biological activity and which, if pursued in the next 5 or 10 years, may lead to something very new. So we are doing active work on the medicinal plants of India.

Shri Dahyabhai V. Patel: Are you not doing anything on the metallic side?

Dr. T. R. Govindachari: We are not doing anything on that side. We are doing just on medicinal plants.

Shri Dahyabhai V. Patel: You do not feel very much encouraged by what has been done so far? Is it in a stage where you are not able to say anything?

Dr. T. R. Govindachari: We have taken up several indigenous drugs, for which many claims have been made, for example, anti-diabetic drugs. But actually we have not been able to show on experimental animals that they are very effective. Still I would not say that all the work is a waste because we have been able to isolate many compounds which have very interesting biological activity and which may prove to be of great value; if pursued further.

Shri A. T. Sarma: According to Clause 53 of the Bill, the term of the patent for drugs and medicines will be ten years and for other inventions, fourteen years. In your Memorandum you have clearly stated that the time limit for patents provided in the Bill should be abandoned. But now you have tendered an evidence that ten years would be insufficient. Can you give clearly your idea about this?

Dr. T. R. Govindachari: The present patent law gives protection for 16 years.

Shri A. T. Sarma: My point is this. In the Memorandum you have suggested total abandonment of this Clause, i.e.,

> "the proposed curtailment of the validity period of a patent be abandoned".

Dr. T. R. Govindachari: Yes; that is my view.

Shri A. T. Sarma: But now you suggest that the period is not sufficient. There is a vast difference between these two. I want to have your clear idea about this.

Dr. T. R. Govindachari: The existing patent law gives protection for a period of 16 years which, I think, is a reasonable period. The proposed patent law reduces it to ten years. I feel that it takes at least six to eight years to develop a new drug and the persons producing a drug will hardly have two or three years at the most to get anything out of their discovery and so, the period of ten years is very small.

Shri A. T. Sarma: Do you want 15 years?

Dr. T. R. Govindachari: I want the existing period of 16 years to continue.

Shri A. T. Sarma: Here these ten years and fourteen years have been calculated from the sealing of the drug. According to you, almost seven to eight years would be gone from the time of filing a patent to the successful introduction of a new drug, and so you have suggested 15 or 16 years. The Bill actually provides for ten plus seven years for drugs and medicines and fourteen plus seven years for the other inventions. So I think you will be satisfied with this provision.

Dr. T. R. Govindachari: The present Bill does not satisfy me.

Shri A. T. Sarma: You want 15 or 16 years from the date of filing whereas we have provided from the date of sealing.

Mr. Chairman: Mr. Kashi Ram Gupta has already asked that question and he has given an answer that ten years from the date of sealing would be sufficient.

Dr. T. R. Govindachari: What I feel is that it depends on the date of sealing. Suppose we file a patent this year and it is sealed in two years' time; that means, we do not get more than 12 years. So it depends on how long it takes to seal the patent.

Shri R. P. Sinha: I would like to know from the learned witness as to what kind of research is being carried on in his Institute. We are told that there are three types of researches—basic research, product development

research and formulation research. Are all these types of researches being carried on in your Institute or only one or two?

Dr. T. R. Govindachari: In our Institute, we are doing only basic research. We are not interested in product development or formulation at all. CIBA of India has a factory producing pharmaceuticals and there they do the product development, but we are concerned only with developing new drugs and we do not bother about processes for the existing drugs. All our efforts go into discovering new drugs.

Shri R. P. Sinha: I would also like to know from the learned witness whether there are other such institutes carrying on similar basic research on pharmaceuticals or CIBA is the only concern which is carrying on this type of basic research.

Dr. T. R. Govindachari: As far as the private sector is concerned, CIBA is the only place where research for the discovery of drugs is done. In the public sector, we have the Central Drug Research Institute, Lucknow, which has been working for the last 14 years, and where they are doing work on developing new drugs. The Regional Research Laboratory, Hyderabad, has also a small section working on discovery of drugs.

These are the only three institutions where some effort is made for doing basic research in pharmaceuticals.

Shri R. P. Sinha: Is there any liaison or close co-operation between your Institute and the Central Drug Research Institute and the Regional Research Station at Hyderabad?

Dr. T. R. Govindachari: We do not have any direct connection at all. But I was on the Executive Council of the Central Drug Research Institute for several years and I have visited the Regional Research Laboratory, Hyderabad, very frequently purely on a scientific basis for addressing meetings, working on selection committees and things of that sort. But with day-to-day working there is no liaison because the research which we do or the research which those people do is kept confidential. As far as new developments are concerned, they or we would like to have the credit for making new discoveries; if it is widely known, then we lose all the credit.

Shri R. P. Sinha: Do you mean to say that it is the usual practice in foreign countries also that the different research institutes carry on their work in isolation, in secrecy, and they do not share their research development programmes?

Dr. T. R. Govindachari: Two types of work are carried out in all these institutions: first there is the basic research which may bring about new reactions and which is published widely in scientific literature; then there is the actual practical evo'ution of drugs on which some very useful information has been obtained and which may be of practical value and this is kept confidential till the time of introduction because it is a question of investment of money in research and people expect some return for all the money that they have spent; they do not want a competitor to steal their ideas and by using those, produce the thing a few years ahead of the original discoverer. It is a common practice in all such cases, where things which may be of practical va ue are concerned, to keep the information secret.

Shri R. P. Sinha: The witness has said just now that he was on the Research Committee of the Indian Drug Research Institute for several years. I would like to know as to what his experience is; what type of work is being done there, whether they have evolved any worthwhile drugs and taken out any patents?

Mr. Chairman: We are going there.

Shri R. P. Sinha: I would like to know his views, Sir.

Mr. Chairman: He is only on the Executive Committee. I do not know whether he can answer your question.

Dr. T. R. Govindachari: Actually the Executive Council has the task of making grants and sanction of expenditure and also going through the research programme. I think the CDRI scientists have also been quite active and doing good work in several fields, especially medicinal plants and also in fertility control. One thing really difficult in India is the translation of the laboratory results to actual clinical practice especially in this field; it requires a great deal of experience. To tell you frankly we ourselves are facing a great deal of difficulty in getting our drugs tested properly because in India the tradition of developing our own drugs is new. The drugs which have been introduced in India have all been tested thoroughly in other countries and only when they are absolutely sure of the results, they are handed over to the Indian dealers. Production of new drugs entails a lot of responsibility and enormous amount of time and money. Unfortunately, we have yet to develop that mentality in the clinical profession and try out our own drugs.

Shri R. P. Sinha: From what you have just now stated it appears to me that clinical testing in this country will take longer time than the clinical testing in advanced countries. Have I correctly understood you?

Dr. T. R. Govindachari: You are absolutely correct because it is a question of getting our clinical people to take interest. They are very very busy people, the top people. We cannot afford to have our drugs tested by ordinary physicians. We would like it to be done by the most competent people and generally the most competent people are also the busiest people in our country. You know our problems are much more and the number of obstacles is much more and the doctors are less in number and consequently there is greater pressure on them than on the doctors abroad. Clinical trials will actually be the biggest obstacles in developing new drugs. Recognizing this need, the CSIR has actually agreed to set up clinical trial units in various parts of the country. They are prepared to give grants so that the best physicians, who are very busy people, may employ more assistance. Even in the research laboratories of CSIR they have this difficulty. In their research laboratories thousands of compounds are being prepared but they are inadequately tested. The first stage of developing a drug is screening in animals; for this purpose, a good sized animal house with facilities of breeding and maintaining colonies of different species of animals is necessary. Adequate facilities are lacking in this respect in the CSIR laboratories. After effective animal testing, come clinical trials. This is a bigger problem and the CSIR itself has realised that it is very dffiicult to get this done. So they have mooted the idea of having clinical units in various parts of the country. Actually one such unit has been set up in Bombay under Dr. U. K. Sheth at the KEM Hospital. Like that they are setting up other units also. So, clinical trials constitute a big stumbling block in producing the new drug. Therefore the delay in developing something new is going to be even more than what is normally estimated abroad.

Shri R. P. Sinha: Could you give us information as to how much time it takes after faking all factors into account and the difficulties also, for completion of the clinical research and the establishment of the drug clinically in this country and how much time it takes in other advanced countries, because this will have a direct bearing on the decision we will take on the period of patent?

Dr. T. R. Govindachari: The question is rather difficult to answer. So far not a single drug has been developed in India. We have only borrowed from other people and put it in the market. In other countries it takes a minimum of 6—8 years from the time of discovering the biological activity. I feel it will take at least 2 more years here. From my own

experience, we have a compound which is supposed to be a very good anti-hypertensive drug. For the last one year we have been able to get only 35 cases and now we are trying to get it tested more actively in several other centres. The physicians tell us that they would like to have a longer trial extending over a period of 6 months. That means that it will have to go back to the laboratory for chromic toxicity study in animals and it may take one more year to make absolutely sure that prolonged administration does not do any harm. Even after the results are ready, it will take another 1½ years. Then we go back to the physicians and say, 'Now the drug is safe. We will give you this drug. You will try it for this period.' This will take at least another 4 years if at all it survives all this critical and very very rigorous testing. We have only got 4-5 compounds which are worthy of going for clinical testing out of 4,000 substances we have made and tested in our laboratory. They say one in three thousand has the chance of becoming a drug. I hope at least one in 4,000 will come out.

Shri R. P. Sinha: I would like to know about this particular drug. I would like to understand the procedure so that I may apply my mind. When was a patent taken for this particular drug which you have referred to?

Dr. T. R. Govindachari: We have filed the patent application.

Shri R. P. Sinha: At what stage?

Dr. T. R. Govindachari: That is after almost one year of working in the laboratory and experimenting with animals. We have to do several elaborate tests. The first test is to try it on dogs. That is a routine test, for seeing whether there is a fall of blood pressure. Then you have to do toxicity tests: upto what dose is it safe? What is the lethal dose and what is the relationship between the lethal dose and the therapeutically active dose? We have to do a very large number of experiments. All these will take at least a year before we can say that it is ready for clinical trial but the moment we knew that it is likely to be of value as a drug we applied for patent.

Shri R. P. Sinha: After you have applied for the patent, you say that the final specification with regard to this patent can be filed only after you have completed the clinical tests.

Dr. T. R. Govindachari: After the initial discovery of this compound we have to make at least 150—200 other compounds very closely related in structure so that we can pick out the best of the whole lot. This again means going back to the laboratory and making more and more compounds. That is a process which takes time. So at the time of filing the first application, we are given one year time to file the complete specification. In this period we have to do all this work, to try and make a number of compounds and have them tested quickly and pick out the best.

Shri R. P. Sinha: Within one year you have to file the complete specification and then you start the clinical test. Then only after you have satisfied about the clinical test results it takes, as you say 5 or 6 or 7 years and then you apply for the patent. Am I correct?

Dr. T. R. Govindachari: I do not know what exactly sealing of the patent means.

Shri R. P. Sinha: Grant of patent.

Shri K. V. Venkatachalam: The two things are different. Once an application goes to the Patent Office there is a separate system of procedure. They examine it to see whether there is any novelty and if the Patent office is satisfied that there is novelty they accept the patent application and then publish it for objection.

That is a completely different judicial process that will be going on. The applicant for his patents will be doing clinical tests independently. After it is published, if no opposition is there, then the patent is sealed. It may be within six months. Or on the other hand, if there is opposition, it may even take two years.

Shri R. P. Sinha: So, from the date of the filing of specifications you start the clinical tests and then it takes about five or six years. Does the Central Drug Research Institute also take the same time in regard to this clinical research? Have you got any idea?

Dr. T. R. Govindachari: I think they must be having the same difficulty as we are having.

Shri R. P. Sinha: I would like to seek one more information. In India we are spending a lot of money on research; the Central Drug Research Institute is there and now you have started your institute. In foreign count ies, I find that every important drug industry has its own basic research institute. Now can you tell us whether any other important drug manufacturer is thinking in terms of putting up institutes like the one which you have under your control and what effect this Patent Bill will have on their plans for putting up research institutes in India?

Dr. T. R. Govindachari: I know that Hoechst has been thinking of starting such an institute; they have been coming to me regularly.

Mr. Chairman: But is there any institute like the one you have?

Dr. T. R. Govindachari: No.

Shri V. M. Chordia: In India, many of the products which are patented are produced by foreigners or in collaboration with foreigners. Indian patents are only nominal. If we extend the period of the patents, will not the benefit go more to the foreigners and less to the Indians?

Dr. T. R. Govindachari: The cost of production of pharmaceuticals in India is high not because of the patent law, but because the raw materials required are very much expensive—ten times more expensive—and, therefore, even by abolishing or limiting the patent period, you are not going to enable the Indian manufacturer to produce it at a much lower cost.

Shri V. M. Chordia: I have got a list of medicines here which shows that the initial marketing price was too high but the subsequent marketing price was very low. For example, take Vitamin B-12. The initial marketing price was Rs. 2,000 per gram and the subsequent marketing price was Rs. 40; the initial marketing price of Streptomycin was Rs. 19 per gram and the subsequent marketing price was Re. 1 per gram, and so on and so forth. How do you justify it?

Dr. T. R. Govindachari: It is very easy to answer this question. Take the Streptomycin case. In the initial stages, the process may be costly, but constant research goes into improving the process. For example, it is very well known that they now produce strains of micro organisms which yield more streptomycin by irradiation or with genetic changes. It takes a lot of time to develop new strains of these micro organisms capable of producing a better yield. It is not done all at once. In the initial stages they have something to go on and they introduce it. But they do not keep quiet. They go on improving the process. For example, the yield of penicillin in the initial stages was very low; but by discovering certain strains which are giving high yields of penicillin, the cost of production has been brought down. So only after a period of time, the cost of production can be brought down. It takes five years or

so from the point of discovering the usefulness of a drug to finding new ways of making it at a cheaper price.

Shri V. M. Chordia: Are you aware of the fact that many companies charge a lesser price in foreign countries but charge a higher price in India? For example, Tolbutamide (Hoechst) in many European countries is sold at $1·85 for 50 tablets, while in India it is $3·57 for 50 tablets. The price of Chlorpropamide (Pfizer) in Italy is $1·41 for 60 tablets (250 milligrams), while in India it is sold at $4 for 60 tablets (250 milligrams). There is a long list like this. How do you justify this?

Dr. T. R. Govindachari: Actually I am not competent to answer this question. I have no idea at all. But at the same time, my point is that by by restricting the patent period, you are not going to improve the position. You are only going to destroy whatever incentive there is to put up an industry or to do research in this country. Unless the basic organic chemical industries are set up and intermediaries and primary starting materials are made available at international prices, it will never be possible to produce any drug at competitive prices in this country even if we abrogate the patents law.

Shri V. M. Chordia: My impression is that in India in spite of the old Act which permitted us to have a long period of patent, we could not invent new things and even if we have invented, they are only a nominal number of things. The new inventions are done mostly by foreigners. Now we are in a position to imitate them; then after imitating, we are in a position to improve them; and in the third stage, if we could learn something, we could invent new substances. Under these circumstances, will it not be better if we reduce the period of the patents? The foreigners' patents will lapse after ten years and after that, the Indian manufacturers with their own initiative can imitate their products and sell in the market and thus save foreign exchange also.

Dr. T. R. Govindachari: Let me give the answer to this. At least 80 percent of the drugs which are currently used are drugs on which patents have expired 25 or 30 years ago. None of these you are making in this country at a reasonable price. Take Aspirin for instance which is a very common thing. It has been known for hunded years. It is only recently, 5|6 years back, we have started manufacturing it in this country. For the Indian manufacturers, there is a vast field of drugs on which patents have expired 10, 20 or 30 years ago and no attempt is being made to make these at a reasonable price. If at all they produce they have to import foreign know-how set up a plant and the prices are finally not cheaper than what we being offered by foreigners. I do not think that merely abolishing patent will help, because nothing is being done with the products on which patents have expired long ago. More than 80 per cent are not being made in this country. Why pick out 20 per cent covered by existing patents and curtail the rights of the investors? This will take away incentive to people to invest money and discover something new. You are cutting down whatever incentive there is without benefiting anybody.

Mr. Chairman: Do you know that Dr. Dey in Calcutta of Martin Harris is manufacturing aspirin with an entirely new process and this is more popular and cheaper than the other product.

Dr. T. R. Govindachari: Actually in foreign countries, aspirin is made on an enormous scale, although different names are printed on the product. It is made by one manufacturer, probably Bayer or somebody....

Mr. Chairman: Have you seen the factory? He has fabricated a machine himself.

Dr. T. R. Govindachari: That is exactly the type of thing that ought to be done.

Mr. Chairman: Such people should be given encouragement.

Dr. T. R. Govindachari: Definitely.

Shri R. Ramanathan Chettiar: In reply to a question by a colleague of ours here, you said that it should be only product patent and not process patent. You did not enumerate the reasons for coming to this conclusion. Would you please enlighten us?

Mr. Chairman: He has given it. He has extensively given this. Two people asked about it—I think Warior and Gupta.

Shri R. Ramanathan Chettiar: You have also remarked in the course of your observation that there has been no discovery in regard to any new product and no research has been done but may I ask you why steps are not being taken to find a remedy for common cold?

Dr. T. R. Govindachari: Common cold is a virus disease and actually we have very few drugs so far against viruses. Actually sometime in 1930, it was thought there was no cure possible for bacterial infections. Later on the sulpha drugs, phosphates etc. came in. Similarly for virus infection, at present there are practically no remedies except vaccination or immunisation, but I am sure with extended research some drug will be found. All the firms are having very active programmes in the anti-viral drugs field. We are also working on this. Influenza and small pox—on these two we are working very vigorously, testing all our products. If anything useful comes out, it will be a break-through in a field which has been considered to be inpenetrable.

Shri R. Ramanathan Chettiar: In your Memorandum on pages 3 and 4, you have stated that a scientist's cost, on an average, is about 150,000 to 250,000 per year. It means only the remuneration or....

Dr. T. R. Govindachari: I just calculated roughly. In our place we have 25 scientists, senior people and it costs 52 lakhs to run the place. This is because a lot of other assistance is needed, expenditure on chemicals, services—water, electricity—and things like that. It is a very rough way of looking at it. If you want an effective group, it requires so much money to run a place. My figure is an approximation arrived at by dividing the total expenditure by the number of scientists.

Shri R. Ramanathan Chettiar: I want to know—you would know from your experience, you have worked in foreign countries as well—whether 10 per cent of the total turn-over of the industry should be set apart for the research. Is it being done in the foreign countries by the pharmaceutical industry? We had a gentleman from Switzerland the other day, who said it should be only 1 per cent.

Mr. Chairman: He said some are spending more.

Shri R. Ramanathan Chettiar: The Swiss expert who came here who is also connected with CIBA said specifically the other day 1 per cent. I mean how could any industry spend as much as 10 per cent.

Shri Kashi Ram Gupta: He said 3 per cent, not 1 per cent.

Official from Ministry: You see the Japanese figures. They are as much as 25 per cent.

Shri R. P. Sinha: In America it is 53 per cent of the turn-over.

Dr. T. R. Govindachari: Actually in pharmaceutical field, the industry spends the highest amount on research.

Shri B. K. Das: You have mentioned that 4 per cent royalty would be very inadequate. You have not indicated what would be the proper or adequate compensation. Could you give us an idea?

Dr. T. R. Govindachari: I do not think I can. I thought 4 per cent was too low. Really it is robbing somebody who has invested a lot of time and money.

Shri B. K. Das: You should give us an idea what would be adequate or at least near adequate compensation? What should be the basis of compensation? How it should be decided?

Dr. T. R. Govindachari: Actually I am not thinking on those lines at all. It is unfair to take away somebody's discovery and then give it away to somebody else who has not spent any time on it.

Shri B. K. Das: It comes to this that you are not at all in favour of compulsory licence.

Dr. T. R. Govindachari: Yes. I am not.

Mr. Chairman: You are in favour of product patent. A product may be manufactured by several processes. If we give product patent to one process, it will shut out research as regards the other processes.

Dr. T. R. Govindachari: It is always possible once you know that a particular product has a particular type of activity.

Mr. Chairman: You would be giving a monopoly to them.

Dr. T. R. Govindachari: After all the life line of a patent is not indefinite. It is for a period of 16 years at present.

Mr. Chairman: It may be even shorter. The life of a particular drug, with the scientific advance that is going on at a rapid pace, the utility of a drug, use of a drug may be limited to 5|6 years. If you give only product patents, it will be actually shutting out all discoveries or inventions for other processes.

Dr. T. R. Govindachari: My point is that a man who discovers a worthwhile product will think of all the theoretically possible ways of making that particular drug. He knows his subject. He will work out all the possible things in the laboratory. Other processes also will be covered.

Mr. Chairman: A doctor has given a suggestion that the burden of proof may be put on the infringer.

Dr. T. R. Govindachari: But it is a vexatious process to be all the time thinking of legal things.

Mr. Chairman: Take the case of Haffkins Institute. They invented a process altogether different from the old one. But they were frustrated by the foreign patentee and they were not able to manufacture, even though their process was new and the cost was nearly 1/4th of the foreign patent.

Dr. T. R. Govindachari: I submit, Sir, that you will have to examine these claims by such people rather carefully.

Mr. Chairman: Haffkins Institute is a very famous institute.

Dr. T. R. Govindachari: Sir, I submit that one must be very careful when claims are made that it is a cheaper process and all that.

Mr. Chairman: In the case of a research institute like the Haffkins Institute in Bombay, when it is a new method and a cheaper method, why should they be denied? Practically you are shutting out their discovery?

Dr. T. R. Govindachari: My point is that why should the person who makes the initial discovery be prevented from reaping the benefit of his discovery?

Mr. Chairman: Do you think that the return of the patent is more important than the health of the nation in a poor country like India?

Dr. T. R. Govindachari: I would not say it is so.

Mr. Chairman: If the health of the

nation requires that a product should be made through a cheaper process and in sufficient quantity, and a new scientist makes such a discovery, why should he be denied? Why should we give monopoly to the earlier patentee—the Indian or a foreigner?

Dr. T. R. Govindachari: Such cases are very rare.

Mr. Chairman: Why should it be shut out?

Dr. T. R. Govindachari: So that there may be some incentive for research.

Mr. Chairman: But that way you will be killing the incentive for research.

Dr. T. R. Govindachari: I am sorry I do not agree with you.

Mr. Chairman: You know some countries are thinking of restricting the patent period for drugs and articles of food. We are restricting it to ten years. Why should you object to it.?

Dr. T. R. Govindachari: Because I explained to you.

Mr. Chairman : There is the other view also. You said that no other foreign firm has started research institute of basic industries.

Dr. T. R. Govindachari: When this patent law and all that came in, they hesitated.

Mr. Chairman: The main object of a patent is to engage in research and mainly within the country. All the foreign firms are importing intermediaries and selling them in India. Do you agree with that?

Dr. T. R. Govindachari: The thing is you must remember there is no fine organic chemical industry in this country.

Mr. Chairman: The foreign patentees have not started research.

Dr. T. R. Govindachari: How can they start when in nine cases out of ten the starting materials are not available here, and there is difficulty in importing materials. Licences are there. We have to depend for all our fine chemicals on imports. Raw-materials are 5 to 10 times costlier here than in well-developed countries like Switzerland and Germany or England or USA. That is why people hesitate.

Shri K. V. Venkatachalam: Under the existing conditions, there is one school of thought that if you take away the patent system, the development will be quicker and more rapid. There is another school of thought that if you take it away, there will be a setback. What is your view?

Dr. T. R. Govindachari: I frankly think that if you take it away, the development expected to occur in the near future will not materialise.

Shri K. V. Venkatachalam: What is your assessment of the rate of progress of the pharmaceutical industry during the last 6 or 7 years?

Dr. T. R. Govindachari: There are administrative difficulties because nothing can be done without the concurrence of Government and it takes a long time to get any project through. Still, I think there has been considerable progress in the pharmaceutical industry. CIBA have put up a multipurpose plant 3 years ago which can make a whole host of pharmaceutical chemicals which were not being manufactured here before.

Shri K. V. Venkatachalam: If this Bill is passed, will CIBA's activities be affected in any way?

Dr. T. R. Govindachari: Yes. If other people start manufacturing the same things and selling them at cut-throat prices, naturally CIBA's profit will go down and correspondingly our research activities also will be affected.

Shri K. V. Venkatachalam: What is the exact relationship between your research centre and the main CIBA concern?

Dr. T. R. Govindachari: CIBA of India is an independent company with several divisions like the pharmaceutical division, pesticides division, etc. Ours is the research division and we do work on pharmaceuticals and dyestuffs.

Shri K. V. Venkatachalam: To what extent is your day-to-day activity directly related to any problems that CIBA may have in their pharmaceutical division or pesticides division, etc.?

Dr. T. R. Govindachari: Nothing at all. Our task is to develop new drugs and dyes.

Shri K. V. Venkatachalam: Is your annual programme approved by them?

Dr. T. R. Govindachari: There is no question of anybody approving or disapproving. We get funds from CIBA of India and we work and produce our results. As long as the Director enjoys their confidence, there is no question of approval or disapproval.

Dr. A. Joga Rao: From a study of the history of scientific development how is it possible to reconcile to your view that a single individual more or less possesses monopoly of all possible processes for a particular product? I shall cite three instances relating to the heavy chemical industry and the fine chemical industry. Among the heavy chemicals you are aware that caustic soda was being made using several kinds of cells. The devices and equipment and operations are different. So, there is a wide range of alternative techniques for achieving the same goal—caustic soda. Taking fine chemicals, hydrogen peroxide and ozone can be produced not by one method but by so many methods. It is not possible therefore to accept that all these methods must be conceived and thought of by the same individual apart from the fact as to whether that individual lays claims to them by means of patents or not. We cannot take for granted the ominiscience, so to speak, of an individual or organisations in such matters.

Take the polyhydric alcohols like sorbitol and mannitol. They may have some uses in the pharmaceutical industry, but they are also used in the tobacco industry and other industries. Patents had been taken out and they had expired. Is it not possible for you to conceive of their production by alternative processes? The history of science does not seem to me to bear out that it is the same individual who always has the ability to think and exhaust all possible processes for achi-achieving a particular goal.

Take the illumination devices. There are so many. If a broad patent is granted for light producing devices it will prevent others from developing different alternatives, the fluorescent tubelights for instance. So, a certain limitation is required to be imposed in granting patents.

You have experience of research in private concerns. You also have experience of fundamental and some applied research earlier in the Madras Presidency College. You have some knowledge of the researches and achievements of the CSIR laboratories also. Do you think there is anything which is wanting in these later laboratories and institutes which if supplied may contribute to their working on more productive and fruitful lines such as in CIBA, for instance? After all, the same men (*i.e.*) scientific workers go from these places to these and may be, *vice-versa*, and generally it is agreed that the men are all right.

You know that in the beginning, say in Dr. Bhatnagar's time, the CSIR

was taking as many patents as possible in its name.

Afterwards, probably in the light of past experience or, I do not know, for some reason, it seems there was a change in the attitude so as should not to encourage the filing of patents but publish everything instead freely. Do you think the latter policy has helped in the conduct of better *i.e.* more productive research in these public sector laboratories.

Dr. T. R. Govindachari: You gave a number of examples to show for the same product there can always be new processes forthcoming. But there is always a world of difference among different fields. In the pharmaceutical field, where you have a specific organic compound, any capable organic chemist will definitely think of all possible ways of making it, between the date of filing the first application to the filing of the complete specifications.

Shri K. V. Venkatachalam: You are limiting it to pharmaceutical preparations only?

Dr. T. R. Govindachari: Yes, I agree that in the matter of caustic soda there are new methods which can produce it at a cheaper price. Here, in the case of pharmaceuticals, the compound has a specific organic structure and the number of possible ways of making it is not unlimited. Any clever organic chemist can think of all the possible ways and it will be very difficult to pick a loophole. If you do not give a product patent but only a process patent, a competitor will make the product by some process which was already conceived of and claim it as a different method.

About the second point, it is all a question of emphasis and direction. In a private firm, people accept an assignment for a specific purpose and they try to do their best, whereas in a public laboratory the same amount of control is not there and people are allowed to do as they please. There is more of team work in a private laboratory.

Shri K. V. Venkatachalam: Why? It is due to the atmosphere or is it due to the psychological effect?

Dr. T. R. Govindachari: I do not know. My own experience is that there is more team work. Of course, some of the national laboratories are doing outstanding work. The people there are as qualified as the people we have. They have the same background, accomplishment and all that. But when we put them together I think there is less direction than what we have, and the orientation and the emphasis probably is not so much there. In our case, nobody tells us what to do. We are there with the task of producing drugs. Our first job is to discover something new which will be useful as a drug. We do not spend our time because it is not somebody telling us we should not do this or do that. It is a self-imposed discipline. We will work in a field which is likely to bring the quickest possible result. In a National Research Laboratory they work on something which may have long range benefits, which may be useful after 50 years, which may revolutionise the whole concept of science.

About the question of patents, I think the CSIR believes in taking patents. In the Food Research Institute, in the Leather Research Institute, people do take patents. In the matter of exploitation of patents the response has not been good and that may be the reason why there may be some slowing down.

Dr. A. Joga Rao: The CSIR was not stopping the taking of patents but they were trying to discourage it and as far as possible, except in very outstanding cases of inventions and of course invariably it had to be with the approval of the head of the department. As an alternative they thought publication of non-technical know-how would be more useful and anybody who was interested in a particular product or process was free to contact the CSIR directly and on

payment of some royalty or even freely they could get all the details about it. They seem to be of the view that that was the best way of developing indigenous industry.

About my first question, I am still not able to understand what you say. You say that in the pharmaceutical field it is possible to think of all possible permutations and combinations for a certain compound. If for an organic chemical compound, which is a very complex thing, it is possible to think of all possible combinations, it might be perhaps much easier in the case of a much simpler substance. Take for instance, cuprous oxide which is used in paints for the bottoms of ships. It is an antifouling ingredient. There are various grades. Chemically it may be Cu_2O. But from the point of view of its suitability for the purpose in view its fungicidal property and its stability to remain so without being oxidised etc., products from different sources may be differently. What you say amounts to this—that it should be possible here also and work out all possible ways of producing that substance which means that nobody else can produce the same substance, which is chemically the same and equally effective, by an alternative method. History does not bear that out; and current scientific literature constantly reveals many examples.

Dr. T. R. Govindachari: You are comparing entirely different fields which cannot be compared at all. In the pharmaceutical field a particular compound has a particular structure from the point of view of biological activity. Any organic chemist worth his salt will know what are the various reasonable ways of making that compound. He will take steps to see that all those steps are worked out and the cheapest and the most productive method is adopted. For somebody else to come along and say that he has found out a better method, the chances are one in a thousand.

Dr. A. Joga Rao: I can understand that a concern or body like yours will always think of trying to make the claims as broad as possible on the scientific side, so that others may not tread on their foot. But we in the patent office would prefer to allow claims which are limited and well defined.

Dr. T. R. Govindachari: The chances of developing new methods are so remote.

Shri Kashi Ram Gupta: You have suggested a board of expert scientists to scrutinise the claims for compulsory licence. Should it be an advisory board?

Dr. T. R. Govindachari: Yes, that is the suggestion.

Mr. Chairman: Are your researches open for exploitation by the public in India or are they exclusively for CIBA?

Dr. T. R. Govindachari: They are exclusively for CIBA.

Mr. Chairman: Suppose somebody in India wants to apply for a compulsory licence. Could he do so?

Dr. T. R. Govindachari: I think the present law does not allow that.

Mr. Chairman: Are you responsible only to the Indian company or your parent company?

Dr. T. R. Govindachari: To CIBA of India.

Mr. Chairman: It is a world-wide organisation and it has come in for a lot of criticism by the Kefauver Committee of USA.

Dr. T. R. Govindachari: I know the general trend of the Kefauver Committee Report. But I have not seen the specific criticism of CIBA.

Shri R. Ramanathan Chettiar: The witness has answered his questions on the assumption that the sellers' Market will continue. The research that he is doing is also based on that assumption. Does he not envisage an

assumption. Does he not envisage a situation in the not distant future when there will be a buyers' market in which case he will have to face competition?

Dr. T. R. Govindachari: Definitely. That is all the more reason why we should have patent protection when we have a buyers' market. When we have spent a lot of money, when we discover something very effective we must have the opportunity of getting back what we have spent. Otherwise, no concern will spend any money on research.

(*The witness then withdrew*)

II. All India Drugs & Pharmaceuticals Manufacturers' Consultative Committee, Bombay.

Spokesmen:

1. Dr. Gurbax Singh, *Leader.*
2. Shri G. M. Parikh.
3. Shri R. Ganesan.
4. Shri B. S. Giri.

III. All India Manufacturers' Organisation, Bombay.

Spokesmen:

1. Shri Hansraj Gupta, *Leader.*

2. Shri G. M. Parikh
3. Shri B. S. Giri
4. Shri R. Ganesan
5. Dr. Gurbax Singh

} *Member of the Central Committee*

IV. Sarvashri G. M. Parikh, H. J. Vaidya and S. C. Nanabhai, Zandu Pharmaceutical Works Ltd., Bombay.

(*The witnesses were called in and they took their seats.*)

Mr. Chairman: The evidence that you give will be published and laid on the Table of the House. Even if you want a particular portion of your evidence to be treated as confidential, that will be supplied to the Members of the Committee. We have received your Memorandum and that has been circulated to the Members. If you want to stress any particular point or make out any new point, you may do so. Afterwards, the Members will put some questions and you may answer them. I find that, by and large, you are in agreement with the provisions of the Bill and that there are very few points on which you differ.

Dr. Gurbax Singh: I have been asked to represent Dr. Basu here. Before I begin, I might mention that the All India Manufacturers' Organisation and ours are one and the same. We are representing manufacturers' interest only. If you have no objection, we may be heard together. That will be better and much easier. That will save the time of the Committee also.

Mr. Chairman: I have no objection. We can call them together. Mr. Parikh, do you want a separate hearing on behalf of the Zandu Pharmaceutical Works, Ltd., Bombay?

Shri G. M. Parikh: I leave it to you, Sir. I have no objection to be heard along with them.

Mr. Chairman: So, we can take up all the three groups together. The spokesmen representing all the three organisations, the All-India Drugs and Pharmaceuticals Manufacturers Consultative Committee, the All-India Manufacturers' Organisation and the Zandu Pharmaceutical Works Ltd. are here.

The evidence that you give is published and printed. It is distributed to all the Members of this Committee and also laid on the Table of the House and distributed to the Members of Parliament. Even if you want any particular portion to be kept confiden-

tial, it will be supplied to the Members of the Committee. Now, we have received your memoranda and they have been circulated to the Members.. If you want to stress any particular point or make out any new point, you may do so. Afterwards, the Members will ask some questions and you may reply them.

Shri Hansraj Gupta: With your permission, Sir, at the outset, I must thank you for giving us this opportunity to appear before this Commitee. We are also very happy that after all after a long waiting this Bill has come up. We have always been feeling that the old Indian patent law that has been prevailing uptill now has not been able to stimulate inventions and it has not been able to encourage the Indians to make more and more inventions. In any case, since we are concentrating on the various clauses of the Bill, I will point out only those clauses where we want certain amendments to be made.

With respect to clause 27, we would like that the applicant should be given an opportunity to show cause as to why his application should not be rejected. As the provision is, the Controller may refuse to give him the permission without consulting him on account of various reasons that might come to his notice. We think that that is not fair and that the applicant should be given an opportunity of having his say. After all, the Controller has got the right to reject the application. If the opportunity is given to the applicant, that will be better in the interest of all. What we are suggesting is that, in this case, the applicant should be given an opportunity to come forward and show cause why his application should not be rejected.

Clause 43 provides that patent rights shall not be deemed to be infringed when the patented article or the product made by the patented process is imported by or on behalf of the Government for the use of the Government and other organisations working under the Government. This grants unlimited powers to the Government and also militates against the basic objectives which are behind the grant of a patent. We submit that this power should be given only where the patent has not been worked for producing sufficient quantities to meet the requirements of the country. Otherwise, it would not be very fair.

Clause 53 is in respect of the period for which the patent is to remain in force. Here you have given ten years in some cases and fourteen years in other cases. We submit that the period of ten years is quite sufficient and in case the man comes forward and gives valid reasons, the period may be extended to 14 years; otherwise, it should be 10 years. Formerly, as a matter of fact, the suggestion was that the period should only be 7 years, but you have been good enough to make it 10 years. It should be extended to 14 years only in very special cases.

Clause 64 is in respect of revocation of patents. Here I would like to refer you to the following:—

> "Where the patent is for a process or for a product as made by a process described or claimed, the importation into India of the product made abroad by that process shall constitute knowledge or use in India of the invention on the date of the importation."

Here we would like to point out that small quantities may be imported to carry out experiments and tests in this country and that should not be treated as knowledge having come into this country. So this should not affect a product thus imported for the purpose of tests or experiments only. Except for this small amendment or restriction, this Clause is perfectly alright.

Regarding Clause 82, the definition of "process" is not very clear. I submit that it is necessary that the word "process" be defined in this Clause so

as to restrict the patentee from registering all permutations and combinations or processes which were not experimented by him in his own laboratory; otherwise, he will cover the entire gamut of activity and make it impossible for any other person to carry on research. This is a case where we can very well define the process and limit it only to those processes which have been experimented upon by the patentee.

I now come to Clause 83. This lays down general principles, with which we are in full agreement. We very much welcome this Clause.

Similarly, Clause 84 is something which we want and which we welcome.

Clause 85 is regarding granting of compulsory licence. Here we submit that there is a possibility of cartelisation; all these people might come together and form themselves into a cartel and might particularly keep the prices up. So, while the matter is being gone into by the Controller, he should also see to it that there is no possibility of cartelisation. It is very difficult to know at the time when the application is made whether the people will form themselves into a cartel or not. But even so, probably some clause can be introduced which will make it impossible to form a cartel subsequently and the licence may be revoked in case it is found that cartelisation has been done.

Mr. Chairman: That is more in the province of Company Law.

Shri R. Ramanathan Chettiar: In other words, we do not want monopolies.

Shri Hansraj Gupta: Yes. The Controller should be in a position to take some steps. You can provide some clause for it in the Bill.

Mr. Chairman: That may be one of the reasons for revocation?

Shri Hansraj Gupta: Yes.

In respect of "licences of right", there is a little distinction which we have made in Clauses 86 and 87. For some of the products, the licences of right can be given after three years, but in the case of drugs and pharmaceuticals the licences of right will be granted as soon as the patent has been sealed. We submit that, in this case, the patentee does not get a full opportunity to exploit his patent. Therefore, so far as drugs and pharmaceuticals are concerned, a period of three years should be given as in the case of the other products.

Mr. Chairman: What is the time that you suggest?

Shri Hansraj Gupta: Three years, just as in Clause 86. Once you agree to that, necessary changes may have to be effected in various other clauses also. Drugs and pharmaceuticals also fall in the same line and three years' time should be given to the patentee here also; afterwards, it may be endorsed with "licences of right".

Shri R. Ramanathan Chettiar: So you agree with the period of three years.

Shri Hansraj Gupta: Yes.

In respect of Clause 88, you have suggested that the royalty should not exceed 4 per cent. On going through one of the memoranda given by the UPIA, I find that the average royalty which they have worked out is only 3.1 per cent. If that is so, we may put the royalty even as 3 per cent and I would not mind that. Of course, I agree to 4 per cent.

Shri R. Ramanathan Chettiar: That is the maximum.

Shri Hansraj Gupta: Yes; we quite agree to that.

Clause 90 spells out in detail the circumstances in which reasonable requirements of the public shall be deemed not to have been satisfied. We submit that, if the working of a patent in India is to be looked upon

as an essential obligation on the part of the patentee, the very fact that the patentee has not cared to manufacture in India the patented article should be sufficient to conclude that reasonable requirements of the public are not satisfied. Therefore, we suggest that the Clause be amended to read as follows:—

"If the patentee has not manufactured in India to an adequate extent and supply on reasonable terms for any justifiable reasons, the patented articles or a part of the patented articles which is necessary for its efficient working or if, by reason of the refusal of the patentee to grant a licence or licences on reasonable terms . . ."

So far as Clause 92 is concerned, it is quite allright. But at the same time we submit that the rules which have been formed under the old law are defective and new rules should be framed as early as possible and care should be taken that those defects do not come in.

Clause 93 spells out the power of the Controller in granting compulsory licences. In the original Act, the appeal was to the High Court of Calcutta. The appeal to the Central Government is likely to be governed by non-judicial considerations. We, therefore, submit that an independent tribunal may be appointed specifically for this purpose.

Shri R. Ramanathan Chettiar: Do you want an appeal to the Central Government or to a judicial court?

Shri Hansraj Gupta: We want the appeal to go to a judicial court. But, a special Tribunal might be appointed.

Shri R. Ramanathan Chettiar: You want the powers to be vested in the Central Government.

Shri Hansraj Gupta: Yes, Sir. We very much welcome clause 96. Similarly, we welcome clauses 97 and 98 too. In the case of clause 99, powers are given to the Central Government to use a patent or invention for the purposes of Government. We suggest that the Government should not be given such unrestricted powers to use the patent without due processes of law.

Shri R. Ramanathan Chettiar: In case of emergency?

Shri Hansraj Gupta: In case of emergency such as for defence, we have no objection to such powers being used by Government. We want, however, that the patentee must be given some protection.

Mr. Chairman: What is the protection that you want to be given to the patentee in such cases?

Shri Hansraj Gupta: We do not want any protection to be given in the case of emergency. In case of emergency, this clause is all right. In such cases, the usual processes of law might be followed. In other cases, you might give 4 per cent as royalty.

Mr. Chairman: In other words, do you want that some compensation should be given?

Shri Hansraj Gupta: The normal compensation which you have already provided for in the Bill might be given. The Controller should decide as to what compensation should be given.

In the case of defence, we don't mind. So far as compensation is concerned, it might be paid according to realisations that you have laid down already. But, this should not exceed 4 per cent.

Shri R. Ramanathan Chettiar: This 4 per cent is about royalty.

Mr. Chairman: Let him finish what he wants to say. You may then put questions to him.

Shri Hansraj Gupta: I am talking about the compensation to be given to

a patentee in case the Government is compulsorily using their patent. This might be decided upon by the Controller. It is possible that it might even be lower than 4 per cent. That should be done as per the regulations provided for here. The only point that we want to submit is that such a complete expropriation is not called for.

Dr. Gurbax Singh: I have nothing more to add.

Shri G. M. Parikh: I would like to add only one thing. As I have mentioned to the Study Group in Bombay, this Bill may kindly be passed as early as possible, before it lapses.

Mr. Chairman: We are all equally anxious.

Shri G. M. Parikh: That is the only point that I go on repeating.

Dr. C. B. Singh: You are representing three very important sections of the Industry. May I know whether any of these groups which you represent have put in their patents anywhere as far as drugs are concerned?

Dr. Gurbax Singh: Unfortunately, we have not put in any patents anywhere. But certainly our products have brought down the prices very much.

Dr. C. B. Singh: That is a different question. Have you put any of your product with any patent?

Dr. Gurbax Singh: Not by ourselves.

Dr. C. B. Singh: The second question is this. What is the amount of money that you go on spending on research putting all of you together? We want a reply for this since you are representing three groups.

Shri G. M. Parikh: Every body is doing the research in his own way. Here the question is about the availability of raw materials like intermediaries and solvents for doing the research. For example, for research, certain instruments are necessary. But, because of the import restrictions and foreign exchange difficulties, it could not be done.

Another thing is that since 1962 there is not enough scope for making any products because of ceiling of prices so that the industry can plough back its money for research. Another important thing is that if the Bill is amended and if the process is worked out, scope will be given to the Indian technologists to do the basic research. Unless and until something is done in this regard, the things which are already existing with the Indian industries cannot take them up. Even if the process of any drug is worked out, it is doubtful whether they would be able to exploit that.

Dr. C. B. Singh: You are not sure that you will be allowed to exploit the patent.

Shri G. M. Parikh: I would cite as an example Sulphadiozine and Talbutomide tablets. The State Government could not exploit the process and develop them still further as they were covered under patent laws. More than about 123 processes of Talbutomide have been registered under the present Patent Act. If anybody works out any process, he cannot come in because the process is already sealed under the Patent Act. Therefore, we have suggested in our memorandum that unless and until the process that has been worked out in the laboratory is developed further and put in the market as a product, it would be difficult to take advantage of by the people.

Dr. C. B. Singh: You are talking about a case which has been going on and which has not been decided. I am not concerned with that. I know that there are two famous cases; we are not concerned with that. My point is this. How much money you have been spending on research so far? I hope you will agree that only by research of many types of new phar-

maceutical drugs that you can develop new drugs and put them in the market. You have not given your answer as to how much money has been spent on research in this regard.

Dr. Gurbax Singh: The question of research to such an extent in the case of pharmaceutical industries will, I am afraid, take about ten years from now and not just now. I am making this statement because it is only since 1957 or so that these series of manufacturers of drugs have come up in this country. Prior to that, it all depended on imported drugs only. Unfortunately, all these years, everyone was preferring the medicines manufactured abroad. It is only since 1957 we have been manufacturing the drugs here. Whatever products that we have put in, the manufacturers alone can tell you as to how much money has been spent for propagating their trade marks and their drugs as compared to the foreign ones.

Coming to research, I must say that to-day Indian financiers or capitalists seem to be anxious about immediate profits rather than awaiting for profits. This is an unfortunate mentality. I am afraid that the manufacturers are hardly in a position to think of research at the moment to a large extent as in other countries. So, if I say that about Rs. 50,000 has been spent by my company alone, it is nothing as compared to crores of rupees that have been spent on research by foreigners. Foreign companies are more than a century old whereas we took up manufacturing of drugs only a few years ago. Prior to 1956, some of the people were dependent on the imported drugs. Some of the manufacturers have put up research laboratories here. So I would respectfully say to Dr. C. B. Singh that research work will be done only after some time, not just now.

Dr. C. B. Singh: It is so not only in the pharmaceutical field—because you have not put in the money there at all; you have only been getting the formula and propagating the drug. But even in the national laboratories—that is the most unfortunate part of it—hardly anything has been done. That is what I am trying to put before you. What will you suggest so that this important activity of forming, formulating and finding out newer drugs by a particular process or by patented methods can be promoted? Could you suggest how this process can be helped because it is in our interests and it is in the national interest?

Dr. Gurbax Singh: I am extremely grateful to you for putting this suggestion before the Committee. I do feel that the Indian pharmaceutical industry badly needs that aspect of research. To my mind some good research work is being carried on in our national laboratories. But so far as the pharmaceutical manufacturers are concerned, I need hardly tell you that to-day the investor wants a return and dividend every year rather than thinking of research. The pharmaceutical industry in India is very much in its infancy. Of course there are people who have been in the field for 50 years or so, but they have not done anything at all in the field of research. They have been getting foreign research.

Dr. C. B. Singh: A lot of talk has been going on about the process and product patents; whether the process alone is to be patented or the product alone to be patented or process-cum-product to be patented. Our Bill provides for process alone. We have three alternatives. What will you suggest the best thing in the interests of our country?

Shri Hansraj Gupta: We have been suggesting that the processes which have been experimented upon by the patentee should be patended. Neither the product nor any other process through which he has not experimented himself should be patented.

Dr. C. B. Singh: That means the product by that process is not protected.

Shri Hansraj Gupta: Only the processes which he has experimented himself to be patented. Any other person can certainly manufacture that product through other processes. Then the patent is not going to militate against him. If he is using the same process which the patentee has patented, then of course he is barred. Otherwise, if the process is entirely different, he can certainly manufacture that product.

Dr. C. B. Singh: Evidence has come before us that Chemistry has advanced so far and is advancing so much that the difference in processes is almost thinning out day by day. The processes are more or less stereotyped and through these various processes you can by adding a molecule here or a molecule there bring out various products. In view of that will you lay stress entirely on process alone or will you combine the process and the product?

Shri Hansraj Gupta: In our opinion it should be only process.

Shri M. L. Jadhav: In the Bill a 10-year period is provided for certain products and a 14 year for certain other products. Would you like to have a 10 year term for all and secondly should it be from the date of application or from the date of sealing?

Dr. Gurbax Singh: It should be from the date of sealing.

Shri M. L. Jadhav: Will you think that when you say that our pharmaceutical industry have spent very little on research and if 10 years is the period, then in that case it is likely that India may be deprived of some good medicines because of non-availability of foreign interventions?

Dr. Gurbax Singh: In view of the present anti-biotics and other products which are already in the market, I have very little doubt if India will be starved of products of pharmaceutical line in case the 10 year period is kept.

Shri K. K. Warior: You said that you would like to have this ten year period retained. I wish to know whether after the 10 years or at the expiry of 10 years if a new process is added to the original patent, you would require some more extension of the period?

Shri Hansraj Gupta: We do not want, but if a case is made out and the Controller is satisfied that a little more time should be given, then another 4 years may be given and that is the limit.

Shri K. K. Warior: In the pharmaceutical field we are told that about 90 per cent of the original patents have expired already and the Indian manufacturers are exploiting those now. How does this Patent Bill affect the remaining 10 per cent? What are the repercussions that will be on the remaining 10 per cent when the 90 per cent is left to you for exploitation?

Dr. Gurbax Singh: If I am not mistaken only the balance 10 per cent came as the latest products and it is the right time that we should be given an opportunity to use this 10 per cent.

Shri K. K. Warior: Unless and until our pharmaceutical industry can come of age should we not give some margin for these medicines or drugs to come here so that at least from the people's or consumer's point of view it will be advantageous.

Dr. Gurbax Singh: I will be grateful if some specific questions are out because it is a very general question. If you kindly ask about any particular product, I can answer.

Shri K. K. Warior: In the present stage of the pharmaceutical industry abroad they have more facilities; they have more equipment and all the intermediates and basic materials. All these advantages are there and if they come forward with life-saving drugs and if their products are patented here, do you want to exclude the Indian consumer and the Indian public from using that simply for keeping those products away by patent restrictions here?

Dr. Gurbax Singh: I am sorry I cannot answer this question as it is very vague. If you kindly specify any product, I will be able to give a definite answer. What are those products which you are aiming at? Our entire medical profession to-day is dependent upon a very few range of products—anti-biotics so many, then vitamins mean so many. I am afraid with the exception of....

Shri K. K. Warior: We cannot say that. Inventions come all of a sudden. But the position is that the circumstances are such that they are in a better position and keeping in view the present stage of our industry, do you want to exclude the Indian consumer from the advantage of any new drug coming from outside which is a new invention?

Dr. Gurbax Singh: I may bring to the notice of my hon'ble friend that the import of many of the medicines is already banned. We are not permitted to import any medicine unless under very special circumstances and that too will be allowed only by the Drugs Controller. So far as drugs are concerned which will use that formulation practically everything which is not being manufactured basically in India is allowed to be imported and there is no question that it will harm public interest if the new patent is given.

Shri K. K. Warior: How is it that the Indian prices of locally manufactured substances are much higher than the foreign prices, even taking into account the present circumstances of our development?

Dr. Gurbax Singh: Well, Sir, I am very glad that you have put this question. In fact I have myself pointed out that the pharmaceuticals or the basic materials that are being produced in India are much more costly than those produced by foreigners. I would say in this respect that again the patents are coming in our way. Now let us take chloramphenicol, a general name for Chloromycetin. I am one of the pioneers in this field. In 1947-48 when originally Chloromycetin came into this country, 12 capsules to a patient would cost Rs. 65. Now the Italians don't have any trouble with patent law and they were selling at Rs. 28 for 12 capsules. The price in India was brought down from Rs. 65 to Rs. 35 in 1952; the American company was fined Rs. 9 lakhs when the first consignment came from a competitive firm in Italy. Later on, they went on reducing the price and now the price is Rs. 7.20 for wholesale and Rs. 9 for retail, whereas my company is today selling it at Rs. 3.75. The Government of India has granted import licence for the import of Gurcomycetin (Chloramphical) from America. The American price now for it is $85 (about Rs. 640) for one kilogram whereas the same manufactured in Bombay costs Rs. 410 per kilo. But if it is imported from Italy, it will cost only Rs. 180 per kilo. So again the patent law comes in the way.

Shri K. K. Warior: If I suggest that for the time being, let us not have any patent at all for the pharmaceuticals, what is your reaction?

Dr. Gurbax Singh: Well, I don't mind. That is what happened in Italy.

Shri A. T. Sarma: In your statement, you have stated that "the majority of the foreigners who have taken out patents in India never intended to manufacture their patented medicines in our country. These patents have been registered in this country to prevent Indian manufacturers from going into the production of these products." What remedy do you suggest for this?

Dr. Gurbax Singh: The new Act is the remedy. I might say for your information that the company which is

now offering chloramphenicol at $ 85 took out a licence from the Government of India for its manufacture some 10 years ago. But even to-day they are not basically manufacturing the whole product here. If there are 19 processes for its manufacture, they start here from the 16th process or something like that.

Shri A. T. Sarma: It is said that India is lacking in technological development and technicians and that if this Bill is passed, India may lose the assistance of foreign technology and technicians. Do you agree with that?

Dr. Gurbax Singh: I am afraid I can't agree with this. I have already stated that it will not affect our economy or health if the new Patent law comes into being and if some of the manufacturers, who are actually foreign manufacturers, come here and say otherwise, it is only for profiteering at the cost of the poor patient and nothing else.

Shri A. T. Sarma: We won't have any difficulty?

Dr. Gurbax Singh: Absolutely no difficulty.

Shri A. T. Sarma: India will be able to run its own industry without the assistance of the foreigners?

Dr. Gurbax Singh: Yes, but with the exception of those basic raw materials for which you have already permission to import. Majority of the manufacturers are already depending on the indigenous raw materials now. The import is only about 12 to 15 per cent of the raw materials.

Shri G. M. Parikh: Regarding technology and technical staff, on page 3 of the supplementary memorandum, they have stated that "the technology employed in research and the manufacturing processes are at present of the same high standards as applied in advanced countries like U.K., U.S.A. and Japan." Now the only thing is that our technological staff should be given an opportunity to work so that when they get the facility to work, they will create among themselves a pool of workers in research and they will get research-minded. At present, they are only concerned with manufacturing and testing. To create research-mindedness in the technical staff requires certain training, and if they are to work on processes the industry must be sure that they are in a position to exploit whatever they produce in the laboratories. So the provisions regarding the licence of right and compulsory licensing will give sufficient opportunity to the technological staff to develop the processes and work and prepare themselves for basic research at a later date.

Shri A. T. Sarma: Some foreign witnesses stated that if the present Bill is passed, India's industrial activities will move backwards. Do you agree with it?

Dr. Gurbax Singh: No, we don't agree with it. In West Germany and Japan also, provisions for compulsory licences and licence of right are provided.

Shri Kashi Ram Gupta: Licence of right is not provided.

Shri A. T. Sarma: Do you carry any research work on Indian plants and if so, have you found any good results?

Dr. Gurbax Singh: I might only say that the foreigners have come and exploited our country, its plants and the scientific workers. We have not done it ourselves.

Shri R. P. Sinha: I would like to know if the hon'ble witness thinks that the research work has basic im-

portance for the development of technology and pharmaceutical production in this country or not. Do you attach importance to basic research?

Dr. Gurbax Singh: Yes, Sir. We do.

Shri R. P. Sinha: What should be done in order that we may develop basic research? What is your suggestion?

Dr. Gurbax Singh: I do not think, Sir, this is proper forum for me to say. Some Government help should be forthcoming for this.

Shri R. P. Sinha: Do you think that Government help alone will deliver the results?

Dr. Gurbax Singh: No. Government combined with private enterprise.

Shri R. P. Sinha: You have just stated that no worthwhile research is being done by the industry. It is a known fact also. Now you say you are not in a position to invest large amount of money in research work. Could you give us an idea what amount of money is required for carrying on basic research?

Dr. Gurbax Singh: I am afraid, we do not have any particular exprience of that.

Shri R. P. Sinha: You have stated yourself that basic research is important. I agree with you. Now what should we do in order that we may encourage basic research. You have said let there be only copying work for the next 10 years. How do you reconcile these two statements of yours?

Dr. Gurbax Singh: Talking about this, Sir, even abroad—specifically the American people who are known to be on the top in the research work today in the pharmaceutical side—even in America, if you go into the details of their research method, you will find, one or two companies do the research and they sell out their research to the other small manufacturers.

Shri R. P. Sinha: That we know. I am merely interested in asking have you applied your mind to this particular problem of developing basic research in this country?

Dr. Gurbax Singh: Yes, Sir. We have.

Shri R. P. Sinha: What is your suggestion? How could this Committee help the progress of this basic research in this country?

Mr. Chairman: I think he has already given the answer—Government help combined with private enterprise.

Dr. Gurbax Singh: Our major problem is that today investor needs a return immediately. We represent the investors. We have to look to their interests to begin with. What we feel is we must try to bring in products of foreign companies which are popular. Sir, I am making a clear statement. What happens to those products. They are again being copied by the international market—not by Indians only. This is the position in the world today.

Shri R. P. Sinha: Granting that, we would like to put you in such a position that you may make investment on research. For example, take the Jhandu Works. They are manufacturing all kinds of Ayurvedic and Unani medicines, but they are all the time copying the age old pharmacopoeia. We would like that some basic research should be carried out by the Jhandu Works. What should we do in order that you may find money to make investment on research work?

Shri G. M. Parikh: I would cite one example of Canada. The Government itself supplements the research programme in the private industry and whatever is spent by the industry, 50 per cent of that is given by the Canadian Government by way of grant *plus* on the balance of 50 per cent, the company gets rebate in income tax. At the same time on

रिसर्च इतनी हो जायगी, कि हम खुद अपने पांवों पर खड़े हो सकेंगे ।

श्री विमलकुमार म० चौरड़िया : आपने जो मेमोरेण्डम दिया है उसमें आपने सब बातों से सहमति प्रकट की है, लेकिन जहां तक कम्पलसरी लाइसेन्स का ताल्लुक है, उसके लिए कन्ट्रोलर ऐसी कौनसी बात अपने दिमाग में रखना चाहते हैं, जिनके लिये कम्पलसरी लाइसेन्स दिया जाय ।

डा० गुरबक्श सिंह : यह तजुंबे की चीज़ है, जैस जैसे तजुर्बा होता जायगा, रूल्ज़ में अमेण्डमेंन्ट होती रहेगी । इस वक्त पेटेंन्ट ला पर बहस हो रही है, इस के बाद जिन जिन तबदीलियों की जरूरत होगी. वह इस में होती जायगी । इस वक्त तो इसका ऐसे ही बनने दिया जाय, रूल्ज़ बाद में बनाये जा सकते हैं ।

श्री विमलकुमार म० चौरड़िया : क्या विदेशी लोग अपने माल की ज्यादा कीमतें लगाकर मार्केट को एक्सप्लायेट करते हैं, इसको रोकने के लिए ऐसी कोई व्यवस्था की जाय जिससे इन्टरनेशनल मार्केट में उनकी प्राइसेज़ को कन्ट्रोल किया जा सके उनके एक्सप्लायटेशन को रोका जा सके और उनके द्वारा जो खोज की जा रही है उसको सही दामों पर उपलब्ध कराया जा सके ?

डा० गुरबक्श सिंह : मुझे इस बारे में जापान का जाती तजुर्बा है । 1914 से 1921 की पहली लड़ाई में दवाइयां जापान जर्मनी से इम्पोर्ट करता था । इस लड़ाई के दौरान उनकी रिसर्च भी नहीं बढ़ी थी, सिर्फ कापींग चल रहा था, जैसा कि आज कल हम लोग कर रहे हैं । उसके बाद उन्होने एक आर्डर निकाल दिया कि अस्पतालों में वे दवायें सिर्फ जापान की बनी हुई ही इस्तेमाल होंगी, दूसरी दवायें इस्तेमाल न करें । इस वक्त हिन्दुस्तान में 16 हजार अस्पताल हैं अगर इनके लिये भी इस तरह से फैसला हो जाय कि जो खास दवायें हिन्दुस्तान में बनती हैं, जिनके बनाने में हिन्दुस्तानी कैपिटल लगा है, हिन्दुस्तानी वर्कर्स हों, हिन्दुस्तानी मिल्कियत हो, उनकी दवाओं को अगर आप मौका दें, 100 फी सदी न सही, 75 फी सदी दें, तो रिसर्च तो हम आटोमेटिकली शुरु कर देंगे ।

इस वक्त क्या हो रहा है, मैं आपको एक मिसाल देता हूं । क्लोरोमाईसिटीन को ले लीजिये । इसको ओरिजनली पार्क डेविस ने बनाया । उनके दाम इस दवा के 1000 गोलियों के 700 रुपये हैं, जब कि हम लोग यही दवा 110 रु० में देते रहे हैं । जब उन्होने देखा कि हम इतने कम दाम में दे रहे हैं तो उन्होने क्या किया कि सरकारी अस्पतालों में इसके दाम 110रु० कर दिये, लेकिन आम पब्लिक के अस्पतालों के लिये वही दाम रखे । अब आप अन्दाजा लगाइये कि 700रु० और 110रु० में कितना फर्क है जबकि माल में कोई फर्क नहीं है और फर्क हो भी नहीं सकता क्योंकि ड्रग एक्ट इतना स्ट्रिक्ट है कि उसमें सब-स्टैण्डर्ड का सवाल ही पैदा नही होता । हिन्दुस्तान की फार्मास्यूटिकल कम्पनियों ने इस बात की कोशिश की है, कि उन दवाओं को कम से कम दाम पर यहां की जनता को दे सके । पिछले 6-7 सालों में इस तरफ काफी काम हुआ है ।

Shri R. Ramanathan Chettiar: In their Memorandum they liked to know from the Controller the reasons why the patent was rejected. That is under clause 127.

Dr. Gurbux Singh: The point, Sir, is very small. The intention is that in this democratic country we should not give powers to just a single man.

Shri R. Ramanathan Chettiar: From the time you file an application, with

the Controller till the time the Controller takes a decision on your application, there will be a time-lag, and then naturally you will know the reasons which impelled the Controller to come to a conclusion? Is it necessary for the Controller to give you the reasons?

Dr. Gurbax Singh: In order to avoid complications at a later stage and get the blame for one thing or the other, there is no harm if the Controller gives something in writing to the applicant.

Shri R. Ramanathan Chettiar: Do you envisage the possibility that in your judgment the Controller may err in which case you would like to go in appeal?

Dr. Gurbax Singh: That is exactly what we mean by this. It is better that the Controller himself may give the reasons first so that lot of time can be cut short in the subsequent stages.

Shri R. Ramanathan Chettiar: In the normal process your viewpoint can always be put before the Controller and he can review the position himself.

Dr. Gurbax Singh: That is exactly what we have meant by this. Instead of rejecting straightway, let him give the reasons so that an opportunity is given to him to explain his conduct. He can have in his file the fact that the reasons were sent to the applicant.

Shri R. Ramanathan Chettiar: From the replies you have given to my honourable colleagues I find that you are representing the distributing trade.

Dr. Gurbax Singh: No. We are all manufacturers. I am the President of Gurco Pharma Private Ltd.

Shri R. Ramanathan Chettiar: I think your colleague Mr. Hansraj Gupta was confusing the question of royalty with the question of payment of compensation. You would expect compensation from Government if they take up manufacture in an emergency. Royalty is different from compensation. Compensation is not provided even in the present Bill.

Shri Hansraj Gupta: We want that this man should be able to get some compensation. We thought that the royalty was sufficient compensation...

Shri R. Ramanathan Chettiar: Only in percentage.

Shri Hansraj Gupta: Yes.

Shri R. Ramanathan Chettiar: Compensation should be the royalty percentage. Otherwise compensation is not provided in the Bill.

Shri B. K. Das: You have suggested that there should be definition of the term 'process' so that there might be one process for a single product. I think if you accept the dictionary meaning of the term, then probably you need not have any definition for that. Are you agreeable to this?

Dr. Gurbax Sing: Actually 'process' should be defined clearly in the Act so that there is no confusion about it.

Shri B. K. Das: Suppose it is mentioned in the Bill that you want one process only to be patented....

Shri Hansraj Gupta: One or more processes provided all of them are experimented upon by the patentee. If it is not experimented, then under the definition that process will not be covered.

Shri B. S. Giri: What we mean is this: A process which has been carried out in his laboratory by the applicant. We want that sort of definition.

Shri B. K. Das: He will say that he has been successful in producing a certain drug and he wants patent for all the processes. It may be that he will exploit only one process.

Shri B. S. Giri: For example, in Chemistry we have so many processes before you arrive at the final product. For instance, nitration will be done by various means. Mixing is a process. What we mean by process is something which he has carried out in his laboratory. If he has experimented with two processes, let him have two. If he has experimented with three, let him have three; but not processes which he has not experimented.

Shri K. K. Warior: Is there any method to find out that he has experimented it in his laboratory?

Dr. Gurbax Singh: We have a complete protocol for that in every laboratory. The Controller can examine that. Ultimately there is no objection to accept the dictionary meaning.

Mr, Chairman: When a particular phrase has no definition, the practice is to accept the dictionary meaning.

Shri B. K. Das: Then you wanted clause 87 to be deleted. But you should know that this is one of the important clauses in our Bill. This Bill has tried to put drugs, medicines and food on a different footing so that our people in India will have better advantage of exploiting them. If only clause 86 is there, do you think that all the safeguards provided in 87 will be available to them? Will they not be prevented from expoiting them?

Shri Hansraj Gupta: There was discussion on this very point in our organisation. A number of people were of your opinion. But the general concensus was that the patentee should be given three years as in the case of other articles. It is quite correct that there was a difference of opinion in our organisation on this point.

Shri Shyamnandan Mishra: I have two problems in my mind. One is that if the patent manufacturers deliberately keep the manufacture at a low level and because the economy of the scale is not available the prices of such products are kept artificially very high, what remedy would you suggest? Would you suggest that it must be binding upon the patent manufacturers to keep to a particular scale of operation, that is the optimum level?

Shri Hansraj Gupta: We thought that the Controller will go into that matter whether he has been carrying on manufacture according to the public requirements.

Shri Shyamnandan Mishra: My question is simple economics. Economy of the scale should be available to him if the product is to be cheap. If a particular manufacturer deliberately keeps the scale very low and therefore artificially keeps up the price very high, should it not be laid down in the beginning that he must conform to a particular minimum?

Shri Hansraj Gupta: After all the drugs may be manufactured. But to that extent they may not be used by the public. In case you compel him to manufacture, he may manufacture; but he cannot sell them. Therefore, these two things have got to be adjusted. A little time may be given to him. If the demand is there, and still if he is producing at a low level, the Controller can take action against him.

Shri Shyamnandan Mishra: Should there be a provision in law that there should be a minimal requirement of scale of manufacture on the basis of known demand?

Shri G. M. Parikh: There is sufficient provision already. If the manufacturer is not meeting the country's requirement, the Controller can revoke the licence and give it to other people. Or, Government themselves can take up the manufacture.

Shri Shyamnandan Mishra: There is a certain nuance of difference I am

trying to make. It may well nigh be impossible for a particular manufacturer to meet the demands of the community entirely. But should it not be insisted upon that a particular unit conforms to the minimal requirement?

Shri Hansraj Gupta: Where the demand is already there he must be asked to put up an economic unit. We can make a suitable amendment to that effect.

Shri Kashi Ram Gupta: How is it possible to assess the demand when the patent is granted?

Mr. Chairman: How can you lay down that condition when the patent is granted? It is not practicable.

Shri Shyamnandan Mishra: If the actual known demand of the community is X and if the production on the basis of the patent is going to be X—Y, should it not be laid down clearly that the remaining unfulfilled demand could be met by import?

Shri Hansraj Gupta: Apparently there is nothing against it. I only suggest that in the first instance, the quantity Y should be allowed to be manufactured here itself by means of a compulsory licence or licence of right.

Sardar Daljit Singh: In your memorandum you have said that the majority of foreigners who have taken out patents did not manufacture their patented products in this country. What is the number of such patents registered in India?

Dr. Gurbax Singh: It may not be possible to give the exact number. But I can give some examples. The total requirements of the country of chlorophenecol according to Government publications is 50 tons per year. The licensed capacity already is more than 52 tons, but the manufacture is hardly 10 tons, that too not at the basic stage, but from the intermediate stage. Other examples are tetracycline, hydrochloride, vitamin C, etc.

Shri Kashi Ram Gupta: Other than pharmaceuticals, what other industries are represented by you, which hold patents?

Shri Hansraj Gupta: Radio, textiles transistors, etc. There are several industries.

Shri Kashi Ram Gupta: You say that the period of patents may be reduced to 10 years in all cases. Is it the view of the manufacturers as a whole?

Shri Hansraj Gupta: Yes.

Shri Kashi Ram Gupta: But not a single manufacturer has given evidence before us like that. This is the first time I hear it.

Shri Hansraj Gupta: When we are asking for 10 years, we are taking into account the interests of other industries and the interest of the consumers also.

Mr. Chairman: Are other industries represented in your organisation? Have you taken their view also into consideration?

Shri Hansraj Gupta: Yes. We considered it in our committee. Most of the other manufacturers also are represented there.

Shri Kashi Ram Gupta: Do you know that FICCI and CSIR have got different views on this? They want to stick to 16 years, for items other than drugs.

Shri Hansraj Gupta: If the Controller is satisfied that 10 years are not sufficient, then 14 years may be given. We do not mind it.

Shri Kashi Ram Gupta: That means 4 years will be the renewal period.

Mr. Chairman: They do not mind if it is 14 years for other industries.

Shri Kashi Ram Gupta: I have stated the opinion of CSIR and other technical people.

Shri Hansraj Gupta: We do not know about that.

Shri Kashi Ram Gupta: Dr. Gurbax Singh said that we may be able to take to research in ten years. May I know his idea about a unit of pharmaceutical industry which can have a research wing of its own?

Dr. Gurbax Singh: I can talk about my own firm which has its office in Delhi to which a visit from the hon. Members of this Committee is always welcome. We have about eight specialists who are working only on research. We are spending about Rs. 50,000 a year at present. We have 4 M. pharm., 3 B. pharm and one B.Sc. who are placed under the charge of one medical man working only on research. While we are developing new products we are trying to deviate from the conventional products that are coming from foreign countries. I must make a statement that it is very uneconomical. The moment we go to the medical profession, they say that they want time before they change over from the previous conventional products. Therefore, our own research people say that they will take over new products a little later and they will continue to manufacture the conventional products. That is the state of affairs with a majority of manufacturers. As I said, I would welcome a visit from the Members to our firm. We are doing research on vitamins and also on herbs. We have not finalised anything excepting those conventional products which we are doing. For instance, combination of anti-biotics was in a very very ambiguous state and the foreign companies were telling that it was impossible for any Indian company to do that. Fortunately, my firm has been the first to do it and do it successfully. Chloremphenicol was never available from any corner in a ready-made injection form. It was available either in a powder form to be mixed with water or in some other way. My company was the first to produce it in an injectible form and we have been using it since 1955.

Shri Kashi Ram Gupta: You are doing research on products and not basic research?

Dr. Gurbax Singh: We are doing product research.

Shri Kashi Ram Gupta: What would be the minimum requirement of a unit doing basic research? What will be the yearly expenditure?

Dr. Gurbax Singh: About Rs. 4 lakhs to Rs. 5 lakhs a year and in about five or six years they can be very successful.

Shri Kashi Ram Gupta: CIBA has a research institute in Bombay. They say they are spending Rs. 50 lakhs a year, they have 25 senior scientists and so on. Are you of the opinion that such a large research unit is required?

Dr. Gurbax Singh: I do not think so. It is very difficult to criticise anybody. I would request this committee to go into the details of their expenditure and then they will see the real position. It may be that to avoid income-tax they show huge expenditure under this head.

Shri Kashi Ram Gupta: There are experts who have said that it takes several years to finalise the clinical research. Are you of the same opinion?

Dr. Gurbax Singh: No. I can say that when we started manufacturing the basic injectible product of Chloremphenicol we first gave it to Safdarjung Hospital and, I remember, they took six months to give a confirmative report and after that we issued the product. Unless hospitals refuse to cooperate with the manufacturers, it should not take more than a year or two.

Shri Kashi Ram Gupta: Are clinical facilities the same here as in the European countries?

Dr. Gurbax Singh: Our doctors are reluctant to try new products on their patients. Therefore, what we do is, we try the medicines first on animals, which takes about six months, and then we give them to the hospitals who take another six months.

Shri Kashi Ram Gupta: You have said that you require a period of ten years. Is it from the date of sealing of the patent?

Dr. Gurbax Singh: Yes.

Shri Kashi Ram Gupta: There are also a number of model laws for developing countries. They also say that ten years is the minimum period. But seeing to the conditions of our country, do you think a ten year period is sufficient?

Dr. Gurbax Singh: Ten years would be the maximum.

Shri Kashi Ram Gupta: It means if this Bill is passed we will be able to have easy access to compulsory licensing?

Dr. Gurbax Singh: I should think so.

Shri Kashi Ram Gupta: Then we will be able to force foreign patentees to either start manufacturing in this country very soon or give compulsory licence.

Dr. Gurbax Singh: Yes.

Shri Kashi Ram Gupta: What about our local people, Indian firms who want to have research? Will this period be enough?

Dr. Gurbax Singh: Yes.

Shri Kashi Ram Gupta: In your memorandum you have said nothing about clause 66.

Dr. Gurbax Singh: That means we agree with it fully.

Shri Kashi Ram Gupta: Can you give some statistical data to elaborate this point to show that it is not correct that if this Bill is passed it will discourage foreign investment in this country?

Dr. Gurbax Singh: Here we are discussing the pros and cons for the betterment of our own community and not how much benefit should be given to the foreign manufacturers. On the contrary, I would be the first man to say that even if we stop foreign manufacturers nobody in this country will die for want of medicines. I can supply the required statistics if necessary. So far as price structure is concerned, besides help, we have to see how many people in the ountry are dying without medicines because they cannot afford them. Looking into that, at least our motto is to produce products at the minimum possible price so that the poor patients can obtain them. While that is our main motto as representatives of the industry here, the motto of the foreign manufacturers is quite different. We have got some statistics of prices which will prove that. For instance, TB is a bad disease in India and the price of one product manufactured locally is Rs. 30 whereas the price of the imported material is Rs. 12. This is due to the operation of the patent law. For another drug the local price is Rs. 31 while the imported price is Rs. 7. For a third drug the indigenous price is Rs. 90 while the imported price is Rs. 25. These are all unpatented drugs. You can see the difference. Once the new Patent law comes into force, the local prices are bound to come down.

Shri K. V. Venkatachalam: If, as you sya, these are all unpatented drugs, how will the prices be affected by the passing of the new patent law.

Shri G. M. Parikh: Our high prices are due to the cost of intermediates which have to be imported.

Shri Kashi Ram Gupta: Do you think that foreign collaboration is needed or not for the next ten years?

Dr. Gurbax Singh: It is a matter of opinion. Personally speaking, I have done it without foreign collaboration so far.

Shri Kashi Ram Gupta: I am asking for the country as a whole. Do you

think that we can do away with foreign collaboration immediately?

Dr. Gurbax Singh: A lot of fuss is made about it. Even the Finance Ministry would give permission only if we have foreign collaboration. There is a sort of mania for it in our country, including in the pharmaceutical industry.

Shri Kashi Ram Gupta: I want the opinion of your organisation.

Dr. Gurbax Singh: In Bengal 99 per cent of the companies are operating without foreign collaboration. In Bombay people are after foreign collaboration. In my own organisation, I have no foreign collaboration.

Shri Kashi Ram Gupta: What is the view of Shri Hansraj Gupta?

Shri Hansraj Gupta: We have always considered that foreign collaboration may be allowed to a certain extent. After all, we have nothing against foreign collaboration. It is a matter of convenience and judgment also. We must not put a ban on foreign collaboration on ideological grounds.

Shri R. P. Sinha: Would you like to have the inflow of foreign capital and foreign technical know-how or not?

Shri Hansraj Gupta: We would certainly welcome it.

Mr. Chairman: Thank you.

(The witnesses then withdrew).

(The Committee then adjourned)

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Tuesday, the 12th July, 1966 at 09.30 hours.

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Seth Achal Singh.
3. Shri P. C. Borooah.
4. Sardar Daljit Singh.
5. Shri Basanta Kumar Das.
6. Shri V. B. Gandhi.
7. Shri Kashi Ram Gupta.
8. Shri Madhavrao Laxmanrao Jadhav.
9. Shri Mathew Maniyangadan.
10. Shri Braj Behari Mehrotra.
11. Shri Bibudhendra Mishra.
12. Shri Chhotubhai M. Patel.
13. Shri Naval Prabhakar.
14. Shri R. Ramanathan Chettiar.
15. Shri A. T. Sarma.
16. Dr. C. B. Singh.
17. Shri K. K. Warior.
18. Shri Balkrishna Wasnik.

Rajya Sabha

19. Shri Arjun Arora.
20. Shri Vimalkumar M. Chordia.
21. Shri Shyamnandan Mishra.
22. Shri Dahyabhai V. Patel.
23. Shri Mulka Govinda Reddy.
24. Shri M. R. Shervani.
25. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*

3. Shri A. Joga Rao, *Controller General of Patents, Designs and Trade Marks.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMAN

Shri R. S. V. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Indian Chamber of Commerce, Calcutta.

Spokesmen:

1. Shri B. P. Khaitan.
2. Shri B. Kalyanasundaram.

II. Associated Chambers of Commerce and Industry of India, Calcutta.

Spokesmen:

1. Mr. C. A. Pitts.
2. Mr. A. B. Parakh.
3. Mr. I. Mackinnon.

III. Bengal Chemists and Druggists Association, Calcutta.

Spokesmen:

1. Shri P. K. Guha.
2. Shri T. K. Ghosh.

I. Indian Chamber of Commerce, Calcutta

Spokesmen:

1. Shri B. P. Khaitan:
2. Shri B. Kalyanasundaram:

(The witnesses were called in and they took their seats)

Mr. Chairman: The evidence you give is public and will be published and laid on the Table of the House. Even if you desire any part of it to be confidential, that also is liable to be distributed to Members of Parliament. We have received your memorandum which has been circulated to all the members. If you want to stress any particular point or add any new point, you may do so. Afterwards, members will ask questions.

Shri B. P. Khaitan: We are fully in agreement with the objects and purposes of the Bill. We would like to emphasise only one or two points. One is about the tenure of patents. The Bill provides that it shall be 10 years. You know after a patent has been registered it takes 4 or 5 years before any practical use can be made of it. So, having regard to the expenses and costs involved in working out a patent, setting up a factory, etc., 10 years is too short a period. So, we suggest that the tenure provided under the existing Act should not be reduced. We understand the question of tenure has been considered under the auspices of the UN and they have also recommended

a period of 20 years. This may be considered.

There is a provision for compulsory acquisition of patents by the Government, Government corporations or any person authorised by the Government, but the objects and purposes for which this compulsory acquisition will be made, like famine or defence, etc. have not been specified. This may alarm patent-holders and outsiders registering patents here. So, those objects and purposes should be laid down in the Bill itself.

Where royalty has not been agreed upon, the Bill provides a maximum royalty of 4 per cent. This may not be adequate. Therefore, the maximum limit should be raised.

Shri Kashi Ram Gupta: How many manufacturers of pharmaceutical drugs are members of your Chamber?

Shri B. P. Khaitan: About 50 to 60.

Shri Kashi Ram Gupta: The model law itself provides on page 49 in its commentary that a patent can be granted for a minimum period of 10 years from the date of grant of the patent. This is the commentary on section 25.

Shri B. P. Khaitan: We were informed that it is 20 years. We stand corrected.

Shri Kashi Ram Gupta: The main reason given for demanding a longer period for the pharmaceutical industry is that they have to spend on research. But in India, the industry is not spending anything on research. In view of this, is it not desirable in the interest of the consumers that the period should be minimum?

Shri B. P. Khaitan: If there is no research, there will be no patents. If there is research, there will be expenditure. If you do not give a longer period, the incentive for research will not be there.

Shri Kashi Ram Gupta: Is there any research undertaken in the Calcutta region?

Shri B. P. Khaitan: Attempts are being made. People are now thinking in terms of undertaking research. There is a change of outlook in the industry. That is a well-known fact.

Shri Kashi Ram Gupta: Can you name any research institute in Calcutta.

Shri B. P. Khaitan: Many institutions have been set up. But actual research in the proper sense of the term is not there.

Shri Kashi Ram Gupta: Your Chamber represents both the pharmaceutical manufacturers and also the other industries' manufacturers?

Shri B. P. Khaitan: Our Association is composite representing manufacturers, consumers, traders and industrialists.

Shri Kahi Ram Gupta: In view of that, may I know whether the manufacturers of other industries have also demanded any amendment to be made in this Bill so far as the period is concerned?

Shri B. P. Khaitan: Our Memorandum has been drafted by the committee which is representative of all interests.

Shri Kashi Ram Gupta: So, the 14 years period from the date of completion of specifications is agreeable to you. My point is this. The existing Act provides 16 years period from the date of application and this Bill provides 14 years period from the date of completion of specifications. So, that does not make much difference. Do you agree with it or not?

Shri B. P. Khaitan: We have mentioned in our Memorandum that the period of 16 years should not be reduced.

Shri Kashi Ram Gupta: The period of 14 years is from the date of completion of specifications. Normally, it takes 1 to 1½ years to complete specifications. The period of 16 years is from the date of application. There is not much difference between the two. I want to know whether you are agreeable to that aspect.

Shri B. P. Khaitan: It makes no difference in that case.

Shri K. K. Warior: I wish to know whether you have ascertained the views of the members of your Association representing pharmaceutical industry in particular separately.

Shri B. P. Khaitan: They are appearing separately before you. They have sent a separate memorandum.

Shri K. K. Warior: I want to know whether you have ascertained their views.

Shri B. P. Khaitan: We have not done it.

Shri K. K. Warior: May I know whether the Chamber is representing foreign interests also? Have you any foreign members?

Shri B. P. Khaitan: No.

Shri K. K. Warior: May I know whether in the view of the Chamber the foreign patents come in the way of development of the industries represented by the members of your Association?

Shri B. P. Khaitan: There have been so many collaborations with foreigners at high cost. That is purely with a view to acquiring their know-how including their patent rights.

Shri K. K. Warior: May I know whether there is any difference of opinion between the collaborating interests and the non-collaborating interests?

Shri B. P. Khaitan: There will always be bargaining between the collaborating interests and the non-collaborating interests.

Shri K. K. Warior: Which has the more predominant voice in your Chamber, the collaborating interest or the non-collaborating interest?

Shri B. P. Khaitan: Everybody wants to collaborate but all have not got the resources.

Shri K. K. Warior: That is not the point. I want to know whether the collaborating interests are more predominant than others, whether their voice is felt more than others.

Shri B. P. Khaitan: The voice of collaborating interests is felt more.

Shri K. K. Warior: So, your Chamber is to safeguard the collaborating interests more than others.

Mr. Chairman: You can form your own opinion.

Shri B. P. Khaitan: I can explain it. We are interested in buying the know-how. We want to give the least terms to the seller but yet we have to give him the price.

Shri K. K. Warior: There are patent rights given to foreign collaborators or foreign-owned companies. Suppose they are not manufacturing those things here. Should these rights be given to them for importing these things only for sometime so that after sometime they may establish the industry here? What should be the attitude taken against those concerns if we find that they are not establishing the industry here?

Shri B. P. Khaitan: The Bill has already taken care of that and we have not objected to that. We have only said that royalties and other things should not be so low that people may be frightened.

Shri K. K. Warior: May I know whether you agree to make a differ-

ence between the drug industry and the other types of industries?

Shri B. P. Khaitan: The Bill has already made that distinction.

Shri K. K. Warior: We have made it. But what is your opinion?

Shri B. P. Khaitan: We have not differed from that.

Dr. C. B. Singh: Mr. Khaitan, may I know how many patents are being utilised in the Calcutta region at the moment?

Shri B. P. Khaitan: I have not got that statistical information.

Dr. C. B. Singh: When we went to Calcutta, we were told that there were in all 8 patents and out of them, probably 4 were being used.

Shri B. P. Khaitan: I will not be able to give that information.

Dr. C. B. Singh: I am telling this to you. This is for your information. Only 4 patents are being used at the moment. My point is this. You have said that for helping research, you would like the period to be extended. That is the main argument. What are you doing to help research in your region? I agree with you that without research you cannot have any new products and that you cannot have more patents. What have you done to make an effort in that direction?

Shri B. P. Khaitan: My argument is based on a commonsense view of the matter, namely, in other foreign countries also, in order to encourage research, they have given a certain period within which a patent should be worked.

Dr. C. B. Singh: What have you done to encourage research here?

Shri B. P. Khaitan: I am answering your question. It is well-known that in India for many years there has been no research. The question is how to encourage research. The idea of research has just started catching up. The question is: Will it encourage research or discourage research if the period is short? That is the viewpoint that you have to consider.

Mr. Chairman: There are several countries which have made this distinction. Take, for example, Canada.

Shri B. P. Khaitan: They are cases of developed countries.

Mr. Chairman: In Italy, they have no patent law for food and drugs industry. Japan had no patent for food and drugs industry. There are many countries like that. Why should you object if we make a difference in the interest of the public?

Shri B. P. Khaitan: All that I can say is this. You have to decide between the two views.

Mr. Chairman: There are some countries which have given 5 years or 7 years period for food and drugs industry.

Shri B. P. Khaitan: Those facts are to be considered by you.

Dr. C. B. Singh: In Calcutta, there is a post-graduate medical institute. Have you heard about it?

Shri B. P. Khaitan: I have not heard about it.

Dr. C. B. Singh: You have mentioned that in clause 48, there is no mention of royalty. What do you want? You want the royalty to be paid when this is to be acquired.

Shri B. P. Khaitan: Yes. I have already said that when there is compulsory acquisition by the Government, the objectives or the purposes for which it is to be acquired should be specified and there should be a provision or royalty also. It is implied that there will be a royalty ...

Dr. C. B. Singh: What do you suggest? Would you like to suggest any figure here? Would you like that to be agreed to by the two parties concerned, by the Government and the other party, by mutual arrangement?

Shri B. P. Khaitan: It is all right if it is by mutual agreement. But, if it is forced, there should be a ceiling provided for as in the case of private users.

Dr. C. B. Singh: You have not made any mention about the right of appeal. At the moment, in case of dispute, the right of appeal entirely rests with the Drug Controller or it comes to the Government. Do you agree to this?

Shri B. P. Khaitan: We have not suggested that. The right of appeal should be to a judicial body. Either it may be an administrative tribunal with judicial bias or a high court.

Dr. C. B. Singh: Do you agree with the setting up of a special Patent Tribunal as is the case in some foreign countries?

Shri B. P. Khaitan: So long as the judicial authorities are there, it does not make much difference.

Dr. C. B. Singh: My last question is this. You have laid too much stress that the patents should be for a product. You have dealt with that in your memorandum. On this, we have varying opinions. You have mentioned two countries where they are patenting the process. But there are many other countries to-day where they are patenting what are called products; then there are others who are patenting both process and products. What are the reasons for your laying too much stress on products alone?

Shri B. P. Khaitan: That is because of a majority of our members representing pharmaceutical industries favouring this. The two views are already there. Personally I cannot understand the difference between the two and tell which is more important. But, since a majority of our members wanted it, we have laid stress on this.

Dr. C. B. Singh: A majority of the people are in favour of products and not in favour of process. You cannot give the reasons because you do not understand the difference between the two.

Shri B. P. Khaitan: I have not been able to understand the difference between the two myself, this being a technical matter.

Shri M. L. Jadhav: You say that the period is for 20 years. Is it from the date of application?

Shri B. P. Khaitan: We have suggested 16 years. It should be from the date of grant of patent.

Mr. Chairman: They have already answered this question.

Shri M. L. Jadhav: Can you tell me whether the cost of medicines which are manufactured here in India is higher than the imported medicines?

Shri B. P. Khaitan: We have no knowledge of it.

Shri B. Kalyanasundaram: We have got another Association called Indian Chemical Manufacturers' Association. Perhaps that body has been called for giving evidence before this Committee. Since this is a technical matter, they would be in a better position to answer this question.

Mr. Chairman: It seems they are not competent to answer.

Shri Arjun Arora: Do you have any information about the higher rate of royalty and the lower rate of royalty paid by your Members to foreign collaborators?

Shri B. P. Khaitan: We have no information about that.

Shri Arjun Arora: Will you be able to collect this information and send it on to the Committee within a fortnight or so?

Shri B. P. Khaitan: We shall make an attempt.

Shri Arjun Arora: I hope you will be successful if you make serious efforts.

Shri B. P. Khaitan: I think collaboration agreements provide for royalties varying from 2 to 10 per cent. Of course, now, Government usually sanctions between 2½ per cent and 5 per cent. This varies with the importance of the industries.

Shri Arjun Arora: I don't want you to elucidate the government's policy. We have the Industry's Minister here. He will do so if necessary. What is the rate of royalty that your members want?

Shri B. P. Khaitan: All these collaboration agreements are with the Industry Ministry. The rates are also there. So I need not make an attempt to send you the information.

Shri Arjun Arora: Another question is this. You made a mention about research and development. You emphasised the importance of research in a developing economy. Have you given any thought to the development of drug industry in a country like Italy where there is no patent law?

Shri B. P. Khaitan: I am not competent to express any opinion.

Mr. Chairman: They have no knowledge of it.

Shri Arjun Arora: Do you have some information about Japan where there is no patent law? When they were developing, they had the patent law. They considered themselves that they had developed sufficiently to protect themselves. Now there is no patent law.

Shri B. P. Khaitan: On these subjects, I am not competent to say anything. As I said already, I have expressed my views from a commonsense point of view.

Shri Arjun Arora: Why do you insist on 16 or 20 years from the commonsense point of view? Why not six to seven years?

Shri B. P. Khaitan: That is my commonsense view.

Shri M. R. Shervani: I hope you will appreciate that this Bill is intended to increase the industrial growth and industrial development rather than to retard it. As far as the period of 16 years is concerned—this is what you recommend—don't you think that if the period is shortened, it will help the people to come into the industry to develop a particular product or process sooner and we will have more production?

Shri B. P. Khaitan: The whole point is that we have not undertaken that research so far. We are only concerned with the results. We must encourage research. We have to judge whether a longer period of protection will inspire the people to go in for research or not.

Mr. Chairman: Till now we had a longer period. Has it increased the research?

Shri B. P. Khaitan: Since when we had a longer period?

Mr. Chairman: Since 1947.

Shri B. P. Khaitan: This longer period has no meaning. The law is there. But the encouragement is not there. You know, Sir, Lancashire cotton had to be brought here to be converted into cloth. Similarly, jute went to Dundee. Such being the case, how can we think of research. During these 17 years we were busy in many other directions. The idea of research has now come to us by

way of contacts with foreign countries and foreigners.

Shri M. R. Shervani: The greater the production lesser the chance of development because other people would be discouraged. Where the patent is there and even if the period of the patent is shortened as in the Bill, still you will have five years lead over somebody else. That is more than sufficient to keep ahead of others who will put up industry on expiry of patent.

Shri B. P. Khaitan: To judge whether five years is sufficient, one has to take into account all the expenses and efforts which he has put in in order to do the research. So far as we are concerned, in our judgment, it appears that longer period would be better. You cannot objectively satisfy yourself. For this, what you have to do is to make a balance between the two objectives—one objective is to remove restricted practices and make them open to as many people as possible and the other objective is to see that research takes place. People are not shy of making research and putting in efforts because they think that after making their research, they are getting back their cost of research. You have to balance the two.

Shri M. R. Shervani: In your memorandum, you suggest that the minimum period of exclusive exploitation should be 16 years.

Shri B. P. Khaitan: That is what we have suggested.

Shri A. T. Sarma: In your memorandum you have suggested complete scrapping up of clauses 87 and 88. But the grounds given are not sound. Will you substantiate your statement?

Shri B. Kalyanasundaram: This clause provides that the royalty rate should not exceed 4 per cent. We feel that fixing up of a ceiling will not be conducive to get foreign interests here. So, our suggestion is that, instead of fixing a rate under a statute, leave it to be negotiated between the parties by agreement. After all, the agreements are screened by Government. So Government have an effective say to regulate the rate of royalty. Wherever they feel that it is excessive, they need not give their consent to the agreement. So, as I said, instead of fixing the rate under a statute, you may leave it to be negotiated between the parties and Government has already got the power to screen it. That is sufficient.

Shri A. T. Sarma: Then there will not be any limit to royalty. There will be an inventor who will claim 80 per cent and you are bound to give it. Will it not be detrimental to the interest of the country? You may suggest increasing the rate of royalty. But you say that both the clauses should be dropped. There is a vast difference in increasing the royalty and dropping the clauses altogether.

Shri B. P. Khaitan: All collaboration agreements have to be approved by Government. Therefore, even if these clauses are not there, unless the Government sanctions, no royalty can be agreed to and no agreement can be finalised. So the purpose of that clause is served in that manner. As I said in the opening portion of my evidence, either raise the royalty which could be compulsorily fixed or leave it for negotiation between the parties subject to the overall control of the Government, which is already there.

Shri A. T. Sarma: You do not want these clauses at all?

Shri B. P. Khaitan: We have explained our view points. It is for you to decide.

Mr. Chairman: We were given to understand that 2 to 3-1|2 per cent is the royalty that is normally paid and 4 per cent is quite liberal. **What is your view?**

Shri B. P. Khaitan: We have already suggested that it should be left to be negotiated between the parties. While actually fixing the royalty, it may be 4 per cent or 3 per cent or even 2 per cent. In particular cases, 4 per cent may not be sufficient. If you make 4 per cent as the ceiling, then even if you feel that a higher rate is justifiable, you will not be able to pay.

श्री चौरड़िया : आप चाहते हैं कि अवधि बढ़ा कर सोलह साल रखी जाए। दूसरी ओर हमारे सामने उपभोक्ताओं का प्रश्न भी है। पेटैंट राइट अगर ज्यादा देर तक रहता है तो उपभोक्ता को अधिक मूल्य देना पड़ता है। मैं कुछ आपको उदाहरण देता हूं। विटामिन बी 12 की प्रारम्भिक मार्किट प्राइस 2000 रुपये फी ग्राम थी और बाद में चल कर 40 रुपये फी ग्राम हो गई। इसी तरह से स्ट्रेप्टोमाइसीन की पहले 19 रुपये फी ग्राम थी और बाद में एक रुपया फी ग्राम हो गई। क्लोरमफेनीकाल की 1900 रुपये किलोग्राम थी जो बाद में 240 रुपये किलोग्राम हो गई। इस तरह की कितनी ही मिसालें हैं। एक ओर तो रिसर्च के लिए इंसेंटिव देने का प्रश्न है और दूसरी ओर कंज्यूमर को उचित मूल्य पर ये चीजें मिल सकें, यह प्रश्न है। इन दोनों का हल हमें निकालना है। इसके लिए आप कौन सा तरीका सुझाते हैं? प्राइस कंट्रोल की परम्परा जो पहले से चली आ रही है, उसके बारे में आपकी क्या राय है।

श्री खेतान : हम आपके साथ सहमत हैं। प्राइस कंट्रोल जहां पर आप कर सकते हैं करें। आलरेडी यह चीज़ चल रही है। पहले से ही प्राइस कंट्रोल की परम्परा है।

श्री चौरड़िया : कम्पलसरी एक्विजिशन पेटैंट का करने के बारे में आपको आपत्ति है। मैं जानना चाहता हूं कि क्या कोई ऐसी परिस्थितियां हैं जिन में आप गवर्नमेंट को इस बात का अधिकार देने के लिए सहमत हैं कि उन परिस्थितियों में यदि सरकार चाहे तो उसको उपयोग में ला सकती है?

श्री खेतान : डिफेंस की आवश्यकतायें हों तो ऐसा किया जा सकता है। फूड शार्टेज हो, फेमिन हो तो उसके लिए ऐसा किया जा सकता है।

श्री चौरड़िया : आपका व्यापारियों का चैम्बर है। जो निर्माता हैं वे भी व्यापारियों का ही एक सेक्शन है एक तरह से। ड्रग्ज वगैरह के जो निर्माता हैं उनका यह कथन रहा है कि हमारे लिये पेटैंट ला नहीं होना चाहिये, इससे हमारे निर्माण में दिक्कतें पैदा होती हैं। उनकी मुख्य दलील यह थी कि आज हम डिवेलेप्ड नहीं हैं पूरी तरह से। पहले हम नकल करलें, फिर उसमें सुधार करलें और फिर नई नई खोज करके हम अपने यहां पर विकास कर सकते हैं। आपका जो चैम्बर आफ कामर्स है यह एक्सचेंज में ज्यादा विश्वास करता है। उधर से खरीद कर इधर बेचने में और इधर से खरीद कर उधर बेचने में ज्यादा विश्वास करता है। आप चाहते हैं कि सोलह वर्ष की अवधि हो। अब हम बड़े धर्म-संकट में पड़े हुए हैं कि हम आपका कथन मानें या निर्माण करने वालों का कथन मानें। हम चाहेंगे कि आप हम को मार्ग-दर्शन दें।

श्री खेतान : बेसिक चीज़ यह है कि पेटेन्ट राइट्स को प्रिज़र्व करना पड़ेगा, वर्ना रिसर्च नहीं होगी। कोई आदमी कोई नई चीज़ क्यों बनायेगा, अगर वह उसको बनाने के बाद उसका फल एन्जाय न कर सके? हमने पहले ही अपने से व्यूज़ रख दिये हैं कि इस बिल के आबजेक्टिव्ज़ से हम लोग सहमत हैं, लेकिन साथ साथ दोनों की आवश्यकताओं का संतुलन आपको करना पड़ेगा। यह आप के सोचने की बात है कि आप यह किस तरह से करें।

Mr. Chairman: All the patentees are not carrying on research in India. They are not even manufacturing the patented articles here.

Shri B. P. Khaitan: That is so.

Mr. Chairman: It is to prevent such abuses that this provision is there.

Shri B. P. Khaitan: There are two parts here: one is government user and the other is private parties. So far as private parties are concerned, the Bill provides for adequate compensation. But so far as government user is concerned, it has been left vague and the area for which the compulsory acquisition can be made has not been defined. Therefore, so far as government is concerned, it should be defined that it can be acquired only for specific purposes under certain conditions and in the case of private parties, an opportunity should be given to the patentee, "well, you have not utilised your patent; utilise it within six months; otherwise, we will acquire it."

Mr. Chairman: When he has not utilised it within a reasonable period, why should he be given a further opportunity?

Shri B. P. Khaitan: He might not have been able to utilise it due to circumstances beyond his control and if he is given another two or three months, he may be able to utilise it.

श्री चौरड़िया : क्या आपको ज्ञात है कि पेटेन्ट की सिक्युरिटी होने की वजह से ही विदेशी कम्पनियां अन्तर्राष्ट्रीय बाज़ार में कम कीमत पर माल बेचती हैं और वही माल भारतवर्ष के बाज़ार में ऊंचे दाम पर बेचतीं हैं इसी के सम्बन्ध में यू० एस० ए० की सीनेट की रिपोर्ट नम्बर 448 में कहा गया हैं :

India which does grant patent on drug products, provides an interesting case example. The prices in India for the broad spectrum antibiotics, Aureomycin and Achromycin are among the highest in the world. As a matter of fact, in drugs generally, India ranks amongst the highest priced nations of the world—a case of inverse relationship between *per capita* income and the level of drug prices.

ऐसी स्थिति में अगर हम आपके कथनानुसार पेटेन्ट की अवधि 16 वर्ष कर दें, तो हम और आफ़त में फंस जायेंगे, जबकि हमारी आमदनी पहले ही कम है और संसार के मुकाबले में हम से अधिक पैसे लिये जाते हैं। जब आप हमारे आबजेक्टिव्ज़ से सहमत हैं, तब आप हमको कोई ठीक रास्ता बतायें, ताकि हम दोनों साथ साथ चल सकें।

श्री खेतान : उसका और कोई रास्ता निकालना पड़ेगा, जैसे प्राइस कंट्रोल है।

Mr. Chairman: I would like to point out this to you. Please see clause 102 which says:

"The Central Government may, if satisfied that it is necessary that an invention which is the subject of an application for a patent or a patent should be acquired from the applicant or the patentee for a public purpose, publish a notification to that effect....."

So, both public purpose and notification are there. It will be done by notification.

Shri B. P. Khaitan: We have only suggested that the purposes should also be defined.

Mr. Chairman: It will be a public purpose. Notification will certainly mention it.

Shri B. P. Khaitan: Government have got unlimited rights. I may also say that clause 102 has to be read with clause 99 which says:

"For the purposes of this Chapter, an invention is said to be

used for the purposes of Government if it is made, used, exercised or vended for the purposes of the Central Government, a State Government, or Government undertaking or any other undertaking in a class or classes of industries which the Central Government, having regard to the interests of the general public may notify in this behalf in the Official Gazette".

The purposes for which such notification can be issued are not provided.

Mr. Chairman: The notification will mention it.

Shri B. P. Khaitan: Under the Land Acquisition Act, it is provided that it can be acquired for a public purpose and public purpose is defined. In this Bill you do not provide the purposes for which Government can acquire.

Shri R. Ramanathan Chettiar: Your Chamber's Memorandum, from the beginning to the end, suggests that this will act against the inflow of foreign capital in India. You know that the purpose of this Bill is to prevent foreign capital coming here on a monopolistic basis. We can have foreign capital on a collaboration basis with our Indian entrepreneurs, but not on the basis of cartels or monopoly basis. That is the object of the Bill, and I am sure you will agree with this. Unfortunately your memorandum gives an impression different from this. This is at least the impression I got reading between lines of your memorandum.

Shri B. P. Khaitan: We never meant that. We said that foreign collaboration is now on the basis of 25 per cent participation and if their rights are not protected they will not collaborate. This is what we meant. We never meant the other thing. In fact we agree with you.

Shri R. Ramanathan Chettiar: Another point is, you are stressing more on the product rather than the process. Have you any objection to this Bill covering process-cum-product?

Shri B. P. Khaitan: That will meet our point.

Shri B. K. Das: In your opinion the clause relating to licence of rights is the most objectionable. This is a special clause provided so that any person can exploit any patent for preparing drugs and medicines. Royalty has been provided and other provisions are also there. Why do you object so much to this clause especially when high prices are charged by foreign patentees? They are only importing and not exploiting the patents here. We are trying to make a special provision for manufacture of drugs in this country so that all this misuse may be eliminated. Why do you object to this?

Shri B. Kalyanasundaram: We have explained that in our memorandum. Something is manufactured out of very expensive research by somebody, and somebody else gets hold of a licence and starts manufacturing it.

Shri B. K. Das: In the life time of the patent, nobody can ask for it.

Shri B. Kalyanasundaram: We have made a specific suggestion. That is to give notice to the patent-holder that if he does not produce it, we shall give licence.

Shri B. K. Das: That means you are in favour of compulsory licensing.

Shri B. Kalyanasundaram: Yes, after giving an opportunity to the patent holder.

सरदार दलजीत सिंह : आल इंडिया मैन्युफैक्चरर्स एसोसियेशन और दूसरे एसोसिएशंस ने कल यह कहा है कि फारेनर्स अपना पेटेंट यहां रजिस्टर करा लेते हैं लेकिन मैन्युफैक्चर नहीं करते हैं ताकि हिन्दुस्तान वाले उसको मैन्युफैक्चर न कर पायें और एक बात यह बतायी है कि बहुत सा माल इम्पोर्ट किया जाता है, वह मैन्युफैक्चर नहीं करते, बल्कि ब्लैक मार्केट में देते हैं। लेकिन आपने यह

राय दी है कि इन तमाम कंट्रीज़ से राय लेकर इस बिल को तैयार किया जाय जैसे कि यू० के० है, फ्रांस है, वेस्ट जर्मनी वगैरह हैं, तो मैं जानना चाहता हूं कि उनकी राय और आपकी राय में यह अन्तर क्यों है ?

Shri B. P. Khaitan: I think we have basically answered this question and that is about price control and all that. If patent is not used, then after giving notice to the patent-holder other people should be allowed to use it. We have covered all these points either by implication or expressly.

Sardar Daljit Singh: You have said that in 1961 the United Nations passed a Resolution that its Secretary General should report on the existing patent systems in developed countries and the role of patents in the transfer of technology from developed to developing countries. May I know which technology has been.....

Mr. Chairman: That has been covered.

Shri Shyamnandan Mishra: One construction generally put in for the strong plea that the Indian industrialists make for patent rights is that it is not because of their solicitude for the Indian enterprise and initiative so much in this field but because they want to enter into some kind of collaboration agreement with foreign patentees and thereby they also want to enjoy all those privileges and rights that would be granted to foreign patentees. Will the witnesses kindly clear this point so far as this popular misconception or misunderstanding is concerned?

Shri B. P. Khaitan: This is based on a slight misconception. We will not be able to induce a foreign patentholder to bring his knowledge to India and transfer his patent or collaborate with us unless his product is protected. It is not for protection of the Indian collaborator, it is because he will not collaborate with us unless his rights are protected. We are in need of foreign know-how. This is the fundamental basis on which this opinion has been expressed. We can induce a foreign collaborator to come here on the basis of his rights being protected. If his rights are not protected he will not come.

Shri Shyamnandan Mishra: Know-how is a different thing altogether from patent. Know-how can be purchased as is done in many countries. Of course, know-how is associated with patent, but know-how can be purchased.

Shri B. P. Khaitan: Know-how is certainly a wider term than patent, but patent is nothing but know-how.

Shri M. R. Shervani: With regard to clauses 87 and 88 you say that these clauses may have serious adverse repercussion on research. May I know whether the expenses incurred on research are allowed by the income-tax laws as revenue expenditure or not?

Shri B. Kalyanasundaram: Yes.

Shri M. R. Shervani: That means the State Government or the Government of India has already contributed 50 per cent towards the cost of research and the amount spent by the parties on research would be half their actual expenditure?

Shri B. Kalyanasundaram: Our approach has been slightly different. We are talking of research done in foreign countries and the product arrived at by reason of that research and patented here.

Shri M. R. Shervani: In foreign countries also research expenditure is allowed by the income-tax department. That means the actual expenditure on research is less than half the total expenditure. Is that right?

Shri B. Kalyanasundaram: That could be.

Shri M. R. Shervani: You say that compulsory licensing or licensing of rights would result in all sorts of people getting free licences and manufacturing drugs of inferior quality.

Why should you have lack of confidence in the judgment of the Controller? The Controller grants a licence only after taking into consideration the financial capacity and technical ability of the party concerned.

Shri B. Kalyanasundaram: You cannot take it for granted that whenever the Controller gives a licence he will give it only to parties who can do the job properly. We know that in the matter of industrial licensing so many have become infructuous. Therefore, there cannot be any presumption that because the Controller gives the licences the parties will be able to do the job.

Mr. Chairman: We have no more questions to ask you. Thank you very much for coming and helping the committee by giving evidence.

(The witnesses then withdrew).

H. Associated Chambers of Commerce and Industry of India, Calcutta.

Spokesmen:

(1) Mr. C. A. Pitts.

(2) Mr. A. B. Parakh.

(3) Mr. I. Mackinnon.

(The witnesses were called in and they took their seats)

Mr. Chairman: The evidence that you give is public. It will be printed and distributed to the members of the Committee and Members of Parliament and also laid on the Table of the House. Even if you want any particular portion to be treated as confidential, it will be printed as circulated to the Members of Parliament.

We have received yonr memorandum and it has been circulated to Members. If you want to make out any new point, or stress some particular point, you may do so. Afterwards, our members will ask questions.

Mr. C. A. Pitts: First of all, gentlemen, may I thank you for this opportunity for the Associated Chambers of Commerce and Industry to present their point of view to you in person? May I perhaps begin with just a word about the nature of the organisation which we represent?

The Associated Chambers of Commerce and Industry, or ASSOCHAM as it is usually called for short, is an apex organisation on the top of 11 chambers of commerce and industry which in fact cover the whole of India geographically. These 11 chambers altogether have more than 2,500 member-companies, and these companies employ more than two million men and women. The organisation represents strongly wholly Indian industry, but it also represents, again strongly, many examples of collaboration and partnership between Indian and foreign concerns. And, finally, there is to be found within its ranks every conceivable kind of industrial activity, right from the traditional industries such as tea, coal and jute right through to the most modern industries employing the very latest technology available in the world.

We three, gentlemen do not come before you as legal experts in the context of patent law. We are practising men of business, professional managers who live and work in India, and it is not our task to be concerned with any high-strung discussions of the principles of private ownership, or technical property, or anything of that kind. We are concerned in our comments only with the practical down to earth effects of this Bill on the pace of development of India's industrial plans. We would like to submit that against this general background, it is necessary to view the Patents Bill not as a Bill by itself in isolation, but just as a tool or as part of a set of tools in the hands of the Government and the executive, designed for ensuring the effective and the prompt development of India's industrial economy and for safeguarding the essential interests of that economy and hence of the Indian nation. Now, against these criteria, how, in

Ascham's view, does this Bill measure out? It is, in our considered judgment, a Bill which contains certain provisions which far from accelerating the pace of India's industrial development, will tend to slow it down and prove not beneficial but harmful to the public interest. There is also, we feel, a tendency to regard this Bill as being concerned almost essentially with food and with drugs. But in our view, this is misleading. A number of provisions of this Bill—*e.g.* clauses 48, 53, 89, 93, 99, 100 and 116—have a direct effect on the total climate as it were which affects all of industry within this country. More specifically, clause 87(a) (iii) dealing with licences of right seems to us to affect the whole of the chemical industry; and the chemical industry is, of course, a very wide and a very diverse thing which includes products as different as modern plastics and polymers, synthetic fibres, dyestuffs, modern synthetic paints and so on, as well as the whole range of organic and inorganic chemicals.

Now, we would like the Bill to be considered—we think it could be considered most usefully—under two broad headings; first what we regard as its domestic effect within India and secondly what we would regard as its international effect.

Now, it is our contention, gentlemen, as set out in our memorandum, that the cumulative effect of those powers in the Bill which are totally reserved to Government, as in clause 48, the summary and retrospective curtailment of the terms of the patents as in clause 53, and the clauses relating to licence of right set out in 87 and 88, would be to remove—I can give some instances—or greatly reduce that protection which has hitherto been accorded to the fruits of research and invention and, in our view, the effect of this domestically can only be to discourage research, and even where research continues to be carried on, to cause the results of it to be suppressed. This, in our view, would be a very great loss to the nation and a very great loss to the source of important materials for the academic and scientific world of India. We would submit that in the broad context of what India is trying to do, it is difficult to reconcile such a policy which we believe to be inherent in this Bill, with the call that the Government through its leaders and Ministers has been making in recent months to industry for a great increase in the research efforts in the drive to achieve self-sufficiency. Ministers have gone so far as to suggest in public addresses that they would consider greater incentives in order to promote a greater effort on research. And it does seem to us that in this area, the effect of this Bill as we see it, is incompatible with that declared policy of Government.

This is a highly technical modern world. Science and technology call the tune in the pace of industrial advancement as can be seen by a glance at any of the leading industrialised countries of the world. It seems to us—we submit this view with all deference—that it is contrary to the national interests that in this year 1966 India should be initiating an action which, in our view, will discourage and deter research and development and would encourage the suppression of important scientific information. There is another point here. Let us consider the effect of this on the large body of extremely able young Indians who are now beginning to be turned out of academic institutions, highly trained and ready and eager to participate in a research effort which will benefit their country. We believe that the by-product of this depressant to research will be a correspondingly greater temptation for these young men to go elsewhere in the world to find the satisfaction that they will be deprived of in their own country. India will find itself faced with an increasing "brain drain" as it is being called in other parts of the world.

Internationally, in the view of Assocham, this Bill could have a num-

ber of harmful effects. Here again I would like to make a reference to what has been declared to be Government's policy regarding foreign investment and the need to achieve a more rapid implementation of India's Plans to encourage foreign investment and the importation of modern technology in those fields where it is thought that it would be a matter of priority. Almost all the highly industrialised countries of the world, who are owners of this extremely modern technology which India desires, adhere to the principle of strong patent protection. Even those countries who hitherto have been outside of this, such as Italy, are now reported to be coming into line and having within their country a law which does afford a strong patent protection. In Russia, too, which is, so to speak, outside the democratic world, has seen the value and the force of such a system of protection. The whole trend in the industrialised countries is towards harmonising their patent laws so that they are in step with each other so as to encourage and make easy trade in technical information and indeed trade in technical products. It is our judgment that the effect of this Bill will be to breed dismay in the minds of those owners of modern technology overseas who are interested in India as an area of investment because they see apparently a wish of the Government of India substantially to reduce the protection afforded to patents not only in the future but summarily, so to speak, in respect of patent protection already granted. But more than that, we believe that these countries, because of this, will be reluctant to seal their patents in India and to publish the extremely valuable scientific information that they contain. This will be a great loss to India's academic and scientific institutions. I would like, if I may, for a moment to draw attention to the difficulties which this Bill would bring in the way of the movement of goods for exports. If India's patent laws are not generally in line with those of the world to which she seeks to export her manufactured goods, impediments to export are likely to arise in those cases where goods manufactured in India outside of patents are sought to be sold in countries in which they are still covered by valid patents.

There is another aspect which we have not touched in our Memorandum. India is rightly regarded as the leader among the developing countries of the world, and the kind of patent law that she brings into effect is likely to be something of a leader in the eyes of the countries who are following her. Now if they follow what, with respect, may I call a bad example, India would suffer in the future when she herself wishes to sell in such areas, the fruits of her own research. Conversely if those countries in fact do not follow this example but adhere more closely to the conventions which are practised in the West, then India would suffer by comparison as being an area which is comparatively less attractive to foreign investment than those newly developing countries.

I would like also, Gentlemen, if I may just for a moment to suggest that some consideration be given to the practical effects of some of these clauses. If pharmaceutical patents are to be limited to 10 years, it is I think demonstrable that in many important cases, beneficial production does not really begin until 7 years have elapsed from the date of the sealing of the patent, which means that only 3 years are left to the owner in which to recover the very large expenditure on research and testing and development—leave alone to recover any expenditure which has proved abortive on other products. Now what is he to do in these 3 years. The logical answer would be to pitch the price so abnormally high that he will be able to recover in a short time this expenditure. This seems to be precisely what Government of India wishes to avoid. It wishes the prices to be kept as low as possible. It seems logical that where protection is given, it should be given for sufficiently long period so that money can be recovered

steadily and not suddenly in very large lumps and we strongly urge that there should no discrimination in the matter of treatment of patents against the drugs industry. Indeed, we could, I think, easily adduce arguments for, in certain instances, granting a longer term of patent protection to certain kinds of drugs.

May we, Gentlemen, just for a moment, also consider the practical effects of the proposal in clause 87 concerning "Licence of Right". It seems to us that simuleaneously with the publication of the patent affecting drugs, or food or chemical substances, any person—presumably any number of persons—can as a right become the possessor of a licence. The only thing to be settled is the terms which the owner of that patent will give to the individual licence holder. One could imagine a situation where—particularly when it is a promising looking patent—one dozen, two dozen or 5 dozen people may want a licence. The unfortunate Controller will have to try to determine what are the reasonable terms for all of them. When they get the licence and get their terms, how does it tie in with the industry's development. Do they all go over to another section of the Government to get a licence? If all 25 or 35 get such a licence, is any one of them in fact going to or willing in such a competitive situation to implement it. Of course when he has got the licence, he has only got the licence; he has not got the know-how, which is a separate subject.

These clauses 87 and 88 pertaining to these Licences of Right will in fact lead to a chaos and a very large load of wasteful administrative work with little or no compensating benefit to the country.

An hon. Member: Will lead to chaos?

Mr. C. A. Pitts: Probably chaos is a strong word. What I mean is there may be very many many people all trying to get the same licence. The Controller will be charged with trying to arrange for mutual terms. They have got to decide about the licence which is another heavy load of administrative work. I am sorry, Sir, I withdraw the word.

Finally, Gentlemen, we would like to make a brief reference to the question of appeals which in the view of ASSCHAM are adequately catered for in the Bill. We would like to recommend that in addition a judicial Appellate Tribunal be set up which in our opinion, would do much to restore the confidence which some of the proposed measures have taken away.

Now all that I have said, I am afraid, has so far been rather destructive. I would, if I may, like to end on a constructive note. We do accept, of course, the fact that a Act that has been on the Statute Book since 1911 does need to be brought upto date in number of respects. I would also like to submit that the Act as amended has in fact stood the test of time very well and that if there is any need to make any additional provisions so that the products or processes which are vital to the economy, be brought into production quickly, then let it be done simply with no corresponding psychological or deterrent effects by modifying and revising those clauses relating to compulsory licences. That is, Sir, as much as I have to say as a general comment.

Dr. C. B. Singh: Mr. Pitt, you have been talking about research. I entirely agree with your remarks. May I know what effort your organisation is making towards that? Have you some idea about the money being spent or the people being paid as far as research is concerned.

Mr. C. A. Pitts: I think you are asking about the inside effort. Or are you referring to the world effort?

Dr. C. B. Singh: Your effort inside and outside both.

Mr. C. A. Pitts: As far as ASSCHAM is concerned, the situation differs from one industry to another and I think it would not be proper for me at the moment to

answer for lack of reliable information with me. Perhaps Mr. Mackinnon could talk about the pharmaceutical industry and Mr. Parikh could talk about those industries with which he is personally familiar. As far as ICI is concerned, it spends a large amount of money on research and development. The figure, I think, is round about 20 million pounds a year. It may even be more. I would not like you to regard it as an accurate figure.

Shri R. Ramanathan Chettiar: What is the percentage?

Mr. C. A. Pitts: It would be of the order of 3 to 3½ per cent. In India, the ICI, having to manufacture in a number of fields, is now doing research work essentially of the applied nature in order to make the fullest use of Indian raw-materials, in order to adopt processes suitable in Indian conditions and a very great effort is being made to train Indian staff not only within India but through other members of the ICI Group across the world.

Dr. C. B. Singh: May I know the percentage spent on Research in the pharmaceutical industry?

Mr. I. Mackinnon: Mr. Chairman, I am not here to speak on behalf of the pharmaceutical industry, and I am very anxious that anything I say may not be taken as contradictory to what the representatives of the pharmaceutical industry state themselves. I can speak only from personal knowledge. Pharmaceutical industry is essentially a research and development based industry. It is my impression that those members of the industry who are concerned with the development and manufacture of modern drugs are today spending some 2 per cent of their turnover on research and development. This would be the approximate figure in my own organization and I have had the privilege of showing. Mr. Chairman and some of the distinguished members of this Committee what that effort looks like on the ground. But I would be the first to concede that this effort is small in relation to the effort that is being put into pharmaceutical research in other countries of the world. In some developed countries of the world the proportion of turnover would be somewhat in excess of 5 per cent, and in some cases, expected to be above 10 per cent. I would submit, Mr. Chairman. that the figure in India, which is low, has nothing to do with the previous or the existing patent legislation. It is essentially a matter of the present stage of industrial development in the country. In a comparatively short time, the drug industry has developed from being a relatively small collection of distributors to being a manufacturer using some of the most advanced modern technology in the production of drugs anywhere in the world. And it is the next stage in the industry's development where research and development necessarily take place here in India, partly in order to protect that investment that has already been made against competition either from within India or outside, partly to improve on the methods and the processes that are being used in various companies in the industry, and partly to development of new methods of manufacturing drugs, new advance in medicine and to take full advantage of Indian raw-materials, Indian scientists and technical staff. We have in our industry a very large measure of expertise that we have been able to develop over the last 10—15 years. I submit that with adequate patent protection, this figure of percentage on research is bound to rise in next course of the industry's growth and development.

Dr. C. B. Singh: You think that just by a strong patent law the research will be automatically improved in this country? Is that your contention?

Mr. I. Mackinnon: Yes, Sir, other things being equal.

Dr. C. B. Singh: My feeling is that 2 per cent figure is a little higher figure. Evidence has come here that in India—in Eastern or western part—hardly anything has been done as far as research is concerned. 2 per cent is a very big sum. If your figure is correct, I would be happy. But my feeling is that definitely not even 1 per cent is being spent as far as research is concerned. My feeling is that our patent law is already strong enough—16 years protection has been provided; there is nothing wrong with it; there were certain defects that we are modifying. In spite of a strong patent law, hardly anything has been done in this country. That is our trouble. Supposing we make these changes, how could we be sure that they will be spending more money on research? Research, as you know, is the very basis of finding new methods. Just by a strong patent law, will it be possible for you to spend more money on research, or something else has got to be done? That is my question.

Mr. I. Mackinnon: In answer to this question, I would say that I have made a statement originally that I can speak only of a certain group of companies in the pharmaceutical industry who are using imported technology in the production of modern drugs. I cannot speak for the pharmaceutical industry as a whole. My figure of 2 per cent, I am sure, will be substantiated by the representatives of PPI who appeared before you a few days back. I am sure, that figure is broadly speaking, correct. But I entirely agree that it is a low figure. But it seems to me that one first establishes a process, one first gets manufacture going on economic basis, and then you turn to the research and development. But this will happen when the patent protection is strong and adequate.

Dr. C. B. Singh: We have already three types of protections, *viz.*, (i) product protection, (ii) process protection and (iii) product-*cum*-process protection. Now you have mostly pleaded for product protection. Why?

Mr. I. Mackinnon: If I have given the impression of so pleading, it was not intentional. I am not going into the relative merits of products as against processes over the whole range of industry. I am not so qualified to say that. We thought we shall be able to get some better idea from you Anyway it is all right if you cannot express an opinion on that.

My second point is about clause 48. You have mentioned that this clause should be deleted more or less almost because it cuts at the root of very protection. You remember we are having certain difficulty—I am talking about certain particular drugs for T.B. etc. and other vital drugs—these are very common drugs and we know in the use of these drugs those who have patent charge very high prices. So with that aim in view to make it impossible for those patentees Government will be able to take advantage of this clause and get these drugs either from here or by importing them. That is why we have put this clause. What you have to say about it?

Mr. C. A. Pitts: We take the view that Government here assumes, in fact, total power to declare as free of infringement any patent of anything. What we say is that this total power has a psychological effect and is a deterrent. Government has ample powers elsewhere in the Bill to bring about its wishes either in the chapter 17 and so on or by the device of Compulsory Licences.

Dr. C. B. Singh: So what do you suggest? I agree that Government has ample powers. Will you suggest that Government should pay reasonable compensation while taking over any patent?

Mr. C. A. Pitts: I would say that clause 48 becomes very similar to clauses 99 & 100 and there is no need for clause 48.

Dr. C. B. Singh: I think it does become similar. If that is agreed you agree to a compensation on reasonable terms.

Mr. C. A. Pitts: My point really is clauses 99 & 100 take care of it and Government could achieve its wishes without clause 48 which causes this feeling of total power of the Government taking any patent at any time.

Dr. C. B. Singh: You think that that section is enough for the Government. You want complete deletion of clause 48.

Now what are your views about clauses 87-88? What you think will be an adequate compensation? We have suggested maximum of 4 per cent. Do you agree that maximum of 4 per cent is enough?

Mr. C. A. Pitts: No, Sir. I would suggest that all products and processes are to be considered on their merits. In some cases it could be 4 per cent; in some other cases it can be too much and too little. Some guidelines would have to be formed so that each case could be judged on its merits.

Dr. C. B. Singh: What will you suggest?

Mr. C. A. Pitts: I will say through mutual goodwill on both sides. The suggestion of some judicial body to arbitrate would be the most happy solution.

Dr. C. B. Singh: Clause 116—Appeals. What do you think about the Appeals? The Appeal has been left with Government because there have been people who obstructed and good things have not been supplied to the people at large by certain patent interests. That is why we have brought this clause.

Mr. C. A. Pitts: I think, Sir, the dispute should be dealt with in a different way and not by, so to speak, removing any right to a judicial appeal in the whole of enactment. I think there is already power in this Act to sanction the getting of manufacture pending the result of negotiation. This by itself avoids delay but I do not see why one could not administratively deal with delays.

Dr. C. B. Singh: We cannot go against the High Court. The High Court will not simply listen and, as such this power is being taken over by the Government. What will you suggest in this regard?

Mr. C. A. Pitts: We have suggested Patents Appeal Tribunal consisting of single judge on the lines of the British precedent which according to our information works well.

Shri M. L. Jadhav: You know the Model Law. According to Model Law the term of Patent is for 10 years. Do you agree with it?

Mr. C. A. Pitts: I do not agree with 10 years as the one and the only term. If it is extendable, according to some criteria, if necessary, by another 7 years that I think would be better than the flat 10 years which is inadequate and brings out results which are high prices.

Shri M. L. Jadhav: Are you aware of the fact that the prices of some of the drugs in India are much higher than they are in other developed countries? What would you suggest to bring down these prices?

Mr. I. Mackinnon: Mr. Chairman, I do not accept the statement that on the whole drug prices to the consumer in India are higher than they are in other countries of the world. I do not deny that this may be true in some cases but there are many cases where the consumer has to pay much lower here in India them in other countries. I have no detailed figures to put forward to prove this contention. OPPI representatives will be able

to throw much better light on this aspect.

My own experience why drug prices are as high as they are in India is entirely because costs of manufacture of drugs are as high as they are and the concerns of pharmaceutical manufacturers have to cut down the costs.

The concern of the manufacturers is to keep down the costs. There are two aspects of this. One concerns the high cost of materials and the other concerns the relatively high cost of labour. In so far as materials are concerned, which is a smaller part, the imported material by and large has been until recently subject to rates of duty that are as high as 70 per cent. In addition, there are the freight and landing charges, so that one can say that the average cost of the imported raw material here is something like double what it is in the country where this material originates. For the much larger component, which are raw materials and packing materials purchased locally, it is the experience of the average pharmaceutical manufacturer that they cost between two and three times what they do in the developed countries. This is essentially a reflection of the current state of development of the country.

We all know that until there is a highly developed organic chemical industry here in India which is developing now, the cost of many of the basic materials and intermediates that are used in drug manufacture is necessarily going to be high, but it is our assumption that as industrial and technological development proceeds in those industries that supply us with our raw materials and the packing materials, those costs will come down. Certainly they should come down relatively to other things.

Then, if I may say a word about the other main component, labour, there is, I am afraid, an impression in many minds that this is a low labour cost country. In the pharmaceutical industry, at any rate, it is my experience that this is not true. Our labour costs are relatively high to what they would in other parts of the world. There are two reasons for this. One is inexperience, which it is our duty to do something about. Our hope is that as one progressively trains the workers to be more efficient and to be able to do a wider variety of jobs, the effect will be to reduce the cost of labour per unit of output. But the other principal reason, I think, is that we are working under very much more difficult conditions so far as labour is concerned than in many of the highly automated plants in the West. We operate on a much smaller scale. We do not go in for automation of processes in the drug industry, not even of packing, let alone manufacture, because this is not at the moment technologically feasible, and therefore we are using labour wastefully as compared to some of our opposite numbers elsewhere.

One other point, of course, is that in this country most of us in the larger pharmaceutical companies are paying to our workers dearness allowance on a fairly generous scale based on the cost of living index, and as a result of the rise in the cost of living index over the last year or two, despite what we wish to do and are doing to improve labour efficiency, the cost of labour is, in fact, rising and rising rapidly. Because of this, both on the raw material side and on the labour side, our costs are extremely high, and I would not like to leave the impression that drug prices are high because profits are high. It is my submission that drug prices are high primarily because costs are high. Even so, the prices that the consumer pays for drugs in this country by and large are no higher than in most of the developed countries of the world.

Mr. Chairman: In drugs like chloromycitin, tetracycline, prednisolon, tolbutamide etc., the rate here is 500 to 1100 per cent of that in the other countries.

Mr. I. Mackinnon: I would suggest that the right comparison to make is between the selling price and cost of production, and not the selling price here and the selling price somewhere else. When I had the pleasure of entertaining yourself, Mr. Chairman, and the other Members in my Thana plant, I had explained that one of the products we make, namely Vitamin "A" is priced extremely high in this country compared with world prices, but, in fact, the cost of delivering the raw materials to the factory gate before any manufacture starts at all, is higher than the world price of the finished product. This is something over which we, as manufacturers, have no control at all. I suspect that it is the case in most of the examples you have cited, but I cannot prove it.

Mr. Chairman: These are figures culled out from the report of the Reserve Bank.

Mr. I. Machkinnon: I submit the cost of imported component, the high cost of local labour and other raw materials purchased locally together explain why the cost of production in India is in many cases several times higher than the effective world price. I may add that it is sometimes difficult to know what price is a true reflection of the world prices. It may be a price specially quoted for marginal business to a particular country; it may not be in fact the going price that most consumers have to pay in other parts of the world. I suggest that OPPI are the best people to give a detailed answer to these questions.

Shri Arjun Arora: What would be the best method of securing a progressive reduction of prices of drugs in India?

Mr. C. A. Pitts: If I can make a generalisation here, it is not only drugs. There are many things in this country whose manufacture cost is very much higher than it is in some of the advanced countries of the world. There are many factors. As suggested by Mr. Manubhai Shah—an admirable suggestion, each of these should, in fact, be analysed in little cells set up to look at every ingredient of cost in all the important industries. Is it raw material, is it scale of operation, is it labour, is it excessive overhead, excessive salaries and management, excessive profits, is it the effect of Government policies? The ingredients of cost can be analysed and found in all industries, including drugs, and I would suggest what needs to be done first is to have this open examination of what makes up the cost to see in what ways cost can be brought down. It is very difficult to prescribe a remedy across the table.

Shri Arjun Arora: Don't you agree that the existence of a patent law encourages prices and is to a certain extent responsible for high prices?

Mr. I. Mackinnon: It is our contention that while a patent does, in fact, confer a limited monopoly on a process or a product for a limited period, and to that extent it is possible within the terms of the patent for the manufacturer to charge a higher price during the term of the patent than he would otherwise, the provisions of the patent law, either this one or any other, are not a significant factor in determining the general level of prices. Whether you have a strong patent law or a weak one is not a major determinant of whether prices are generally high or not. Certainly, however, it must be borne in mind that without a strong patent law, costs of production are likely to be higher than they are with a strong patent law, since it will be necessary to acquire the know-how and experience by the long-drawn-out and costly method of development for oneself and all the mistakes and false starts and waste that go into the doing of it. If the effect of a weak patent law is to make the know-how the more costly and to make the cost of production higher than it would otherwise be, I submit it can

be claimed that the prices on the whole are lower as a result of strong patent law than they would be otherwise. I distinguish between individual products where anything can happen in a particular experience, and patented products generally.

Shri Arjun Arora: The witness, I take it, is aware of the case in Britain when they found that because of the patent law they had to buy medicines at a costlier price, they chose to buy drugs from Italy where there is no patent law and thus force the British industry to bring down the prices. In the face of this example, how does he say that if there is no patent law or no patent protection or no patent protection of the order of which he is fond, the prices of drugs will be even higher?

Mr. I. Mackinnon: It is my recollection that there were only two or at the most three products involved here and I have not ruled out the possibility of particular situations in the case of particular products. I was talking about the position of drug prices or any other prices generally. So far as the particular instance that the hon. Member has referred to is concerned, the prices at which these products were imported into the United Kingdom were not the prices at which they were sold to the Italian public, and I believe that OPPI will submit evidence to prove that in a country where there are no drug patents in existence, on the average and in practically every case, the prices to the consumer of the drug are higher than they are in those countries in western Europe where patent protection exists. The fact that the British Government were able to buy large quantities from Italy at extremely low prices, lower than those prevailing in the domestic market, is not to my mind an argument against patents. But I am not an expert in patent law and I am very well aware that there was a particular point in the British patent law which was in dispute there, but it was not so much a question of prices; it was a question whether it was possible to buy drugs for the National Health Service under a new clause in the Act which permitted the use. Since I am not an expert in these things, I should think I should say as little as possible.

Shri Arjun Arora: Can you give us an idea as to whether your members who have secured the patents have recovered the cost involved in research?

Mr. C. A. Pitts: This varies tremendously with the activity.

Shri Arjun Arora: Let us take the commodities called drugs.

Mr. C. R. Pitts: I think these are specialised matters which the OPPI on Friday could handle much more adequately than this delegation. To my knowledge, there are many examples which are in fact not enough to cover the cost, because the technological advance and so on become outmoded before it has been found to recover the cost. May we suggest that the specialised delegation on Friday could handle that subject better?

Shri M. R. Shervâni: I am not very clear about the recovery of expenditure on research. Mr. Mackinnon said that the average expenditure was about two per cent of the turnover. That means that it is only a prosperous company which will spend money on research and earn a profit. When the expenditure is not more than 10 per cent of the profit from year to year, how do you still have 90 per cent profit to pay dividends, etc.? I do not quite understand this point that if there is no strong patent law, the money spent on research would not be recoverable. It is recovered from year to year out of profits. What have you to say about it?

Mr. C. A. Pitts: It is extremely difficult in the generality of cases to deal with the question as to how much is spent and how quickly it is recovered. Our contention in general is that

without strong patent law, the money will not be spent, and innovations and inventions will cease, as has been demonstrated in a country which in fact did away with patents in respect of drugs. As Mr. Mackinnon said earlier—he was talking of two per cent from his personal knowledge—in my personal knowledge, and this is in a sense confidential, the pharmaceutical division of ICI which has a most tremendous research establishment, did for many years together fail to make any money at all, and has made a recurring loss.

Shri M. K. Shervani: Excuse me if I put this question. Suppose there were no patent laws anywhere in the world, would the ICI stop doing research? Because, my point is, research is very necessary for your very existence. It is essential for you to continue to do research.

Mr. C. A. Pitts: Research would go on in selected areas where it is regarded as good commercial risk, but research would become secret and the results will go into the middle ages and they would be a great brake on the whole development of the entire world.

Shri M. R. Shervani: You would continue research for your own development, irrespective of whether you have protection or not.

Mr. C. A. Pitts: The research would then be very much more rigorously scrutinised and screened and done under conditions of extreme secrecy; the result would not be published; it will have a retrogressive effect on the whole academic system of the world.

Shri M. R. Shervani: You are giving advice in the interests of Indian industrial development. That is the basic idea. In your opinion, the present Bill would retard research and would be a disincentive to research. My question is, will it be better for a country which is at the bullock-cart stage to do research on the basis of bullock-carts and cycles and then go to motor-cars, or, should that country take advantage of the existing discoveries of another country which is at the aeroplane stage, and take its help and assistance in developing the country's economy? You want us to give protection to our research scholars and scientists to do research, at the stage we are in, and not take advantage of the research done by other nations of the world?

Mr. C. A. Pitts: I would not treat the subject, so to speak, in that black and white way. I think the greatest asset of any country is the mind of the people and the brains and their creative ability. India does not lack creative ability of the highest order. This must be used in a sensible way. For example, I believe this country is extremely rich in raw materials which can be the base of drugs. This has been proved already and here I would say would be a case for some fundamental long-term research. This is one thing. Then, in another area, we have proved in my own group of companies the creativeness of India, that it can take the process which has been running for 30 years in Britain and make it more efficient, despite all the effort and expense and experience elsewhere in the task. When you bring modern technology to India, a great deal of research is required to adapt the processes to Indian conditions. There is scope for different kinds of research in India which can be profitable.

Shri M. R. Shervani: How long will it take for the Indians to advance to the level of their counterparts in the west?

Mr. C. A. Pitts: It would not be very long. Certain countries have been impressed by the quality of Indian research and they are trying to base some of their research effort in India. I do not think that is very far away. What is important is India should not seek to reprove what has

been proved elsewhere, but build on the foundations which already exist.

Shri M. R. Shervani: What is the ratio of foreign investment in industries manufacturing patented products compared to the investment in industries where there are no patents, say, during the last 5 or 10 years in India?

Mr. C. A. Pitts: I have no evidence about this and my opinion is highly subjective. I think the greater part of foreign investment in India has been in patented products and processes.

Shri M. R. Shervani: My information is that the ratio of investment in 10 years in patented products as compared to the investment in industries of products which are not patented is 1:10.

Mr. C. A. Pitts: I cannot argue it. But my personal experience in the chemical industry with which I am associated is that most of the investment has been in processes and products covered by patents.

Shri M. R. Shervani: My information is that investment made in India as a result of foreign collaboration agreements with Indian firms are much more where there is no patent involved than where there is a patent. So, industrial development does not entirely depend upon patents, but depends more on technical know-how. There is nothing in this Bill which forces anybody to give the technical know-how. The Indian industry will still have to pay for buying the technical know-how from foreign patentees.

Mr. C. A. Pitts: I have no statistics relating to this. But my personal experience in the chemical industry is that much of the investment has been in patented products.

Shri A. T. Sarma: In your memorandum you have said that if the Bill is passed the foreigners would not invest their money in India. Do you substantiate it?

Mr. C. A. Pitts: Yes. The climate for investment would be impaired and the confidence of the investors would be badly shaken if the Bill is passed as it is.

Shri A. T. Sarma: Is it a fact that some foreign firms are being run by Indian experts and technicians?

Mr. C. A. Pitts: Yes; the foreign investors in India would like to train the Indians to run the plant as soon as possible.

Shri A. T. Sarma: Do you think India has to depend on foreign technicians and technology for some years or India can run its industries without foreign aid?

Mr. C. T. Pitts: Once an industry has been properly established, is properly managed and the staff properly trained, in my experience, it quite quickly gets on to the stage where Indian technicians can run it adequately. In the petro-chemical industry, for example, it will be necessary to import initially the technology and to get the Indians trained.

Shri V. M. Chordia: The Indian pharmaceutical producers came here and said that the present Patent Act is a hurdle to industrial development. They say, we are not in a position to invent and design new things. We have to imitate things and improve upon them. If there is a long period for patents, they are not in a position to imitate till the patent period expires. So, they say the period should be very small. In the first instance they say there should be no patent law, but if there is a patent law, the period should be small, so that they can imitate the drugs and sell them to the consumers at a cheap price. What is your view?

Mr. I. Mackinnon: The answer depends on whether we are talking

about a new invention or drug or about duplication of an existing drug covered by a patent. If we are talking about manufacture of existing drugs, the terms of compulsory licence provision suitably amended are adequate and it is not necessary to shorten the term of the patent. If we talk about new inventions, shorter the term of the patent, lesser are the chances of genuine research leading to new discoveries and longer the term of the patent greater are the chances of genuine research.

Shri V. M. Chordia: What is your experience about getting a patent sealed from the date of application? How long does it take? Is there any suggestion that the period may be reduced?

Mr. C. A. Pitts: We have no reliable information. We have only personal experience. Generally it takes a fair time. We cannot really answer the question adequately.

Shri V. M. Chordia: You must have studied the present Bill. In that some new provisions have been added about the period from the date of application to the date of sealing. Should there be any amendment, in your opinion, to this section, so that the time may be reduced?

Mr. C. A. Pitts: It has been suggested that if it is India's wish to remain in harmony with the majority of the developed countries the simplest thing would be to conform with the convention, whatever it may be, whether it is the date of application or it is the date of sealing, established by other countries. The intention ought to be to reduce the time between application and sealing as much as possible.

Shri R. Ramanathan Chettiar: During the course of your evidence you prefaced your remarks saying that the Associated Chamber of Commerce and Industry represent Indian-based industries. May I, in all humility, ask you what you mean by Indian-based industries?

Mr. C. A. Pitts: I mentioned in fact, Indian companies owned entirely by Indian shareholders with no foreign connections at all.

Shri R. Ramanathan Chettiar: The 2500 companies which you mentioned mostly represent foreign and, particularly, British interests.

Mr. C. A. Pitts: No, Sir, there is a strong element wholly of Indian business interests also.

Mr. A. B. Parikh: There are a large number of members of the Bombay Chamber of Commerce who are purely Indian-owned companies. Many of the companies of the Tata group and the Mahindra group are members of the Bombay Chamber of Commerce and they are also members of the Associated Chamber of Commerce. A large number of other companies which are not members of one group or the other are also members. So there are a number of companies that are not in the sense in which you use the term "anything but Indian-based". They are entirely Indian-based. I represent Voltas. Although we have non-Indian interests owning a certain part of the capital, that is only a very minor part.

Shri R. Ramanathan Chettiar: In your Memorandum you have almost indicated that you are not very much in favour of this legislation.

Mr. C. A. Pitts: We have said that the existing legislation has worked well and that the particular needs of the Government to ensure that certain products and processes are quickly made available to the Indian public and Indian economy can be taken care of by suitable modifications to the compulsory licensing system. In our view some of the other new clauses are not necessary.

Shri R. Ramanathan Chettiar: Are you aware that in UK it is more

rigorous than what is contemplated in our Bill?

Mr. C. A. Pitts: I think that is a matter of judgement. My sphere of responsibility is in India. I am not an authority on the British Patent Law. But I would not accept your fundamental assertion that the British law is much more rigorous. That is a matter of debate.

Shri R. Ramanathan Chettiar: You are not in favour of this provision relating to compulsory licence?

Mr. C. A. Pitts: I am in favour of compulsory licensing. I think it is a very necessary provision. I am not in favour of the so-called automatic licensing of rights.

Shri B. K. Das: Are you aware that several countries have got process patents only and not product patents?

Mr. C. A. Pitts: I think this question was raised previously that some countries have product patents, some have process patents and some have a combination of both.

Shri B. K. Das: We have introduced this with a view to encouraging research in our country. What have you to say about that?

Mr. C. A. Pitts: In the chemical industry proper, so to speak, the question of process patent is perfectly satisfactory. I am not an authority on this, but I believe that arguments in respect of other types of activity lay more emphasis on the product made.

Shri B. K. Das: For pharmaceutical industry you agree that this will be all right?

Mr. I. Mackinnon: So far a pharmaceutical industry, in particular, is concerned, I think that there can be no doubt that the protection granted by a product patent is far greater than that granted by a process patent. In many cases it is the product that matters and not the method of making it. The real invention consists of finding a drug for a particular thing in the human body, and how that drug is made is entirely a different matter. Its manufacture may be very simple and finding a substitute method of manufacture may also be a very simple process. But the process of discovery by testing the diverse compounds and the eventual discovery that this chemical compound will produce some dramatic results in a particular disease may be a very long and extremely costly process, both in the chemical laboratories, in the bio-chemical laboratories, in the testing of animals and human beings and all other kinds of testing that has to be done before a new product is put on the market. Therefore, the average drug manufacturer would ensure that his product is protected once he has discovered and proved by means of testing that it is safe and effective, rather than, having gone through all that and put the product on the market have someone else come along and make it by a relatively simple process and take away from him all possibilities he had of recouping his expenses. Nevertheless, I think it is fair to say that, speaking personally, and speaking for the Chamber and speaking for OPPI, and they will do it in a day or two, if for general reasons it were the decision of this Committee to retain the provision for a process patent only and not a product patent, there must be at least some provision that the burden of proof is on the infringer to show that the product is not made by the patented process. The burden should not be on the patent-holder to show that the infringer is using his process. The burden should be on the other party to show that they are not using the patented process. With that provision, the clause relating to process patent will have far less damaging effect on patents and research in general than the provision in its present form.

Shri B. K. Das: In some cases we have seen that the patentee takes patent for several processes but he exploits only one of them. Because of this, others are precluded from going in for other processes. Should this not be stopped?

Mr. I. Mackinnon: The reason is the one which I just gave. After spending a lot of money in the discovery and testing of the compounds and establishing that this is a useful drug, the manufacturer is not willing to see that his investment is dissipated by somebody else makng it by some other process. Therefore, he attempts to protect himself against this by patenting all known processes for arriving at this product. I would submit that this happens only in some cases. It is not a very common thing to happen. It is a rare instance where a drug has taken a long time to develop and its chemical structure is extremely simple so that it can be manufactured by another relatively simply process. Since it is not a very common occurrence, I think we should not call this a very serious risk.

Shri B. K. Das: Suppose there is a provision that the burden of proof that a drug is manufactured by a process other than the patented process is on the infringer, then that would be sufficient?

Mr. I Mackinnon: I think it would take care of most of the problems.

Shri Kashi Ram Gupta: The present Bill gives 14 years period from the date of completion of the specification while the former Act gives 16 years from the date of application. The time taken from the date of application to the date of completion of the specification may be 1 to 1½ years. As such, there is not much difference between the present Bill and the old Act, so far as this side of the patent is concerned. What is your opinion about this?

Mr. C. A. Pitts: Yes, Sir. The difference between 14 and 16 is, of course, not very great. The power to extend, I think, has disappeared altogether which, it seemed to us, might have been just and useful in certain circumstances. The impairment of confidence has been, so to speak, the application of this curtailment retrospectively to existing patents. The other point we were making was, as India is emerging as a more fully developed figure on the international scene, both in terms of trade and industry, it would pay India to stay instead with the majority of countries in their general patent legislation. If, for example, the convention was 15 years from the date of sealing, that would be a sensible thing to do. If it is 16 years from the date of application, it would be sensible to follow it. But the difference between 14 and 16 is not significant.

Shri Kashi Ram Gupta: May I draw your attention to page 49 of the Model Law for Developing Countries in which it is stated that the minimum period can be 10 years from the date of grant of patent?

Mr. C. A. Pitts: Well, I have no comments on that.

Shri Kashi Ram Gupta: So far as 14 years from the date of specification and 16 years from the date of application are concerned, you have no grounds to differ?

Mr. C. A. Pitts: I do not think the point is very material.

Shri Kashi Ram Gupta: You have laid stress that we should go on the lines of other countries. The model law points out two kinds of patents—from the date of application or completion of specification and the other from the date of grant of patent. Which do you prefer?

Mr. C. A. Pitts: If the gap between applying and sealing is not very large, I would suggest that the point is immaterial. The Indian law

should lie alongside the laws of the major countries with whom she does trade in patented goods and technical information. I do not think it is particularly significant which one you choose because it means the same.

Shri Kashi Ram Gupta: What is the time taken in India between the date of application and the date of grant of patent?

Mr. I. Mackinnon: I am afraid, I do not wish to answer about the actual fact at the moment. But what I wish to say is, and it seems relevant, since no patents have been sealed in some fields for quite a long period of time, whatever the period has been between the date of application and date of sealing in the past, it is bound to be a great deal longer in the future until the backlog has been caught up, and I hope that the Members will take that into account in deciding what the period is likely to be.

Shri Kashi Ram Gupta: You have mentioned that 2 per cent of the output is spent on research. May I know whether this is spent on applied and product research or on basic research also?

Mr. C. A. Pitts: I think the reply that we gave was a very limited one based on limited experience. I would submit that a more detailed reply could be given after full investigation. It will not be a reliable answer to say off the cuffs, so to speak, how much is true research and how much is applied research and how much is development.

Shri Kashi Ram Gupta: My point is whether basic research has been started by these industries.

Mr. C. A. Pitts: Basic research has been started certainly in the chemical industry.

Shri Kashi Ram Gupta: In the pharmaceutical industry also?

Mr. C. A. Pitts: Yes.

Shri Kashi Ram Gupta: Which are the main companies that have started it excepting the CIBA?

Mr. C. A. Pitts: My own company has started it recently. I am afraid I am not able to answer for all the members of the Associated Chambers.

Shri Kashi Ram Gupta: It has been given out that generally a medicine goes out of use within a period of 10 years. Do you agree with this?

Mr. I. Mackinnon: I am afraid I cannot subscribe to that view. There are many medicines in the market that are still having good value for the last 50 years. On the other hand, a medicine might go out of use within six months if somebody invents anything better. I do not think it is possible to give an average life of a medicine like that which will mean anything worthwhile.

Shri Kashi Ram Gupta: Are you aware of the fact that your own OPPI members have mentioned that in their memorandum?

Mr. C. A. Pitts: I don't know.

Shri Kashi Ram Gupta: If you read it, you will find it there.

Now, my last question is this. You have said that you will be able to have exports from this country if the present Bill is not put in its present form and that the old Act should be there. But at the same time, you say that the cost of production in India is very high as compared to that of other countries. How can it be possible to have exports from this country?

Mr. C. A. Pitts: I think it is a fact that exports are being made out of India at any price in order to earn foreign exchange. Export effort has, in fact, very little to do with the cost of production. Exports have been allowed at prices well below the cost of production.

Shri Kashi Ram Gupta: How can the patent law help in that?

Mr. C. A. Pitts: The point I was trying to make was that if you have a product which is patented, say, for 15 years in Britain and it is made in India outside of patent, then you would have difficulty in exporting that product to Britain. This was the argument for making the Indian patent law in step with that of other countries with whom she wishes to have the trade.

Shri K. K. Warior: You have made out a case for the manufacturers to protect their rights well. Then, there is the other side also, that is, the interest of the consumers. For instance, there is a product which is protected by the patent law. Now, there are new processes which are coming up in India. Why should you bar the consumers from having the cheaper products which can be manufactured here? It is the patent of the product which is coming in the way. How can the interests of the consumers be protected?

Mr. Chairman: He has answered about that.

Shri K. K. Warior: The new processes are coming up, as many as 10 or even 12.....

Mr. Chairman: They have answered that.

Mr. C. A. Pitts: We endorse the existence of the provisions of compulsory licensing. If there is a product or a process which is beneficial to the people of India and which is not being exploited by the owner, then it is right and proper that a compulsory licensing should be resorted to to compel production of that product.

Shri K. K. Warior: There is the compulsory licensing provision. But at the same time there are so many litigations going on. When a new process is put into manufacture, that is barred by the court. Now, so many litigation cases are coming up even though the provision of compulsory licensing is there. How to avoid all this?

Mr. C. A. Pitts: I think that is a fact. The provision of compulsory licensing seems to be little used.

Shri K. K. Warior: Then, you take exception to clause 48. But in the U.K. Act also there is such a provision under section 46 which allows use of patented inventions for the services of the Crown. It says:

> "Notwithstanding anything in this Act, any Government Department and any person authorised in writing by a Government Department may make use and exercise any patented invention for the services of the Crown in accordance with the following provisions of this Section."

What is the difference that you make out?

Mr. I. Mackinnon: As I understand it, the U.K. Act deals specifically with the use for the purpose of the Crown. This clause does not restrict it for the use of the Government.

Mr. Chairman: That is specified there.

Mr. I Mackinnon: It is not specified in this particular clause. The clause, as it is, is unlimited.

Mr. Chairman: You may please see Section 102 read with Section 48.

Mr. I. Mackinnon: There is no limitation in clause 48. Clause 48 is very much wider. May I also point out that the U.K. Act provides for compensation to the patent-holder.

Mr. Chairman: It is provided:

> "(b) the importation by or on behalf of the Government of any patented medicine or drug for the purpose merely of its own

use or for distribution in any dispensary, hospital or other medical institution maintained by or on behalf of the Government or any other dispensary, hospital or other medical institution which may be specified by the Central Government in this behalf...."

Mr. I. Mackinnon: It says, any dispensary, hospital and all that.

Shri K. K. Warior: The U.K. Act actually takes more powers than what is provided in this clause. Sub-section (6) of Section 46 of the U.K. Act says:

"For the purposes of this and the next following Section, any use of an invention for the supply to the Government of any country outside the United Kingdom in pursuance of any agreement or arrangement between His Majesty's Government in the United Kingdom and the Government of that country, of articles required for the defence of that country shall be deemed to be a use of the invention for the services of the Crown; and the power of a Government Department or a person authorised by a Government Department under this section, to make, us and exercise an invention shall included power to sell such articles to the Government of any country in pursuance of any such agreement or arrangement as aforesaid....."

Mr. I. Mackinnon: It is a matter of interpretation whether it is wide or not. My impression is that the U.K. Act specifies clearly whereas Clause 48 of the present Bill does not specify clearly.

Mr. Chairman: I read Clause 48.

Mr. I. Mackinnon: That seems to be much wider in its possible application than the U.K. Act.

Mr. C. A. Pitts: It is not that we are defending the British Act.

Mr. Chairman: U.K. is a highly advanced country and what is good for U.K. should be good to us also.

Shri R. Ramanathan Chettiar: The 1911 Act is based on the Act of U.K. Mr. Mackinnon has said that the U.K. Act is more specific whereas the provisions in the Indian Bill, Clause 48, are wider. May I point out to Mr. Mackinnon one sentence which specifically states that "the Government of U.K. can sell to any government or any country". That is not found in our Bill.

Mr. I. Mackinnon: Under a specific treaty obligation.

Mr. Chairman: I may tell you that all clauses beyond 102 are copies of the U.K. Act. There is nothing new.

Shri M. R. Shervani: In the U.K. Act, is compensation provided or not?

Mr. Chairman: The power is there. But we have not provided compensation.

Shri K. V. Venkatachalam: I want to ask you a question in the pharmaceutical field. It has been represented before us by other witnesses that the development in the pharmaceutical industry such as has been during the last five or six years has been mainly in production in the penultimate stage, *i.e.*, just in the formulation or just one or two steps lower than the final product. Can you give your assessment of this situation?

Mr. C. A. Pitts: This, in fact, must be so in a country which has before it the long road towards industrial self sufficiency. Some of the intermediates required in the chemical and pharmaceutical industries are

highly sophisticated to go back to the root raw material and to do it on a small scale would make costs prohibitive. Therefore, the general pattern in the sophisticated industries is to start near the end product and gradually go back towards the root raw material. One of the disappointing things in India has been the somewhat slow development of the organic chemical industry—we do not want to discuss the reasons for that here—and it has slowed down the speed with which the pharmaceutical manufacturers can proceed backwards to the root material.

Shri K. V. Venkatachalam: Will it take too long to go forward in a significant way?

Mr. C. A. Pitts: Much depends on the government policy; for example, the speed with which the Hindustan organic project gets off the ground; this is going to manufacture some of the basic organic intermediates.

Mr. Chairman: You told us that the Government has made a difference in respect of the term of the patent, between pharmaceutical drugs and other inventions, namely, 10 years and 14 years. Many countries have made this difference especially the countries which are developing fast technologically like the United States, Canada, New Zealand and South Africa. They have set up special committees and they are making this difference. Canda suggested abolition of drug patents. In the United States it was contended that three years would be an ample period to recover research outlays and then there is the maximum royalty of 8 per cent for unrestricted licence; that includes grant of all technical information required in sale and manufacture. The Simon Committee in South Africa suggested five years for drug patents. This is the case in advanced countries. Why should you then object if the Government of India make this difference between pharmaceutical and other inventions.

Mr. C. A. Pitts: Those people whose responsibility it is to govern the country should be conscious of the need for drugs to be made available as quickly as possible and at as low a price as possible to the people of that country. It is really a question of finding what is, so to speak, the right compromise. One should consider the various aspects. The drug manufacturers should not, in fact, be terribly so rushing with their development that they would put a drug on the market before they are absolutely sure that it is safe. Also if the procedure which will cause seven years to elapse before a drug really comes to be commercially exploited is accepted, he will have only three years left to get his money back and prices would be extremely high. This will not be beneficial to the consumer.

Mr. Chairman: I want to read out a quotation from "Amendment of British Patent Law" by the Chartered Institute of Patent Agents:

"Nevertheless, the possibility may be conceived of a new food, medicine or device, being of such vital importance to public health that there should be as little delay as possible in meeting every demand for it. This could be covered if Section 41 were repealed, by providing in Section 37, as suggested by the Institute to the Swan Committee, that an application for a compulsory licence under a patent for such a product could be made at any time after the grant of a patent, and would be granted before the expiry of the three years if, but only if, overwhelming public interest were proved."

In cases of emergencies like an epidemic when the demands of the public are not met, why should not the Government have the powers to see that the necessary drug is supplied to the people of India at a reasonable price?

Mr. C. A. Pitts: Such a situation could be taken care of by a modifi-

cation of the compulsory licensing provisions.

Where the product is of such vital importance to the country, then some provision could be laid down that, subject to there being satisfactory evidence, a compulsory licence could be issued. This, I think, is a reasonable proposition.

Mr. Chairman: Do you think that the Patent Controller will issue licences of right?

Mr. I. Mackinnon: Licence of right is not issued by the Controller. Licence of right is applied for to the patent holder by the applicant and all that the Controller is to do is to settle the terms.

Mr. C. A. Pitts: Compulsory licensing provisions could be modified to provide for such situations without introducing the complications of licence of right.

Mr. Chairman: It is only to meet such situations that licence of right is included.

Mr. C. A. Pitts: Automatic licence of right would not bring in compensation.

Mr. Chairman: We will certainly expect the Controller of Patents to go into it. He has got the knowhow and wherewithal.

Mr. C. A. Pitts: In the Bill it is not left with the Controller. Anyone can have a licence of right. Controller is only to settle the terms and disputes. The better devise would be to modify compulsory licence provision wherein the Central Government can take initiative.

Shri M. R. Shervani: Controller comes in to settle the terms and it is for the controller to say that this firm is not qualified or impose suitable terms.

Shri C. A. Pitts: Under the Bill anyone can have such a licence. If the terms are in dispute it is for the Controller to settle them.

Shri M. R. Shervani: We want to know from the officers concerned if what Mr. Pitts said is the correct position.

Mr. Chairman: We will find out.

Shri C. A. Pitts: May I read clause 88 of the Bill?

Where a patent has been endorsed with the words "Licences of right", any person who is interested in working the patented invention in India may require the patentee to grant him a licence for the purpose on such terms as may be mutually agreed upon.

Shri R. Ramanathan Chettiar: You know the prices of life-saving drugs in this country are very high compared to the prices charged in other countries. Here I would like to elaborate on one point. A few years ago Haffkin Institute of Bombay made some research and brought out Tolbutamide at one-fourth of the price charged by Hoecht. Hoecht people objected to Haffkin doing it and now the matter is before the Court. The object of the Bill is to bring down the cost of life-saving drugs. But, we are prevented from doing this and that is why this provision is also put in here. Are you in agreement with us that we should bring down the price of life-saving drugs in this country?

Mr. C. A. Pitts: Indeed.

Shri R. Ramanathan Chettiar: But the Hoecht people prevented Haffkin Institute from doing it.

Shri C. A. Pitts: By a process which Hoecht has patented and on which Hoecht has spent a lot of money, Anyway, the matter is

sub-judice and it is not therefore a subject on which I should comment at all.

Mr. Chairman: Thank you.

(The witnesses then withdrew).

III Bengal Chemists and Druggists Association, Calcutta.

Spokesmen:

1. Shri P. K. Guha
2. Shri T. K. Ghosh

(The witnesses were called in and they took their seats)

Mr. Chairman: We have received your memorandum. Whatever evidence you give here will be printed, published and distributed to Members and laid on the Table of the House. Even if you want any portion to be confidential, it will be printed and distributed to members. Your memorandum has been circulated. If you want to add anything more to it or stress any particular point, you can do so. After that, members will put question which you may answer.

Shri P. K. Guha: If anything crops up in the course of discussion, we will explain it. Otherwise, we will more or less limit our submission to the memorandum.

Shri V. M. Chordia: You are in favour of abrogating the present law?

Shri P. K. Guha: Yes.

Shri V. M. Chordia: How do you suggest that the person should get incentive for research?

Shri P. K. Guha: What research—basic research?

Shri V. M. Chordia: Basic research and other researches. If you have different opinions on different types of research, please give them.

Shri P. K. Guha: We submit that everywhere in the world basic research are mainly sponsored by Government. But, as far as we, in India, are concerned, we have not so far contributed anything in the basic research. What we understand here is the commercial research. This is also called development research and if any incentive is to be given, that should not be on the basis of development research. Our submissions therefore are that it should be on the basis of basic endeavour. There should be zeal and initiative amongst the industrialists in India and no patent protection is necessary in the development of such zeal. We do not feel that any protection is necessary to give an incentive for development of the results of basic research.

Shri V. M. Chordia: Don't you agree to this that if a person starts from the begining, after five years or ten years' experiment only, he gets a product. Whereas another person who sees the product, just imitates it. He has no work but has simply to imitate that. In that case, should not the person who has spent five years or so on this also get some protection?

Shri P. K. Guha: As far as pharmaceutical industry is concerned, development research is carried out from the point of applied research and basic research. That is the point to be thought of. As far as pharmaceutical industry is concerned, in our country, if it makes any improvement, that is from nucleus of basic research or applied research. If you think of protection to be given to somebody who is carrying out basic research, we don't mind for that. If protection is to be given to a person who has invented something from the organic stage, that is quite different. Take for example Penicillin. The organic compound came out from Alexander Fleming. If he is claiming the patent for it, you better think over the matter.

Shri K. K. Warior: We find that even among the pharmaceutical industries, some are now having new processes from out of lapsed ones. Should we not think that some protection should be given to the new processes which are giving to the consumers such materials at lesser prices?

Shri P. K. Guha: Is it a question of process for rivalry?

Shri K. K. Warior: I shall give you a concrete instance. Take for exaample the most commonly used aspirin. A new process has been found out by somebody. That gives cheap material and cheaper aspirin to the consumers. Don't you think that that must be protected by a patent?

Shri P. K. Guha: Certainly not. First of all, the original process of aspirin invented by Bayers is also covering several processes and there is improvement on them. It is an improvement in the technology and the method of production. If the Patent Law is contemplated, I don't think that it will also give protection to the technological improvement made. As far as full specification is concerned, technology helps. How such an improvement for increasing the production can be covered by protection depends on how much an industrialist can produce that. If there is a larger production, it will be cheaper in the market. This is my contention.

Shri K. K. Warior: At present our chemical industries are just starting and we visualise that this industry will develop very soon. There are many possibilities for our scientists and technologists to introduce very many new things, new formulae and new compounds and new production. Now, don't you think that some encouragement should be given to those people in the form of protection which will give them some incentives also?

Shri P. K. Guha: What I want to submit is this. Right from the start of the independence, our pharmaceutical industry produced goods worth Rs. 12 crores. Now we are in the stage of producing Rs. 175 crores worth of stores. If that is so, let us have a test. We have given the opportunities of exclusive patents since 1911 and we have given the opportunities after that also with certain amendments. Anybody can go to the Patent Controller and say that this has not been exploited in full and that we can improve upon it. The patentee is not taking enough steps to produce in full and according to our necessities. We have certain provisions in the existing law. These served no remedy. If we want that our research workers, chemists and scientists should be given the protection, well, it is worthwhile to think over it. But, my submission is that we should try to do it on the basis of a test of going without patents for a couple of years. So far, we do not have any papers where we can see that a large number of inventions have come out from our research workers or scientists. Scope has got to be improved.

Shri K. K. Warior: In view of development of Petro-chemicals, new petrochemical complexes are coming in. There are so many of them. Don't you think that this will give sufficient scope for our research scientists also to make new inventions and should not that invention be protected from the encroachments of foreigners who still exploit that? There are so many instances like that. Take for example Suri gadgets. Should that not be protected by patent law?

Shri P. K. Guha: Protection should be at the basic stage. If it is from the basic stage, we don't object. That is what we envisage.

Shri K. K. Warior: What do you mean by basic research? Take the concrete instance of Suri gadgets. Wherefrom is the basis taken? Gad-

get is already there; he has made new inventions but the West German people are exploiting that. Where does the basic thing begin?

Shri P. K. Guha: I quite understand that the West Germans are exploiting it. Whether it is our people or anybody else, it is the interests of the consumers, that is to be seen and we can understand the feeling of the consumers too.

Mr. Chairman: How are you going to protect the Indian scientists who have found out the method of manufacturing a new drug?

Shri P. K. Guha: I submit that as far as pharmaceutical industry is concerned, new invention is necessary. At the same time, there should be market for its utility in our country.

Mr. Chairman: It is not a question of finding a market. Here, how are you going to protect the improvement made by a scientist by his labour? Unless there is a patent, any man can come and exploit that process.

Shri P. K. Guha: If there is a competitor we should not have any objection. However, somebody has come with a research, with a new invention and simultaneously there is another one from the foreigners....

Mr. Chairman: You have not understood me. You perfect a process for the manufacture of a drug. You do not want any patent on it. Suppose I come and exploit that and begin to manufacture that drug and earn money. How are you going to protect your interest? You have no objection to it.

Shri P. K. Guha: I have no objection there. I tell you our intention is to reduce the prices, in the interests of the consumer. The protection is already there and we have seen the results of that protection. We feel that we are exploited too much.

Mr. Chairman: So you do not want any patent.

Shri K. V. Venkataehalam: What is the total membership of the Bengal Chemists and Drugists Association?

Shri P. K. Guha: About 1500.

Shri K. V. Venkatachalam: Who are they?

Shri P. K. Guha: We have manufacturers; we have wholesale and retail chemists.

Mr. Chairman: Are there any manufacturers also in your Association?

Shri P. K. Guha: Yes, there are 5.

Shri K. V. Venkatachalam: Against a total membership of?

Shri P. K. Guha: About 1500.

Mr. Chairman: Which are these five firms?

Shri P. K. Guha: Bengal Chemicals, Bengal Immunity, Dey's Medical Stores....

Mr. Chairman: The views that you have put forward before us represent the views of these firms—Bengal Chemicals, Bengal Immunity etc?

Shri P. K. Guha: These are the views of our Association.

Mr. Chairman: Do these five drug manufacturers agree with your views?

Shri P. K. Guha: Individually we have not taken the views but this memorandum was circulated to our members and if they had any objection, they would have intimated to us.

Shri K. V. Venkatachalam: You have been overwhelmingly representing the traders?

Shri P. K. Guha: Yes.

Mr. Chairman: All these five are pharmaceutical industries?

Shri P. K. Guha: Yes.

Mr. Chairman: Which are the two others?

Shri P. K. Guha: The other two are—EIP Pharmaceuticals which you very kindly visited and another is Dolphin Laboratories.

Mr. Chairman: Thank you very much.

(The witnesses then withdrew).

(The Committee then adjourned)

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965.

Wednesday, the 13th July, 1966 at 09.30 hours.

WITNESSES EXAMINED

I. Shri T. Durairajan, Dollar Company, Madras.

II. Pharmaceutical Manufacturers' Organisation, Ahmedabad.

Spokesmen:

1. Shri Hasmukhlal C. Shah.
2. Shri I. A. Modi.

III. Gujarat Vepari Mahamandal, Ahmedabad.

Spokesmen:

1. Shri Charandas Haridass, *Vice-President.*
2. Shri Chandulal Premchand, *Ex-President.*
3. Shri J. T. Trivedi.

1. Shri T. Durairajan, The Dollar Company, Madras.

(The witness was called in and he took his seat).

Mr. Chairman: The evidence given by you is public and will be published and laid on the Table of the House. Even if you want any portion of it to be confidential, that also will be printed and distributed to Members of Parliament. **We have** received yo' memorandum. It has been circulated to all the members. If you want to add any new points or stress anything, you may do so. After that, members will ask you questions.

Shri T. Durairajan: The first question is whether patent protection of drugs is necessary on human grounds, because whatever protection is given, it is only with regard to having a monopoly with regard to the price structure. In a country like ours where economic standards are so low, can we really afford the prices fixed by firms who patent the drugs? Very often we are told that large sums of money are being spent on research. This expenditure is being written off, so that actually the Government contributes a major portion of the research expenditure. The only thing is part of it might be given as dividend to shareholders and that amount comes from people who have invested the capital. Even in regard to items where no patents are involved, the manufacturers have a research department to find out economic ways of manufacturing the products.

The tetracycline patent expired in U.K. recently. The ICI immediately announced that they are making arrangements to manufacture the drug in U.K. and to sell it at a price much lower than the price at which Pfizers were selling it before. Pfizers filed a suit in the House of Lords for patent infringement, but it was decided against Pfizers. The question of royalty to be paid is still not settled. I just mentioned this to show how after the patent expired, a private firm has come forward to manufacture it at a lower price.

I have made a survey of prices of patented drugs in the past ten years Only when these drugs started coming from Italy or other rupee-payment countries that the firms holding patents in India started reducing the prices. They did not do it on their own although they have been able to recover more than what they had spent. Only when there is competition, they agree to lower the prices. Vitamin B-12 is an example.

We are told that patents will stimulate transfer of technology. Is it so? In India factories are ste up on turn-key basis and everything is brought from outside. If something goes wrong or if the factory is blown up, I do not think the Indian scientific personnel in charge of the factory would be able to erect it again and start production.

There is provision for compulsory licensing. The firm holding patents might allow one or two other firms to manufacture the product by agreement and still keep up the price. There may not be any need for compulsory licence or for the Controller even to consider the application. Perhaps a provision can be made in the Bill that if the patentee works the patent to the detriment of the country, Government will immediately take action in the interests of the country. The other thing is compulsory licensing without technical know-how. What is given in the patent specification is just a basic structure. With the patent specification alone I am not sure whether it will be possible to manufacture the product. The question is whether we can compel a patentee to give the know-how. Unless the know-how blueprints or drawings are given, I do not think it will be possible to manufacture the product in the country.

The amount spent on medical propaganda is much more than what is spent on research. Taking a country like ours, each individual firm spends, I think, Rs. 20 lakhs to Rs. 30 lakhs on medical representatives. A medical representative costs Rs. 10,000 to Rs. 15,000 per annum. Each firm has

200 to 300 medical representatives and they spend Rs. 20 lakhs to Rs. 30 lakhs on medical propaganda. I do not think a fraction of that amount is spent on research. Conversely, even if you take up a country like the United States of America. I think in the year that I am referring to, 450 million dollars were spent on medical propaganda and 400 million dollars on research. Therefore, the amount spent on medical propaganda to popularise drugs in the medical profession is perhaps much more than what they are spending on research.

Since submitting my memorandum I had occasion to read the criticisms appearing in the Press with regard to this Patent Bill and I have had discussions with various persons who are interested in manufacture. What these firms are concerned, in my opinion, is not as to how it will affect their business in India. What they fear is, under-developed countries like Burma, Ceylon, Malaya and the middle-east African countries, who may not acknowledge us as their political Guru, once they find that this Patent Bill is passed by us, they will immediately bring in a similar legislation in their countries. What they are afraid of is, therefore the amount of money they are now able to receive from these countries by way of exports would perhaps come down. That is one of the reasons why this Bill is being opposed.

Mr. Chairman: May I take it that you are in agreement with the provisions of this Bill?

Shri T. Durairajan: Yes.

Shri R. P. Sinha: May we know something about the witness, what is this Dollar Company etc.?

Shri T. Durairajan: Dollar Company is a partnership form consisting of myself and my younger brother. We have been importing drugs in bulk and selling them either to the Government or to wholesalers in India during the past two decades. From 1960 onwards we are manufacturing a product called Hedensa, a medicine for piles. It is a German product, formulated by a pharmacist who is still alive. It has been exported from Berlin for the past 50 years. Because of import restrictions the Dollar Company has acquired the trade mark rights for it just as we buy ownership of flats. The Dollar Company owns the trade mark in India for Hedensa and also Lichensa of an identical formula with a slight change used for skin troubles and sold all over India. The total requirements of the country can be met with thirty working days of our factory. Therefore, in order to keep the staff employed we are making tablets and selling them mainly to the Government or to the army.

Dr. C. B. Singh: This memorandum is well documented. It has been guided by the one main principle which speaks about your own background. The two basic facts which have brought about this memorandum are: the price part of these drugs in the country and the cases which have been going on for infringement of patent rights. You have mentioned about Kefauver Committee report. Senator Kefauver was of the opinion that patents were primarily responsible for high costs of drugs. Do you know what was the result or the ultimate end of that report? What happened in U.S.A. Parliament after this report?

Shri T. Durairajan: I do not know what was the result. The Patent Act is still there in the United States.

Dr. C. B. Singh: The result was two very modifications to the Patent Act.Senator Roman Hux, a member of the sub-committee said: "It has been my judgment that the hearing so far has been prejudiced and distorted, they have lacked balance, they are unfair to the industry and to the Government agency, the Senate itself and to the public". This report has gone on in this country. People have taken one part from there and one part from here and given a distorted

picture of the whole thing. This report has been responsible for a lot of misunderstanding.

You have mentioned that you are trying to give life-saving drugs at reasonable prices to the public. Don't you think that the Government has sufficient powers to regulate the prices, import any amount they want, cut down imports if necessary, cut down the percentage of foreign exchange and do anything they like to regulate the prices? If even with all that the prices have not come down, it is not the fault of the patent, it may be that somebody in the Ministry is responsible for it. What have you to say about it?

Shri T. Durairajan: All that I would submit is that there is not that much coordination between the Patent Office and the Ministry. The Controller of Patents has very little to do with the prices. I do not know whether it will be possible every time for the Controller to examine the prices and then report to the Ministry.

Dr. C. B. Singh: You have been all the time importing raw materials, packing them and distributing them. Have you a research unit?

Shri T. Durairajan: No, not until today.

Dr. C. B. Singh: You will agree that with our mixed economy, where we want to compete in the world market, we have got to produce things of our own. Do you think that we still want to import things and not produce some of our own new drugs in this country?

Shri T. Durairajan: We have got to do it as early as possible, but the difficulty is that we are still not able to produce one basic drug in this country.

Dr. C. B. Singh: In your memorandum you have mentioned two important drugs. Do you know that Pimpri have asked for a royalty of 7½ per cent on one of their druge when our Bill provides only 4 per cent. Anyhow, that is besides the point. You agree that research is very important and hardly anything is being done in this country.

Shri T. Durairajan: That is correct.

Dr. C. B. Singh: We are doing something in the national laboratories, in the Central Drug Research Institute and in the universities. What should be done so that there will be more of research in this country?

Shri T. Durairajan: Until we are able to set up manufacturing units of our own, I do not think we can really make any progress with regard to research.

Dr. C. B. Singh: The CDRI, Lucknow has been functioning for the last 15 years and its annual budget is Rs. 30 lakhs. It has not been able to produce any good results so far. What is the reason?

Shri T. Durairajan: I am not competent to make any comments on an institution like that. Individual scientists should take personal interest in their work. Obviously, it is not a co-ordinated effort which they are making. That is my impression. I was there when Dr. Mukerji was there.

Dr. C. B. Singh: What improvements would you suggest in the set up or working there?

Shri T. Durairajan: Each individual scientist has to take personal interest in the work. I cannot suggest what each scientist should do to find out new drugs.

Dr. C. B. Singh: You are more or less against foreign capital in this country?

Shri T. Durairajan: I have not said that.

country. So. to the extent they are able to charge a higher price, they are able to receive the money in foreign exchange in their own country, which is advantageous to them, because it is free of Indian or Ceylonese income-tax. I may even add that they send them as consignments on account and invoice them after ascertaining the price which can be realised. If they find that a higher price can be realised, they will invoice at a higher price.

Shri Arjun Arora: Am I to understand that this country has to pay a higher price than the one prevailing in the country from which we are importing the drug?

Shri T. Durairajan: Not only higher than the price prevailing in the importing country but in some other countries also. Hong Kong has a free market. A firm in UK charges 15 shillings a kilo for a drug while selling to Hong Kong whereas we in India pay more than double that amount. So, a number of firms are importing drugs from Hong Kong at half the prices which the British manufacturers or their agents here are quoting.

Shri V. M. Chordia: What is the price of Hadensa in Germany and in India?

Shri T. Durairajan: The cost of manufacturing Hadensa in Germany is far lower than in India for two reasons. An empty tube in which Hadensa is packed costs me roughly Rs. 220 for 1,000 Tubes. When it is put in cardboard boxes, then packed in dealwood cases, and despatched from Calcutta to Madras, it costs me roughly 35 paise per each tube whereas the cost in Germany is 6 to 7 paise. The base Lanolin has to be imported from UK or Germany on which we have to pay import duty. The ingredients have to be imported. So, the actual cost to me at Madras is roughly Rs. 13 to 14 a dozen whereas the imported cost is Rs. 17 a dozen *c.i.f.* which includes freight, packing, customs duty and insurance. The retail price of Hadensa in Germany is roughly 3 marks; Rs. 3-4-0 at the old rate. It is sold at a retail price of Rs. 3-6-0. Our price is Rs. 32 a dozen, as against the manufacturers cost of Rs. 16 to 17 and our sale price covers the excise duty, sales tax, profit for the distributor and our own profit.

Shri V. M. Chordia: Since you have a long experience of importing drugs and selling them, why are you not doing basic research or manufacturing at least those products whose patents have expired?

Shri T. Durairajan: It requires a large amount of money and I am averse to borrowing money. I would like to do business with my own money. If I have to produce a basic drug it will cost me Rs. 10 lakhs to 15 lakhs. I do not have that amount, nor am I willing to go to a public institution for borrowing money.

Shri V. M. Chordia: Is it a fact that capital is shy in this industry because there is no attraction for people who do research and invent medicines as they do not get a proper return and so they are not attracted to doing basic research?

Shri T. Durairajan: There is no quick money in the pharmaceutical industry as in textiles or jute. It is a long-term process. Secondly, if I may say so, it is also not possible to have a profit for the person who manages the factory. I do not want to explain it further.

Shri V. M. Chordia: If the person who invests the money is guaranteed that he will at least be in a position to earn whatever he spends and, in addition to that, will be able to have some profit, will he be attracted or not? What changes, do you suggest, should be made in the Bill so that he would have that security and enough profit?

Shri T. Durairajan: I do not think we can make any provision in this

Bill to correct this which is a basic factor in this country.

Shri A. T. Sarma: Just now you have said that your firm does not carry out research work; at the same time, you informed us that your firm could invent at least two drugs which are popular in India and abroad.

Shri T. Durairajan: I am sorry; I think, I have been misunderstood. My firm has not at all invented this formula. This formula was originated by Richard Morsch, who is still alive. He is a pharmacist himself and he invented it in 1904. He has been selling these two drugs all over the world. My firm was importing and selling them. Because of import restrictions we were getting it in bulk and repacking the same. Then we have acquired the trade mark rights for India. We do not make payment for royalty. We manufacture the drug according to the formula given by that firm. We have not invented it and we do not want to take credit for something which we have not done.

Shri A. T. Sarma: You said that something should be reserved for advertisement and research. Do you reserve any amount out of your profits for research work?

Shri T. Durairajan: Unfortunately, I have not been wise. We are only two partners. My firm makes a profit of roughly Rs. 1,70,000 and I get Rs. 1 lakh out of which the exchequer takes away Rs. 60,000 to Rs. 62,000. What is left for me is hardly enough for my own personal requirements. I am thinking of bringing in other partners in due crourse when we might have a little more fluid position and might undertake research. Research requires large capital and we have not been able to make any provision for that.

Shri Bade: I want to bring to your notice one criticism or comment in the Financial Express and I want to know whether you agree with it. It says:

> "If it is New Delhi's hope that prices of drugs would come down because of the reduction in the validity period of the patent and because of the compulsory licence system, it might find itself disillutioned. It would have been better for the government to follow the example of U.K. and appoint a committee to go into the price system of her drugs."

In your memorandum you have said that the foreigners are exploiting India. Should we have some provision in this Bill or should we appoint some committee to consider it as UK has done?

Shri T. Durairajan: It is easy to make the law but the whole difficulty is how to administer it. All that we can do is to provide that if a patentee works the patent to the detriment of the country, the Government can take the power to revoke it. That is the best we can do; beyond that we cannot do anything. Unless there is co-ordination betwen the Controller of Patents in Calcutta who will not be able to know the difference between two drugs except on paper and the concerned Ministry which goes into it and grants the licence for its manufacture and a third ministry which controls the prices or drugs, how are we to carry on? After you have finished questioning me, I will make a suggestion regarding the lack of co-ordination between different Ministries which certainly is responsible for certain lacunae in the present system because of which a large amount of foreign exchange is being drained out of this country. As it is not related to patents I did not mention it in the beginning but because there are Members of Parliament present I will mention it at the end.

Shri Bade: The same question must that is why they have incorporated be in the mind of Government and

clause 95(3) about the import of a patented article subject to the condition mentioned in clause 86, namely, that the reasonable requirements of the public with respect to the patented invention have not been satisfied. What are reasonable requirements is also given in clause 97. If the foreign manufacturer has refused to import the article in sufficient number, the Government can give a compulsory licence and can also ask the importer or the manufacturer to fix the price according to the Government's wish. Is that not sufficient for controlling the prices of drugs?

Shri T. Durairajan: The control comes in at the earlier stage. After all, let us know how it works. The patent is granted and sealed on the day the patent is applied for. I do not think the patentee gives the Controller the details of prices. Thereafter the imports come in or the manufacture is going to be set up. Even today the Government is not able to say that a certain price is unreasonable because unless they have competitive prices, how can they say that it is unreasonable? Nowadays we are hearing about Sandoz having been able to make some progress about Glucosides from Podophyllum Roots for cancer. Suppose, they are able to isolate it and bring it in the market. It may be that they may charge Rs. 100 for a week's course. How can you say that it is unreasonable unless there is something to compare? Unless we have some means of comparing it, how are we to take action? The Government cannot act *suo motto*. The Government servant who has taken action will be blamed for it. The data must be available to him to enable him to take action. Where is the data going to come from? So, unless we say "If the patentee works the patent to the detriment of the country", which will enable us to act *suo motto*, where is the question of saying that Government can take action?

Shri Bade: Suppose Government gets quotations from Italy or from other countries....

Shri T. Durairajan: With due respect I will have to say that when you say 'Government', you have to talk in terms of officials in the Ministries, who have to take the initiative. How is the Government going to get quotations? It is not that Government get prices from every trader, or from all the manufacturers. Where is the data going to come from? Across the table I find the Drugs Controller for India sitting. Does he get prices from foreign manufacturers, from all countries, unless somebody goes and tells him?

Shri Bade: I want to put another question about royalty. You have said that it should 7-1/2 per cent instead of 4 per cent.

Shri T. Durairajan: I have said, "in cases where the Government considers it necessary".

Shri Bade: May I bring to your notice that even on 4 per cent, 50 per cent of the royalty is taken away as taxes?

Shri T. Durairajan: With due respect I would submit that this question of royalty will have very little bearing. I do not think that there are going to be many Indian firms which are going to apply for compulsory licences. It is going to be only on paper. It is going to be something like giving music to your daughter before marriage, once she gets married, she forgets the music.

Shri R. Ramanathan Chettiar: In the course of your reply you have stated that ten years could be there provided there is a provision for extension. Could you elucidate that point.

Shri T. Durairajan: If a patentee goes to the Controller and says, "I applied for the patent in 1962; now it is 1972, but I have not been able to get even one cent from this country; it is only now that this drug is getting popular; I would like to get a return" and if he is able to satisfy the Controller and the Controller is also satisfied, then the Controller can

certainly grant an extension. What is actually happening is this. The patentee sells the drug under a trade name. During the life of the patent, that trade name gets into the country. Even after the expiry of the patent, for the next 20 years or so, the patentee gets a return. I can quote a number of cases. Take, for example, sulphathiazole; we can buy 1,000 tablets for Rs. 15. Cibazol which is the Trade mark of a Swiss Firm sell the same at Rs. 60 per thousand. The patent has expired; that drug is no longer used in many countries, but in India the drug is sold at Rs. 60 per thousand and they have a large profit on that.

Shri R. Ramanathan Chettiar: Life saving drugs are sold at high prices in this country. The object of this Bill is also to curb that tendency. But you wanted a longer period for those patents. Don't you think that they will perpetuate their high price policy?

Mr. Chairman: He has already answered that point.

Shri R. Ramanathan Chettiar: He wanted a provision for extension.

Mr. Chairman: Ten plus four, fourteen years.

Shri R. Ramanathan Chettiar: You must have heard of the case of Tolbutamide that is going on between Hoechst and Haffkine Institute.

Shri T. Durairajan: Yes.

Shri R. Ramanathan Chettiar: The Haffkine Institute has been able to produce through a process at a price one-fourth of what Hoechst has been able to do. But unfortunately it is held up because this matter is hanging fire in the High Court of Maharashtra. If you want to extend the period, then such things will prolong.

Shri T. Durairajan: No, that can be covered if this Bill is passed and the Central Government authorise somebody to import Tolbutamide and still pay royalty. I think this Bill has got the provision for that.

Shri B. K. Das: We have got provisions for compulsory licensing and licences of right. You feel that unless there is transfer of know-how, those provisions will not be of much help. Am I correct?

Shri T. Durairajan: Yes; you are perfectly correct. That is marriage without consummation. Unless there is know-how, how is the person going to manufacture this drug?

Shri B. K. Das: Do you think that there should be some provision in our Bill so that they are compelled to transfer the know-how?

Shri T. Durairajan: Unless there is a provision in the Bill, we cannot compel them. I will give an example. It is not that I am a scientist. Take for instance a vessel, which is rubber-lined, of a particular thickness. If the chemical is treated at a particular temperature, you get that end product. If that is not done, the end product would be different. Unless you can produce that end product which conforms to all standards of the original product, there is very little purpose in attempting to make the same. Take for instance a factory that has been set up by a foreign firm in this country. If that factory is blown up today, the Indian scientists working there will not be able to replace the factory tomorrow unless we get the same technicians to draw the blue print and drawings and have the factory erected.

Mr. Chairman: How can you compel anybody to part with his know-how?

Shri K. K. Warior: What is the *modus operandi* for that?

Mr. Chairman: How can we compel a patentee to part with his know-how?

Shri T. Durairajan: A provision can be made in the Bill that unless the Indian party is able to make the end product, he will not get the royalty.

Shri B. K. Das: That means you say that till then, he will have to wait for his royalty. Is it your idea?

Shri T. Durairajan: Yes. The foreign man is also interested in getting the money out of this country.

Shri B. K. Das: Supposing the provision is there. The apprehension is that, in spite of that provision, he may not transfer the know-how. Can we have another arrangement with the patentee for transfer of know-how...

Shri T. Durairajan: It can take the form of royalty in a lump sum. That is what is happening in other countries. They are purchasing the know-how by lumpsum payment.

Shri B. K. Das: Should there be any provision in the Bill or it can be done by arrangement?

Shri T. Durairajan: It can be done both ways. But, in my opinion, if the Government brings in a provision, all these firms will certainly respect it. I am sure in my mind that these firms do respect the sentiments expressed in the Bill. If there is a provision in the Bill, it will certainly enable the Indian entrepreneur to discuss with them and probably get better terms than what they would get if the provision is not there.

Shri B. K. Das: It will have some effect.

Shri T. Durairajan: It will have a large salutary effect.

Mr. Chairman: Has any country got any such provision?

Shri T. Durairajan: Not to my knowledge. The difference is this. In most of the countries, their scientific research is so advanced. I shall give an example. I am a musician and if another musician comes to me, he will certainly sing before me to exhibit his talents; if, however, I know very little about music, he will not sing before me. Likewise, with countries which are so advanced in scientific research, they are willing to come and discuss.

Shri B. K. Das: That is why wou want the quantum of royalty to be enhanced?

Shri T. Durairajan: Yes; it is only for that purpose.

Shri B. K. Das: You have suggested 71½ per cent.

Shri T. Durairajan: 4 per cent will not be adequate because whatever royalty we pay is subject to Indian Income-tax.

Shri V. B. Gandhi: You have said that prices of medicines which were patented remained at a higher rate even after the expiry of patent and you quoted the instance of Sulphathiazol. But don't you think that these high prices are also the result of the people's faith in the quality and people's confidence in the quality of the manufacturers's product? For instance, you are manufacturing a product and if people have great confidence in the quality of your product they will be prepared to pay a higher price than they would for any other ordinary cure.

Shri T. Durairajan: I agree with you. But what I had in mind was that even after the expiry of the patent, Doctors are persuaded to write down the product under the trade name, and not under the generic name, which is responsible for these high prices.

Sardar Daljit Singh: In your memorandum you have said that 90 per cent of the Patents in the field of drug and medicine in our country are held by foreigners. I want to know how many of them are in use and how many of them are not in use.

Shri T. Durairajan: I am sorry, I am not able to give an answer. I have not gone into that question.

Sardar Daljit Singh: You have mentioned that Indian companies imported some drugs from foreign countries and sold at high rates. Contrary to that, here is the instance of foreign firm selling at Rs. 187 for 1,000 tablets of Tolbutamide and the Indian firm, which purchases it from the foreign firm, selling it at Rs. 40 for 1,000 tablets. In the face of this, how could you say that Indian firms are charging higher rates and foreign firms are charging low rates? There are other patents also which are sold at high rates, but in India they are not allowed to manufacture. The instance is the case of Haffkin Institute of Bombay. What is your opinion—is Indian patent cheaper or foreign patent cheaper?

Shri T. Durairajan: The price of Rs. 180 that you mentioned is for the Rastinon brand of Tolbutamide. It is a product of the Frankfurt firm of Hoechst. If an Indian firm imports it from Italy and tablets it they will be able to sell it at Rs. 40. That is the difference.

Shri Bibhuti Mishra: On page 4 of your memorandum you have said as follows:

> I would also submit that we have to consider the various clauses in the Bill, from conditions existing in India, and not with those in advanced countries, especially in view of the present acute foreign exchange position, which I am afraid will continue for the next 5 to 10 years.

What is your suggestion to help India get out of this situation?

Shri T. Durairajan: The only remedy is to get liberal foreign exchange import.

Shri Bibhuti Mishra: At the end of page 4 you have said:

> Although under the provisions of this Bill, the authorities do not have the necessary powers to check such malpractices, if a committee is appointed to investigate such imports during the past say 20 years, it would probably be a revelation, as to the large amount of foreign exchange that has been drained from this country.

At one place you say that this Bill is sufficient to stop malpractices. In the end you say this Bill is not sufficient. How do you say two different things?

Shri T. Durairajan: All that I have meant is, even under the present Bill I do not think the Controller of Patents nor any Ministry can question a firm if they are going to import a basic chemical which is very effective in the treatment of Cancer for Rs. 10,000 and process it here and sell at Rs. 30,000. How are you going to check it? If a Committee is appointed, they can go into the question of prices that these firms are charging and the moneys they are paying to their parent Companies to import intermediaries. Coming to intermediaries, take the case of Sulphathiazol. If the basic price is only 15 shillings a kg, they have been paying 20 shillings to import the intermediary because they are able to realise a much better price in India. They import Acetyl sulphathiazol and make lot of money on that. There is no point in my saying it as a gospel truth. That is why I have suggested the appointment of a Committee who can report to Parliament.

Shri Bibhuti Mishra: You pointed out in your memorandum that some malpractices have been committed by some companies. Could you give us some examples as that would help us?

Shri Bade: Instead of pointing out such malpractices, if you could suggest some provisions to be made in the Bill itself, that would be better.

Shri T. Durairajan: Unless you are satisfied about the correctness

of what I say, how are you going to act?

Shri K. K. Warior: You can substantiate that general statement.

Shri T. Durairajan: I cannot go into the books of those firms nor can I have access to the custom bills of entry.

Mr. Chairman: I might tell you that the matter is being referred to the Tariff Commission.

Shri Bibhuti Mishra: He says that there are malpractices. He also suggests setting up of a Committee which will go round the country and then submit their report to the Ministry. Thereafter that Ministry will consider. Instead of doing that in a roundabout way, when you say that there are malpractices, can't you give examples as that would help us?

Mr. Chairman: He says that he has no details with him. But, I can tell you that the matter is being referred to the Tariff Commission.

Shri Bibhuti Mishra: If that is referred to the Tariff Commission there will be a long process.

Mr. Chairman: What else can be done?

Shri Bibhuti Mishra: Let him say the places where such malpractices are being committed.

Shri T. Durairajan: Let us take an example. Take Chloramphinicol. This is the name of the drug. That is being sold in the name of Chloromycitin by a firm named Park Davis; they have got a factory in Bombay. Do you know as to what they are doing? They were importing the last stage of chloramphinicol purified that, bottled it and then sold it. As compared to the world price for the finished product, the price that they were paying to the parent company for the intermediary was far in excess of the price for choloromephinicol. All firms pay the price only for the finished products. It is not possible to get competitive prices for the intermediary unless some other countries also have submit a manufacturing units. The prices they pay for intermediaries are far in excess of the world price the reason behind that being obvious. Take for example sulphadiazine and sulphathiosol. All that they were doing was importing the last stage, and then purified the same and then they sold it. The prices paid for that were, in my opinion, far in excess. But, you may not be able to accept what all I have said as correct, as I have no factual data to prove the same. Even if I ask the firms, they would not give the details. Unless the Government authorises somebody to get these details, they would not care to supply them. You know Sir, that there was a pharmaceutical enquiry committee set up in 1950-51. Here also, I don't think that any firm ever cared to answer all the queries. Circulated to them as originally they did not have the necessary powers.

Shri Bibhuti Mishra: This is a very serious thing. He says that lots of foreign exchange are being drained out. He should prove that. He must tell us as to the places wherefrom the foreign exchange is being drained out. We must know that since we are suffering very much for want of foreign exchange. All sorts of agitations are going on in the country. That is why I say that he must give us in writing the places wherefrom our foreign exchange is being drained out.

आज सारा देश तबाह हो गया है।- फारेन एक्स्चेन्ज की वजह से हमको डिवेलुएशन करना पड़ा जिसके लिये सारा देश आन्दोलन कर रहा है। उन को पता है कि कहां कहां से हमारे फारेन एक्स्चेन्ज का खात्मा हुआ। कहां से फारेन एक्स्चेन्ज घटा है। उन जगहों का नाम बतलायें, आदमियों का नाम बतलायें, उन को टेरिफ कमिशन के पास भेजें, प्राइम मिनिस्टर के पास भेजें। जब चोर पकड़ लिया गया तो उस चोर का पता तो बतलायें।

Mr. Chairman: He has given you three or four names. He has not got the other names.

Shri Bibhuti Mishra: Let us ask him to submit a report in writing as to the places wherefrom the foreign exchange is being drained out.

Mr. Chairman: He has given the names.

Shri Kashi Ram Gupta: From the memorandum that you have given and the suggestions put in it, I conclude that you have a picture of basic research being done by the Government Institute.

Shri T. Durairajan: Except for my having gone round the institutions whenever I had opportunities, I have had no further knowledge about what exactly they are doing.

Shri Kashi Ram Gupta: My point is that when you recommend a certain thing, the picture with you is that basic research should be done by Government Institutes. Is that your idea?

Shri T. Durairajan: That is correct.

Shri Kashi Ram Gupta: Therefore, you have based your suggestions on the fact that all pharmaceutical industries must be doing only the product research or the applied research and not the basic research.

Shri T. Durairajan: Pharmaceutical industries are more interested in what might be called processing of household remedies. At present only one firm is doing, what may be called basic manufacture.

Shri Kashi Ram Gupta: Perhaps you do not know. Productions from Indian factories are the results of their product research in India both in the public as well as in the private sectors. In Bombay, there are lots of factories doing product research. My point is this that in India, product research is part and parcel of the pharmaceutical industries alone. You have yourself mentioned that they get income-tax relief and so on and so forth on that.

Shri T. Durairajan: That is correct. But, so far we have had no results. That is all I can say.

Shri Kashi Ram Gupta: The question of result is not there. But the question of taking up the work is there. They have taken up this work and they are doing that.

Shri T. Durairajan: I have no objection to what you say.

Shri Kashi Ram Gupta: Have you not seen any one doing the product research?

Shri T. Durairajan: Excepting that they have set up some research units I don't think that they have set up production units.

Shri Kashi Ram Gupta: CIBA is doing basic research. They are doing product research too.

Shri T. Durairajan: These units are set up with a view to finding out the way of reducing the cost of a product as well as to keep the longevity of the product. They might be doing all these things. All these things do take a lot of time. Let me explain about the antibiotics. Tetracycline is now invented. They get the soil from some country; that soil is given all the necessary food and then grown. When that soil is further processed it produces a sort of a chemical. It is only from that chemical that they are able to isolate tetracycline. But that takes a lot of time. Once they are able to isolate the chemical and find that it is not toxic and it gives results, then they preserve the basic mother culture and defreeze it and produce the product.

Shri Kashi Ram Gupta: Naturally, the question is that if such a research is going on in some of the laboratories it means that the expenditure on that item is an additional expenditure.

Shri T. Durairajan: Every trader knows his job. They do not spend money from their capital. From profits they ear-mark a certain portion and spend on that item.

Shri Kashi Ram Gupta: My question is a simple one. When they do research, it is spending money extra than what others are doing. Naturally it will come out of their own money. There is no contradiction to it, but there is something extra that is done there.

Shri T. Durairajan: That is correct.

Shri Kashi Ram Gupta: Dou you know that Hindustan Anti-Biotics, Pimpri has got a patent for certain anti-biotic?

Shri T. Durairajan: Yes, for Haemycin.

Shri Kashi Ram Gupta: You have suggested 10-year period for the patent. Do you want this period to commence from the date of completion of the specification or from the date of the grant of patent?

Shri T. Durairajan: From the date of application.

Shri Kashi Ram Gupta: You have not suggested that.

Shri T. Durairajan: As per the Bill it is from the date of application.

Shri Kashi Ram Gupta: You are wrong. In the Bill it is from the date of completion of the specification and not from the date of application.

Shri T. Durairajan: When I said 'from the date of acceptance, I meant the date of application. If you say 'from the date of sealing', many difficulties will arise. Suppose, the patentee makes an application to the Patent Office for patent and the Patent Office calls for some more information and removal of some irregularities and after they satisfy themselves, they accept the application and once they accept, it is only from that date the period should count. I would like to make it clear that it is not from the date of sealing.

Shri Kashi Ram Gupta: Here, in the Bill it is given that the date of completion of the specification is named as the date of patent. Do you agree to that?

Shri T. Durairajan: Yes, that is correct.

Shri Kashi Ram Gupta: You see clause 43(1). The date of the patent means the completion of the specification. That means the filing of the complete specification and not the initial application.

Now you have suggested that in certain special cases an extension of 2-3 years can be given. Now you will realise the importance of the difference between the date of completion of specification and the date of sealing which may take 2-3 years. Instead of doing like this, why should we not have 10 years after the date of sealing?

Shri T. Durairajan: Why I am saying so is: in some cases it may take 10 years from the date of application to the date the Patent Office seals the patent. The proceedings may go on and it will unnecessarily drag on and may give an unfair advantage to the litigant. In order to get over this anomaly I merely said 'from the date of acceptance of the application'.

Shri Kashi Ram Gupta: In the Bill there is a time limit given for the completion of the specification. We can similarly stipulate a time limit for sealing of the patent also.

You will find that the Bill provides 10 months for the completion of specification. An equal point can be that the Controller should finalise the sealing of the patent within 2 or 2½ years. That could possibly be put in the Bill.

Shri T. Durairajan: It could be possible, but it is also possible that the patentee can apply and go on getting time whatever may be put in the Bill.

Shri Kashi Ram Gupta: But once the time imit is fixed, then one cannot apply for time.

Then you have suggested that the royalty should be 7½ per cent. How did you arrive at this figure of 7½ per cent, not even 8 per cent?

Shri T. Durairajan: I did not want to think of 8. I suppose 3, 13 and 8 are not considered proper. It is purely guess-work. Instead of 8, I said 7½.

Shri Kashi Ram Gupta: You want a clause to be added for disclosure of technical know-how. You say that if the patentee gives a compulsory licence and if the licensee is not able to produce the goods, mere grant of compulsory licence would not be of any use. You know royalty is paid only if he is able to produce the goods. There is no use of putting a condition for know-how and the patent condition will be enough and know-how can be negotiated separately.

Shri T. Durairajan: My submission is that the patentee would have done his duty by simply giving a licence to the manufacturer and what the manufacturer does is his own business. What I say is: the licensee has to pay the royalty only if he is given the technical know-how, not alone the licence to manufacture.

Shri Kashi Ram Gupta: Yours is a registered firm. A limited company in such cases can be better suited. What is the hinderance for you to make it a private limited firm to increase your activities for the good of the country?

Shri T. Durairajan: I could have done it, but I have not chosen to do it so far.

Shri K. K. Warior: I wish to know how much difference you will make out if the patent rights are given to the process or to the product. Are they almost the same in practice?

Shri T. Durairajan: The only basic difference is this: if the patent right is given by the process, it will give an initiative to somebody else to find out an economic means of manufacturers and bringing down the cost. If I am a patentee and I am given a patent for a product, I will not care to find out any other process and reduce the costs.

Shri K. K. Warior: If the patent right is not given to the product also, don't you think that there will be more stealing of the know-how and infringement of the patent rights?

Shri T. Durairajan: Theoretically what you say may be correct by saying that there may be infringement. But as I said earlier—of course it is for you to give patent rights for the process or for the product—if you give patent for a process, then the patentee would try a number of methods and choose the most economical process and get it patented. But if you give patent for the product, then he may not even think of doing that and even if somebody-else is able to evolve a more economical method, he will be shut out.

Shri K. K. Warior: Now as to the period of the patent rights, do you agree to a period lower than 10 years. Some countries are giving 5 years or 7 years. Why should there be 10 years? Why not a smaller period? Because you yourself said that even after the expiry of the patent, there are chances of marketing the same product and nobody competing it and there are chances of getting returns

and recouping the capital involved. So, why should we not reduce that period in consideration of so many other factors in India?

Shri T. Durairajan: This reduction in the life of the patent is not certainly going to give us much benefit. It makes no difference whether it is 10 years or 12 years. The patentee derives a larger share of the profit from the product after the expiry of the patent than during its life. There are figures to prove that. I will read out an extract concerning the United States. "The generic name is not the chemical name. The generic name is supposed to be a shortened name for the product. If your shortened is not very effective, you are going to have a very long name, but you can make it shorter. To come back to the problem you are talking about. Take a well-known drug such as Hydrochlorthiazide which is marketed under the names of Hydrodiuril and Esidri. And I think there are two or three other companies manufacturing it under trade mark names. Hydrochlorthiazide is not terribly difficult to remember but the advertising has it in extremely minute letters, and no effort is made to get the doctor to remember Hydrochlorthiazide. Effort is made to make him remember the trade names, Hydrodiuril or Esidri or one of the others." This is exactly what is happening in America.

Mr. Chairman: The doctors are brainwashed!

Dr. C. B. Singh: The doctors are so busy that they can't remember the generic names. They are generally very long and difficult to remember. The doctors can remember only those names which stick in their mind and are easy to remember.

Shri K. K. Warior: In the cost structure of finished products in the field of pharmaceuticals, what approximately will be the contribution through patent right which gives monopoly right?

Shri T. Durairajan: Easily 100 per cent.

Shri K. K. Warior: The cost is made up of so many factors and out of that, how much will this patent right contribute?

Shri K. V. Venkatachalam: Fifty per cent he says.

Shri K. K. Warior: It has been suggested that if this Bill, as it is, is passed, foreign capital would be scared away. What is your reaction to that?

Shri T. Durairajan: Unfortunately, I am not in a position to talk about it authoritatively. But I can tell you that this Bill, if enacted as it is, will not scare away foreign capital. I can even go to the extreme and say that even if we abrogate the patents law, foreign capital will come. The foreign companies who have come into this country and have had a strong hold here, did not come here to invest capital.

Shri Arjun Arora: Will you be able to tell us as to how royalties are paid? Is there any scientific basis on which the rate of royalty is arrived at, or is it merely a matter of bargaining?

Shri T. Durairajan: It is a matter of bargaining. But from the royalty agreements which I have had occasion to see, it is one of the two ways: cost of manufacture, which will include factory overheads and administrative overheads, plus 15 per cent of the profits for the licensee for manufacturing in a foreign country; the difference is shared on a 50:50 basis; alternatively it is a flat 15 per cent subject to tax.

Shri Arjun Arora: Do you know of any case where an Indian firm has entered into an agreement on the basis of 50:50?

Shri T. Durairajan: I can't remember. But even if there is any agreement, I suppose the Government ought

to know for without the sanction of the Government, he can't enter into an agreement. He has to get the consent of the Ministry of Finance and the Ministry of Industry.

Mr. Chairman: Any more questions?

Shri T. Durairajan: Sir, I may also mention that we have some trade marks that have never been worked. They were only exporting these articles. So these products were not available here. Now when an Indian firm tells the Government that it would like to manufacture this and pay them a 2 per cent royalty, the Ministry will say "we will not sanction." It happens not only in the pharmaceutical industry but even in the engineering industry. But what is happening is, for example, there is firm called A.B.C. Limited, London, and that firm has got a subsidiary company at Bombay, known as A.B.C. India Limited, with a capital of Rs. 5,000. This firm is authorised by the firm, A.B.C. London to manufacture the product in India. Now, it is only when they employ a certain number of people that they have to go to the Ministry of Industry and apply for an industrial licence. In the small-scale industry, they need not apply for a licence. They merely ask some factory in the small-scale sector to manufacture it for them. They need not apply to the Government at all. They manufacture it. Now, if the cost of production is Rs. 9 per dozen, then the Indian firm sells it to them at Rs. 10 or Rs. 11 per dozen. They then market it at Rs. 25 per dozen. The profit which come to 100 per cent minus expenditure on advertising, etc., is remitted to U.K. (The whole of the profit) I just wanted to show that trade marks and patents are related to each other. They are now dealt with by two different Ministries, trade mark by the Ministry of Commerce and patents by the Ministry of Industry. About the products that are manufactured and sold, neither the Ministries nor the Drug Controller have any knowledge. But still money is being remitted out of this country and the Reserve Bank of India have merely to sanction it for a company owned by a foreigner. At the end of the year, they merely file the balance-sheet and say "we have paid the taxes, the money has got to be remitted." But about the product the Government knows nothing. I can give a number of products which are being manufactured in this country. Here are two products which I picked up as I was coming along. One of these products has been coming to India for over 50 years.

Mr. Chairman: Thank you very much.

Shri T. Durairajan: This is only a trade mark. There is no question of patent. It is purely a mixture or a combination of a few drugs and is being sold under a trade name.

Shri Bade: In Japan no body is allowed to import manufactured drugs. They must manufacture it in Japan, and they must show the know-how also and unless and until they show this, no foreign manufacturer will be allowed to import goods. He must manufacture in Japan. If such a provision is made in India, what have you to say?

Shri T. Durairajan: Japanese pharmaceutical industry is controlled only by 5/6 firms. I know this firm of Takeda. Before the first World War they were agents for the German firm, Bayers. Gradually this Takeda, who was only a distributor for Bayer products, today he has become a giant. There are only 5 factories and all the pharmaceutical manufacture is done by these 5 people. As opposed to India, in Japan all these factories are controlled and owned by the Japanese people. They have really been much advancing. There is no point in comparing ourselves with them. It is just like saying my neighbour's son is a scientific worker, whereas my son is in the third or fourth form.

Shri Bade: If we make this provision in our Bill....

Shri T. Durairajan: We can make a provision but we must have the necessary background. With regard to industrial development until we have that, I am afraid, we cannot do it.

Mr. Chairman: Thank you very much.

(*The witnesses then withdrew*).

II. **Pharmaceutical Manufacturers' Organisation, Ahmedabad.**

Spokesmen:

1. Shri Hasmukhlal C. Shah.
2. Shri I. A Modi.

(*The witness were called in and they took their seats*)

Mr. Chairman: Gentlemen, the evidence that you give is public. It will be published and laid on the Table of the House and distributed among the Members. Even if you want any portion to be confidential...

Shri Hasmukhlal C. Shah: I think, it is not necessary.

Mr. Chairman: We have received your Memorandum. It has been distributed to all the Members. If you want to stress any particular point, you may do so. Afterwards, our Members will ask you questions.

Shri I. A. Modi: In our Memorandum we have stressed all those points.

Mr. Chairman: By and large, you are in agreement with the provisions of the Bill.

Shri Hasmukhlal C. Shah: We fully agree with the provisions of the Bill.

Mr. Chairman: Anything on which you differ, you may just dilate.

Shri Hasmukhlal C. Shah: The only thing I want to stress is about compulsory licensing and free licensing. The procedure for licensing should be so simple that anybody can take up the production pending a decision of the Tribunal or special body appointed for deciding that case. Ultimately, the royalty would be given by the firm and if they are in agreement with that and also in agreement with the Drugs Controller Department that the drugs manufactured by the firm are, in agreement with the rules and regulations, then the firm should be allowed to manufacture that particular drug pending decision about the royalty. Sir, in some cases what happens is that it takes lot of time to decide the case of licensing. Sometimes it takes 4 to 5 years. It you take the example of Tolbutamide, it is still in Bombay High Court. It is lying there for the last 4 years and the poor Indian people are suffering. They are selling the drug at Rs. 187 per 1000 tablets and if we are allowed to manufacture by buying raw materials from the Italian market and if it is manufactured in India by Haffkins, and if we are allowed to buy that, we will be selling it at Rs. 60 per thousand tablets. The poor Indian people are getting 300 times more costlier products. The poor people are really suffering and they need the real help. If we can do this service to our Indian people, we would be very grateful—I mean if we are allowed by the Government to do so. Provision is already there about compulsory licensing but then it has to be made little more stricter and much easier also.

Mr. Chairman: What do you suggest.

Shri Hasmukhlal C. Shah: We suggest that if we make an application for licensing and if we do not hear anything from you within 6 months, we must be allowed to produce or manufacture that particular drug provided the Drugs Controller's administration Okays it, because it is a drug and the Drugs Controller's Department must go through it. That is our contention, Sir. Compulsory licensing alongwith royalty. Royalty may be decided by mutual agreement with the patentee, but there

should be a maximum and, as you have suggested in this Bill, 4 per cent, we are agreeable to that part of it also.

Shri I. A. Modi: In substantiating our Memorandum before this Committee, we want to put three important questions. These questions are —as we understand today as far as this Patent Bill is concerned, I think it is mainly opposed by those parties who are either foreign manufacturers or are in collaboration with them. If we study the history of this Patent law in all the countries of the world, I think almost all of them have no patent for the product. I say why you want it in India? In what way, if you are interested to serve the interests of the country, will the interests of the Indian people be served if this amended Patent Bill is adopted? That is one thing. A few other points are rather being put forward that this bill should not be adopted or accepted. It will be one thing if I just say, as Justice Ayyangar has put in his Report, it would be an exaggeration to say that the industrial progress of a particular country is considerably stimulated as to whether the system is suited to it or not, that we will have to decide. We will put a few questions. What are the facts? Has our country shown any progress in these 19 years in any new invention under the present patent protection? I say the answer is definitely 'No'. I do not think in India we have been able to do anything better under the present Patent law, as they claim, it will be in our interests and the technology will be flowing from developed countries to the undeveloped countries like India. Rather this country is given unimaginably exhorbitant prices for life-saving drugs. The question arises how one can develop? I say, naturally one can do it by marketing such products which are more in use and which are more upto date. The volume of turn-over will keep the prices down and will provide funds for research. Thus both are benefited—the poor suffering humanity gets the product cheaper and the organisation gets the funds to initiate research. After all, for any research the funds are very important. And these funds do come only from the turn-over of the organisation and this turn-over of the organisation is never possible if up-to-date things are not taken for selling or for trading. That is most essential. Another thing, we believe, is that if this patent is restricted to only process, as it is recommended by this Patent Bill, it will rather instigate competition and instigate more researches. An organisation will be compelled for more and more new inventions due to competition and demand in the field. After all this research is being done by large manufacturers not because they want to do any good or charity to the public or to the humanity but for their own survival; rather to meet competition with other manufacturers in their own country they will have to continue this research, I say, every day. So if compulsory licensing comes, naturally there will be more and more researches. I think the world will be greatly benefited by this. About compulsory licensing I will take two minutes. Justice Ayyangar has quoted a quotation from Sir William Houldsworth: "Anything like compulsory licence given by a foreign patentee to manufacturers in this country would not meet the case. The foreign patentee acts as a dog in the manger, sends his patented articles to this country, but does nothing to have the patented articles manufactured here. He commands the situation and so our industries are, under our own law, starved in the interests of the foreigner.....Those who feel most strongly on this question think that there should be nothing but an absolute revocation of the patent if it is not worked in this country within two years and the Fry Commission was of that opinion... The clause as presented in the Bill does not fulfil the ideal which was recommended by the Committee but it goes a long way in the direction. At any rate. it is an immense improvement in the

present position and therefore it is acceptable."

Sir, my submission is that it is in the interest of India as well.

Shri Hasmukhlal C. Shah: There is a slogan now "No patent, No New Drugs". I fully agree with that, but at the same time I disagree with that. If this is the case the space Research done by Russia would not have taken place. In these days of competition whether people get money or not but by one or the other reason they like to work and when and where they work they always get some new Research. For what such good money is spent by such Socialistic countries. Sometimes the personal ego is also responsible for the new research. Great scientists have never bothered about money. Fundamental researches are all done for the benefit of the human being and not for money. It is said that the prices of the unpatented drugs are higher in India than others. This is because the intermediates and the raw-materials manufactured in India are purchased at higher prices. The processes for the same products manufactured in India and other countries are the same but here because the raw material costs high and because we have to pay very high price for intermediates the price structure here is high than compared to any other country. The other raw-materials required in some products manufactured in India are costlier. Secondly, the initial cost of equipment, building, etc. are higher. Also the import duty, excise duty, on various raw materials are levied very high. These all constitute the prices of the Drugs manufactured in India which are not patented or whose patents have expired. The processes followed are almost the same in this country or in any country. Secondly, in some cases much advanced processes are found than the old patented one and hence the cost of production is lower. In case of Italy when a price of a product is higher, it is because sometimes high cost of production and higher standard of living and higher margin of profits and less competition. If you go to African countries, South East and Eastern countries you will find that lot of firms of repute sell their products at one-third of price sold in other countries. That is the reason why Indian manufacturers are not able to compete them in other countries. We just take one example. Some people are talking about Librium of F. Haffman La Roche & Co. It is said that Librium is the product of confidence and hence in India 76 per cent is the sale of this product. Six firms producing similar products captured 21 per cent of the market. The remaining firms cover only 3.4 per cent of the market who are selling at a reasonable price. They argued that the cost structure on the product is very competitive but it is the confidence of the doctors for the drug which is more responsible for the promotion of the product. I just do not understand why such a huge amount is spent on promotion. In India today the self-same situation exists. An Indian firm imports the active ingredient of Librium at Rs. 312 per kg. from Italy, while the original inventor supplies to its associated company in India at Rs. 5,555 per kg. Why such a fantastic price is charged by the patent holder? I am sure some of the learned member of the commission know that this was discussed in the Parliament. But a drug is imported in India only when it is approved by the Drug Controller of India that the claim made of the product is genuine and the Drug Controller of India approves that the chemical produced at Italy is the same of Librium which is imported at Rs. 5.555 per kilo from Switzerland. In putting this figure before you I have no other intention, Sir, but to impress upon you all learned Members that for what we are paying such an extravagant price at the cost of poverty of India? I am sure learned people like you would understand the situation in giving an undue protection to the patent law. In this case, compulsory licensing should

be the best solution and if compulsory licensing is made the patent concern would reduce the price to compete the sale for their business as well as prestige. The product Patent which has been given is really very much favoured by those people. They like it because if there is product patent then nobody would be able to compete and they would be having the monopoly of the same chemicals and the product in India.

I have not observed a single Research done by any foreign concern in India for the last 17 years which is worth the name. I do not know where the profits go which they claim to be 5 per cent to 20 per cent. What is the idea of recovering such high Research prices when they are not going to make any Research here in India. This clearly means that for initial stage research is not possible and hence the Big International Firms have not made any contribution for Research in India so far. So it clearly means that for initial stage research is not possible as it is done in Italy and proved by Big International Firms who are recognising the Patent Law in India.

Now we cannot just start abruptly. They want us to run the race with them when they are already 100 years ahead of us. They have already crossed the initial difficulties. So we must be put at the same level. Then it would be easier for us to compete with each other. For 10 years all these patent laws should be kept aside to allow us to develop our technology as Italy has done it.

So far very few patents have been taken by Indian research workers. Only few Indian research workers—very few I say—because there is not an outstanding research in India for medicines and drugs. In that case 54 crore Indians are suffering. We are paying very high prices for drugs. Now, take this medicine Oxichlortatracycline, even Government of India, *i.e.*, Hindustan Antibiotics wanted to manufacture and they advertised saying that they are putting the drug for 8 annas a capsule but some foreign firms intervened and as such even Government could not do much about this. So if Government felt helpless because of the patent laws for small firms like us it would be very difficult to go ahead with the research. Without having the momentum of research as Italy has got it will be really very difficult. In Italy they allowed the patent for 10 years and only the process which the inventor has developed. If he feels that this particular drug can be manufactured by 100 methods those 100 methods have to be patented and not one.

In India the patents are accepted from the date they register in the country. Now I differ with this because the patents should be exploited from the date it is registered in the country where it is registered first. Now it happens they register in their country in 1961 and come to India only in 1966 and so they register the patent after 5 years. Now they have already got the advantage of those years. What I mean is. Sir, the patent should be registered not from the date of application but from the date that has been registered in another country first so that whatever they have made they should pass on to us earlier.

I further submit that most of the research done by the Big International Firms are for their personal prestige and also for the personal profits and existence. There is a very keen competition between the big international firms and for their existence they have to make their research for their own people. When they make research they never keep in mind India. They are making research for their own country and hence they decide their prices and to my mind most of the drugs get back the money spent on their research in the first few years. My contention is that primarily the research was made for their own coun-

because the organisation is doing research for its own survival, and to survive competition in its own country. They will have to do research and find out something new. Otherwise, they know that the huge amount of profit will go away. By the way, I will not be doing anything wrong if I give the example of our organisation. I am talking of the Indian Pharmaceutical Association. In 1965, in Baroda, our Indian Pharmaceutical Congress Association passed a resolution in favour of this Bill by a thumping majority. It would not be an exaggeration if I say that the thumping majority was 99 per cent. But to our bad luck, in the IPA, the foreign collaborators managed to come on the committee to chalk out the memorandum against the will of the 99 per cent; rather the view of a few persons prevailed in the memorandum which opposed the Bill. This will give an idea of the limitations under which we work.

The name of Justice Ayyangar is being used. It is said that he was also not in favour of fixing a royalty. The Patents Bill fixes a royalty in case of the drugs and medicines to a maximum of four per cent. Justice Ayyangar was aware and thought that it is very necessary that some thing should be done. He has said why he was not in favour of fixing a royalty. He has given his reasons. Firstly, the percentage varies from industry to industry. Secondly, no reasonable rate can be arrived at, and thirdly, if the maximum rate is fixed, there will be a tendency for the licensee to ask for it. While formulating this Bill, the same question should have arisen in the minds of others also as it arose in my mind. Suppose I apply for a licence of right and I am asked to start the manufacture of a drug, now If I do not know I have to pay a maximum of four per cent, there is always a sword hanging on top of me. If the controller at the end fixes 15 per cent and if I calculate three to four per cent, the whole thing will go phut. So I will have no enthusiasm to work the patent and put it on the market. And so, for that very reason the fixation of a royalty is a "must". Otherwise, with a hanging sword above, it will be very difficult for an Indian licensee, without any danger, to proceed ahead. What about the court decision? I was a party in the the Tolbutamide case. So, maximum royalty is a "must" and we agree it should be 4 per cent. In 1919 even the U.K. had found it necessary to amend their Act and introduce section 33A so that in chemical substances, only the process can be patented. After that UK industry started making remarkable progress.

In clause 5, the plural "methods or processes" should be removed and only the singular "method or process" should be put. Take Tolbutamide for example. This can be produced by so many processes and Hoechst have taken a patent for this product with the result that all the imaginable processes for producing this product have been covered and every road is blockblocked. The Hafkin Institute have been successful in making this product through an impossible process. But they have been challenged by Hoechst in a court of law. So, only the singular "method or process" should be used in this clause.

If this Bill is passed, we can get the licence of right under the compulsory licensing system after paying royalty. Even Justice Ayyangar has found that it is the experience of each and every applicant for the licence that the real technical know-how is not given, but it is hidden. So, after royalty is paid according to the Controller's decision, if the licensee cannot work on the process which is declared in the patent office, then it should be made obligatory on the patentee to give that technical know-how whenever it is demanded. Then only payment of royalty will be justified.

So, for a country like India, this Patent Bill is the minimum and it is a "must".

Sardar Daljit Singh: In your memorandum you have said:

> "As we could see crystal clear, we have waited for 18 years and now let us wait for another 18 years without patent restrictions and watch the progress."

What are the arguments to support this?

Shri Hasmukhlal C. Shah: You will be surprised that all these 19 years not a new product or patent worth the name has come out. In India 80 per cent of the production of pharmaceuticals and drugs is by foreign collaborators or their associates. When we ask the reason for their high price, they say it is because of research expenditure. If that is so, why have they not been able to do anything in India in these 19 years? Some of the foreign manufacturers have no research laboratories at all. What they charge in the name of research may be spent by them in some other ways to suppress us or transfer the money to their countries by paying higher prices for the raw materials. In the case of librium, the Italian firm sells the raw material at Rs. 312 per killo while the associates of the foreign firms charge Rs. 5555 per kilo—1800 per cent more; So, their librium is costlier. So, this is our experience during the 19 years as a result of the patent law given to us by our big emperors. Let us wait for 10 years. Let us put the patent law out and take the challenge from your young scientists and technologists and see how far they can go.

Shri Bibhuti Mishra: You are not in favour of patents. Then, what is your plan to develop medicines and drugs in India?

Shri I. A. Modi: We have not said that the Patent Act should be abrogated. We endorse this Bill. What we say is that this patent protection should not be restricted to the product, it should be restricted to a process only. If this is done, then our scientists will think of different processes than the one which is patented. In that way we will be able to produce the product which has already found use in the world. Like that our country will flourish, our scientists will flourish and we will have some kind of equipments. Now we are not allowed to think of other processes. We are discouraged in the initial stages itself.

Shri Bibhuti Mishra: Do you mean to say that by this method the price will be cheaper?

Shri I. A. Modi: Hundred per cent. We are already marketing a product at a cheaper price Diatol, which is like Tolbutamide, we are supplying at Rs. 35 per 1000 whereas the other one is being sold for Rs. 175. Librium, they sell at 18 paise per tablet whereas the Indian manufacturer is selling it at only 6 paise. There is Lidocane which is just like Zilocane. We are selling it at Rs. 170 per Kg. whereas Geigi are sell-it at Rs. 866. These foreign manufacturers also help each other. When Lidocane was offered at Rs. 170 one foreign manufacturer in India refused to have it just to discourage the Indian manufacturer.

Shri Kashi Ram Gupta: You have said in your memorandum that India is still in its initial stages of progress and till it reaches a satisfactory stage of development we should follow the Patent Law of Japan. The latest Patent Law of Japan is of the year 1959. That law provides a period of 15 years. So far as Itlay is concerned it has recommended a period of 10 years. Russia also has got a patent law. Now, you have arrived at this 7-year period. You quote Japan, Italy and Russia where it is not a period of 7 years. How have you arrived at this period of 7 years?

Shri I. A. Shah: They tried without patent laws for about 20 to 25

years Then they came to the conclusion that if the period is kept at 10 or 15 years it would be to their advantage. Here, when we have no chance to develop ourselves even after 7 years, if we can get some clue from the patent then we would be able to do it much faster, and 7 years time is enough for them to make whatever money they have spent because in the initial stages there is no competition and the prices are kept high. The example of Japan has been put in wrongly.

Shri Kashi Ram Gupta: You are quoting Justice Ayyangar's report. Are you aware of the fact that justice Ayyangar has not supported the view of reducing the period to such an extent?

Shri I. A. Modi: That does not mean I cannot differ from the views of Justice Ayyangar. India is a vast country with a population of 50 crores or more. Any organisation will have ample time within seven years to recover the expenditure. Secondly, we have taken shelter under the Kefauver Committee Report. If, with twenty major Companies, the research expenditure has been 6¼ per cent, seven years would be more than sufficient to recover the expenditure. For a country like India, in our opinion, the patent law should be abrogated for a few years, but because we have to get help from others we have suggested that let the period be seven years.

Shri Kashi Ram Gupta: Can you give statistical data to prove this?

Shri I. A. Modi: Let them give their figures; I will justify it.

Shri Kashi Ram Gupta: The other party gives the argument that they spend on research. Do you mean to say that even if they spend on research 7 years will be sufficient, or that they do not spend on research and therefore the period of 7 years is sufficient.

Shri I. A. Modi: Even if they do research, this period of 7 years will be more than enough.

Shri Kashi Ram Gupta: Are you in favour of putting off the pharmaceutical industry, say, for 10 or 20 years on the ground that research in this country will develop as also the basic research?

Shri T. A. Modi: Yes, Sir.

Shri Kashi Ram Gupta: Are you aware of the fact that basic research in India can be done only by Government institutes or some such bodies and not by the pharmaceutical industry as at present?

Shri I. A. Modi: I think everyone can do it with little more resources.

Shri Kashi Ram Gupta: You mean basic research?

Shri I. A. Modi: Yes, Sir.

Shri Kashi Ram Gupta: Are you in favour of basic research being done by institutes other than Government institutes?

Shri I. A. Modi: Yes, Sir. That can be done.

Shri Kashi Ram Gupta: What is the approximate capital expenditure on a research institute?

Shri I. A. Modi: I think the Government should do that. They are doing it.

Shri Kashi Ram Gupta: Therefore, I put the question that only the Government should do that.

Shri Hasmukhlal C. Shah: There are national laboratories. They are all doing research and the application of research can be taken up by all the firms.

Shri Kashi Ram Gupta: Because the Government laboratories are there, basic research can be done there and the pharmaceutical industry can take up other sides of it.

Shri Hasmukhlal C. Shah: Yes, Sir.

Shri K. K. Warior: The provision of the compulsory licensing is there even under the present Act. May I know how many times you have taken advantage of that?

Shri Hasmukhlal C. Shah: There is a provision of compulsory licensing in the present Act. But nobody has been able to take advantage of that because very few people know the process of having compulsory licence. The process is so cumbersome, so difficult and so time-consuming that a small manufacturer gets fed up with it. He has to go to the courts. You have to go to the High Court, then to the Supreme Court and then you have to have evidence. Who bothers about this? So, the process should be simplified.

Shri K. K. Warior: Is it your experience or is it your anticipation.

Shri Hasmukhlal C. Shah: It is our experience. About 10 firms in India have been sued by the Tolbutamide...

Shri K. K. Warior: You are only relying upon that one instance.

Shri Hasmukhlal C. Shah: That experience is more than enough. Even the biggest firm in India is not able to do anything about that. That case took about 4 years and yet it is in the High Court. It will go to the Supreme Court and it will take another four years. By that time, the patent will be over. That is the process of getting the compulsory licence or something like that. How can a small manufacturer do that?

Shri I. A. Modi: Here, I just want to state a very simple thing. After all, we are just coming up now. May I say it is just like that of a boy of six months there and you say, "I have put the cycle before you. Why don't you walk?". We are just coming up. Unless and until we have our resources, we have our equipments, how do you expect us to run to Calcutta and put an application for a compulsory licence? Let us come up and you will realise how many applications are coming for compulsory licence.

Shri K. K. Warior: I am only suggesting that you have not applied for a licence. I do not want the reasons. I only want the facts. I want to know whether you have made an application or not and whether you have got the experience of the legal difficulties or obstructions following that application.

Shri Hasmukhlal C. Shah: We have got the experience.

Shri I. A. Modi: We both had it.

Shri K. K. Warior: I wish to know whether now those obstructions will not be there according to the provisions provided in the present Bill. Are you satisfied with that?

Shri Hasmukhlal C. Shah: Yes, Sir. We want to make it a little easier. We have suggested that after the making of the application, if no result is coming up, if no reply comes, then, automatically after six months we can start the manufacture.

Shri K. K. Warior: I wish to know whether at the present stage of our know-how, we have reached a stage when we can take full advantage of this provision of compulsory licensing.

Shri Hasmukhlal C. Shah: We will be able to do it. As I told you, we have got two or three products already made. The patent is already there. The Suhrid Geigy sells for Rs. 858 and I can sell for Rs. 172 and yet there is no buyer. There is a syndicate of foreigners. They do not want Indians to come up.

Shri K. K. Warior: In the provision of royalty, do you also agree to include the necessity of handing over the know-how?

Shri I. A. Modi: I have already said that.

Shri K. K. Warior: You want 4 per cent or you are in a mood to give something more.

Shri I. A. Modi: It should be included in 4 per cent. That is more than enough. Morally, they are expected to give everything to the patent office.

Shri Hasmukhlal C. Shah: If a patent is taken only for a process he has to mention it. Then the know-how question will not arise.

Shri K. K. Warior: If it is only for one single process for a product, do you think that will be a sufficient guarantee of protection for our scientists and inventors who are now coming in the field.

Shri Hasmukhlal C. Shah: 19 years' experience has shown that no Indian scientists has come forward by having this protection.

Shri K. K. Warior: You must see not only from your own firm's point of view but from the point of view of the developing economy, developing of our scientific and technical knowledge and also possibility of opening of our petro-chemical industries and other basic industries. In view of that, do you think that this will be sufficient protection if it is only for one single process for a product.

Shri I. A. Modi: Yes, Sir. If a man is very particular, he may have patents for three processes. One patent means one process.

Shri K. K. Warior: The same person can take as many patents on as many processes he likes.

Shri I. A. Modi: Yes, Sir.

Dr. C. B. Singh: I must accord my appreciation of the spirit underlying the evidence given by them. They have mentioned that for 10 years there should be no patent law. I would like to ask one question. It is better to learn from the experience of others. Italy had no patent law for drugs and pharmaceuticals. Do you know what was the experience of Italy when they had no patent law at all?

Shri I. A. Modi: Yes, Sir. I would like to draw your attention to the Senator's Report. In that he has mentioned that Italy has no patent law and yet it has developed a chemical substitute for influenza....

Dr. C. B. Singh: Don't use the word 'chemical'. I am talking of the pharmaceuticals.

Shri I. A. Modi: It is a drug; it is a chemically manufactured drug.

Dr. C. B. Singh: Don't confuse the two issues.

Shri I. A. Modi: That drug was manufactured by Italy. It was their original research. An American firm has already made some agreement with them to market it in America. Like that, they have done a good work in the field of anti-biotics.

Dr. C. B. Singh: According to the list of patents for a single product patent in the world, the U.S.A. has got 355 patents, Switzerland—44 patents; Germany—33 patents; U.K.—28 patents, France—21 patents; Japan—3 patents; Italy—1 patent and India—1 patent. That was in the period when there was no patent law in Italy—only 1 patent in Italy whereas U.S.A. having 355 patents. How would you explain that? In the absence of any patent law, there was hardly any real advancement made in Italy in the pharmaceutical field. Do you agree with that?

Shri Hasmukhlal C. Shah: We do not agree with that. If you were in the market for the drugs industry, you would know that they are able to manufacture almost every chemical.

Dr. C. B. Singh: But they were all copying. They were not making anything new.

Shri Hasmukhlal C. Shah: Even by copying, they have developed research and technology.

Dr. C. B. Singh: You will agree that they were copying only?

Shri Hasmukhlal C. Singh: We are copying everything in this world.

Dr. C. B. Singh: I am talking about Italians. They were only copying? Is it not? You are now trying to copy again. You are copying all the time. Is it not correct?

Shri Hasmukhlal C. Shah: We have not been able to copy others because the patent law was against us. We could not do so. That is the reason why we want a recess to copy others.

Dr. C. B. Singh: As a result of no patent, you will be able to produce nothing new.

Shri Hasmukhlal C. Shah: Italy could manufacture so many things and they have been able to reduce the price of drugs.

Dr. C. B. Singh: You are again harping on the same point. They have been able to reduce the price because of copying others. Nothing knew was produced by them.

Shri Hasmukhlal C. Shah: May I ask: By having the patent law for 19 years, what have we achieved?

Shri Kashi Ram Gupta: That is not the way of answering questions. The witness should not ask the question that way.

Shri Hasmukhlal C. Shah: I ask During the last 19 years what have we achieved by keeping this patents law?

Dr. C. B. Singh: Nothing. That is the greatest tragedy. What have you done in that regard?

Shri Hasmukhlal C. Shah: Let us now try that without the patent law We should learn by trial and error.

Shri I. A. Modi: Let me quote from Senator Kefeuver's Report:

"The Italian drug industry has also developed a number of possibly significant new drugs most of which are not available in the United States. Among these are several new anti-biotics, new anti-cholestrol drugs, new anti-fungus drugs, new ergot derivatives useful in easing child-birth, a new injectable chlorophenicol and a synthetic chemical which gives some promise of being effective against two strains of influenza. The significance of the last lies in the fact that influenza has a virus against which neither anti-biotic nor any other drug is effective. This new drug is being tested in over 100 hospitals in Italy; it is claimed to reduce the average length of illness by more than half and a leading American firm has already secured distribution rights in the United States.

It should be recognised that some of these developments are only in the nature of possibilities for the future. The Italian drug industry is largely a creation of very recent years."

Dr. C. B. Singh: Do you know what was the ultimate result of this Report in U.S.A.?

Shri I. A. Modi: That I do not know.

Dr. C. B. Singh: I may tell you for your information.

Shri I. A. Modi: These are the facts. Italy has done research in this field.

Mr. Chairman: Why tell them that. We know it.

Dr. C. B. Singh: They may not know it at all. They are quoting from this Report. I want them to know what was the ultimate result of that. A member of the Committee said:

"It has been my judgment that the hearing so far has been pre-

judiced and distorted. They have lacked balance; they are unfair to the industry, to Government agencies, to the Senate itself and to the public."

Mr. Chairman: Do you justify that attitude?

Dr. C. B. Singh: I do not justify it.

Mr. Chairman: Then why I ask that?

Dr. C. B. Singh: They are quoting from that.

Shri Hasmukhlal C. Shah: We are quoting the facts alone.

Dr. C. B. Singh: They have, more or less, brought about cases in the court about drugs used for conditions four main types of that is, anti-biotics, anti-diabetic, anti-rheumatic and anti-sedative. These cases are still going on in the country.

May I know what is the proportion of patented and un-patented drugs used in this country?

Shri Hasmukhlal C. Shah: I don't know. The hon. Member may give the percentage.

Mr. Chairman: If you do not know, say so. That is all.

Dr. C. B. Singh: I know you have no idea about it. About your own firm, how many unpatented drugs are you sending out?

Shri Hasmukhlal C. Shah: Almost hundred per cent. Because of this patent law, we cannot manufacture any product.

Shri Arjun Arora: You have suggested that the patent law should be abrogated for 10 years. Do you think the drug industry in this country will be able to achieve self-sufficiency in 10 years?

Shri Hasmukhlal C. Shah: This was only a mere suggestion.

Shri Arjun Arora: It was a good suggestion.

Shri Hasmukhlal C. Shah: If nothing can be done by having this patent law, at least give a holiday. That is what we suggested. Then, we can try our luck.

Shri Arjun Arora: Do you think Italy achieved self-sufficiency or near self-sufficiency in drugs during the 19 years that they have had no patent law?

Shri Hasmukhlal C. Shah: Not only self-sufficiency but they are feeding the world itself.

Shri Arjun Arora: So, do you think that Indians could do the same?

Shri Hasmukhlal C. Shah: I think so. We are 15 times more in number than they are. We will be able to do much better if the opportunity is given to us.

Shri Arjun Arora: How do you think abrogation of the Patent Act will act as an incentive for research?

Shri Hasmukhlal C. Shah: I think, you are misunderstanding us. We have never said that we want the abrogation of the Patent Act.

Shri Arjun Arora: You may not want it, but I want to know whether abrogation of the Patent Act will act as an incentive for research and whether research will gain momentum thereby.

Shri Hasmukhlal C. Shah: We have asked only for a compromise. If compulsory licence is easily available, abrogation of the Patent Act is not necessary at all, because that will serve both the purposes. It will satisfy those who want patents and also those who do not want patents.

Shri Arjun Arora: Those who try to satisfy both ends in satisfying nobody.

Shri I. A. Modi: As far as we are concerned, we feel that instead of total

abrogation, the present Bill will be more appropriate and more encouraging. Abrogation will not work; this Bill will work. That is our opinion.

Shri Arjun Arora: You mentioned the Italian example. Could we not imitate the Italians by not having patent legislation? You said that not only the Italians achieved self-sufficiency but they captured the world market; so, you wanted a holiday from patents.

Shri Hasmukhlal C. Shah: We have learnt from the Government's experience. The Government itself has given a holiday from income-tax for certain industries thinking that that would act as an incentive. So, we would like to have the same thing in regard to patents. The same arguments, which have been given by Government for giving a holiday from income-tax, would apply here.

Shri Arjun Arora: You have made a good suggestion that the date on which a patent is registered originally should be the date from which patent rights should begin in India also. Did you have an idea of the time-lag between the date of the original patent and that of the patent in India?

Shri Hasmukhlal C. Shah: Yes, Sir. It varies from two to three years; sometimes it is anything from 5 to 7 years.

Shri Arjun Arora: Have you come across any example of a patent being granted in India five years after it was originally granted anywhere else?

Shri Hasmukhlal C. Shah: At the moment I cannot remember any such example.

Shri Arjun Arora: Would you look up and send it to us?

Shri Hasmukhlal C. Shah: I will try to find out and, if there is any, send you the information.

Shri Arjun Arora: Is there any scientific basis for fixation of royalty or is it merely a matter of bargaining between the patentee and the licensee?

Shri Hasmukhlal C. Shah: If the expenses on research are 6¼ per cent, 4 per cent is more than enough.

Shri Arjun Arora: Do you agree that there should be a progressive reduction in the amount of royalty?

Shri Hasmukhlal C. Shah: We would be very happy if that could be done through this Bill. We will appreciate it very much.

Shri A. T. Sarma: In your memorandum you have cited many instances of foreigners exploiting and harassing Indians. Do you consider that by the passing of this Bill this exploitation or harassment of Indians will be restricted in future?

Shri I. A. Modi: Yes, Sir. If this restriction goes, our country will get the drugs and medicines much cheaper than what they are available for today.

Shri A. T. Sarma: Do you think that India is not lacking in technology and technicians in the pharmaceutical industry?

Shri I. A. Modi: India is not lacking in that. Even in the foreign firms, here most of the employees are Indians. They have enough qualifications. The only thing is that we are waiting for opportunities.

Shri A. T. Sarma: Do you know that even foreign firms in India are run by Indian technicians?

Shri Hasmukhlal C. Shah: Yes, Sir. They are run 100 per cent by Indian technicians. There may be one or two exceptions here or there.

Shri I. A. Modi: But, may I add, that even these Indian technicians are restricted by foreign tactics. I have one example of a friend of mine. What is being done by the foreign firm is this. My friend is working on one

project. That project seemed to have wonderful prospects; so, the man was immediately transferred to another project and that project has been transferred to their country. It is not now being worked in India.

Shri A. T. Sarma: Some foreign witnesses have expressed the desire that the Bill be postponed for the time being. Do you agree with that?

Shri I. A. Modi: No. The Bill should not be postponed even for a day. The move may be there; in fact, the *Economic Times* of July 9 in its editorial said "the recent re-thinking in New Delhi has rightly placed the emphasis on the factors mentioned against the Bi'l and there is no reason why some realistic approach should not be applied to patents." A nice rumour is there.

Shri R. P. Sinha: Have the witnesses visited the Pimpri factory at Poona?

Shri Hasmukhlal C. Shah: Yes, Sir.

Shri R. P. Sinha: Do you know what they are manufacturing?

Shri Hasmukhlal C. Shah: If we do not know all of it, we know something about it.

Shri R. P. Sinha: Do you know that they have produced a new drug, known as Haemycin?

Shri Hasmukhlal C. Shah: Yes, Sir.

Shri R. P. Sinha: Do you know what is their cost of production?

Shri Hasmukhlal C. Shah: I do not know.

Shri R. P. Sinha: It is Rs. 20,000 a kilo. Now if we give you the freedom that you want, that is, the freedom to copy, it will mean that the money invested in Pimpri and at other places will go waste. Do you want that it should be allowed to go waste?

Shri Hasmukhlal C. Shah: We do not want that it should go waste. Whatever expenses they have incurred, they should realise that.

Shri R. P. Sinha: How can they realise it if you have complete freedom to copy it?

Shri Hasmukhlal C. Shah: The technology is known to them much better than to the person who is coming new in the field; so, they would be able to do much better than the newcomer and by the time the new comer achieves that technology, they would have realised all their money spent on research.

Shri I. A. Modi: May I say that under this Patent Bill no expense is waste because we are paying royalty. If there are more agencies for making haemycin, perhaps they will get more compensation by way of 4 per cent than they are getting today by producing it themse'ves and selling it. We do not wish just to copy and not to pay the royalty. We want that royalty should be paid and will be paid.

Shri R. P. Sinha: Do you know what royalty they are getting from other countries?

Shri I. A. Modi: No.

Shri R. P. Sinha: They are getting $7\frac{1}{2}$ per cent.

Shri I. A. Modi: In that case, if Indian restricts it to 4 per cent it is very reasonable.

Mr. Chairman: How can you permit Pimpri to get $7\frac{1}{2}$ per cent if you want it to be fixed at 4 per cent in India?

Shri I. A. Modi: It is for people in those countries to object to $7\frac{1}{2}$ per cent and say that they will give only 4 per cent.

Mr. Chairman: You want Pimpri to get only 4 per cent?

Shri I. A. Modi: I do not want it. It is not that we are going to tell him, "please give 4 per cent or 5 per cent". When those people are concious of that, I think they will have to do.

Mr. Chairman: You cannot have one standard for one and another for the other.

Shri I. A. Modi: I do not say that. On one item you may lose 3½ per cent, but on thousand other items, you may gain. Patent law is a reciprocal law.

Shri Hasmukhlal C. Shah: If they ask 7½ per cent in their country, they have to pay 7½ per cent in our country. If we pay 4 per cent to them, they would pay 4 per cent to us.

Mr. Chairman: If you pay only 4 per cent, what is the justification for you to ask another country to pay you 7½ per cent?

Shri I. A. Modi: They may be demanding 7½ per cent. The justification is. . . .

Mr. Chairman: This is a matter which this Committee has to consider?

Shri I. A. Modi: Yes; naturally.

Shri Bade: About those patents which are running in foreign countries, their period should be counted by counting the period in India. If you look to Section 53, we have envisaged that thing also. The term of every patent granted shall:

"(a) in respect of an invention claiming the method of process of manufacture of a substance, where the substance is intended for use, or is capable of being used, as food or as a medicine or drug be ten years from the date of the patent; and

(b) in respect of any other invention, be fourteen years from the date of the patent.

"(2) Notwithstanding anything contained in the Patents and Designs Act, 1911, or in the patent granted thereunder, the terms of every patent granted before the commencement of this Act in respect of an invention claiming a substance or the method or process of manufacture in respect thereof, where the substance is intended for use, or is capable of being used as food or as medicine or drug shall be ten years from the date of the patent:

Provided that where at the commencement of this Act any such patent is in force by reason of an extension granted under the Act aforesaid, the patent shall cease to have effect on the expiration of the period of such extension."

And then all those patents granted for drugs and medicines, will be endorsed with "licences of right" automatically, *i.e.* automatic licensing.

Shri Hasmukhlal C. Shah: We fully agree with that automatic licensing.

Shri Bade: All the foreign patents will not be given licences.

Shri Hasmukhlal C. Shah: As far as drugs and medicines are concerned.

Shri Bade: About drugs and medicines, there is no question. The unexpired term of the basic foreign patent should be there, but not more than ten years.

Shri I. A. Modi: We have not studied that particular clause. So it is very difficult to express our opinion.

श्री चौरड़िया : आप चाहते हैं कि पेंटेन्ट पीरियड सात साल रखना चाहिए। आप जानते हैं कि हमारे देश में अभी तक विकास नहीं हो पाया है। विकास की सम्भावनाओं को देखते हुए और इस बात का ध्यान रखते हुए कि खोज करने वाले को खोज करने के ख़र्च का उचित मुआवजा

मिल सके क्या आप सात वर्ष की अवधि को पर्याप्त समझते हैं ?

Shri Hasmukhlal C. Shah: Looking to the population of this country, seven years are more than enough.

श्री चोरड़िया : क्या यह सही नहीं है कि अगर पेटेन्ट पीरियड साल सात रखा गया, तो उसका बहुत बड़ा हिस्सा तो पेटेन्ट कार्यालय का चक्कर लगाने और क्लिनिकल टैस्ट में व्यतीत हो जायेगा और एक दो वर्ष एडवरटाइज़मेंट में लग जायेंगे और इस तरह पेटेन्ट पीरियड समाप्त हो जायेगा ?

Shri I. A. Modi: It is not the case with every patent. All the things go simultaneously. Perhaps he may recover the cost within three years. In seven years, he will be able to recoup even extremely high expenses.

श्री चोरड़िया : क्या आपको स्वयं, अथवा आपके किसी मित्र को, ऐसा अनुभव है कि पेटेन्ट कार्यालय में प्रार्थनापत्र देने के बाद कितने वर्ष बाद पेटेन्ट ग्रान्ट किया गया ?

Shri I. A. Modi: We have no experience.

Shri Hasmukhlal C. Shah: It will be better if you suggest in the Bill how quickly the patent should be granted, so that the time factor will not be there.

Shri B. K. Das: You are in favour of Clause 48. That is what you have said in your Memorandum. But no compensation has been provided. Have you any comment to make on that?

Shri I. A. Modi: My only comment is that, after all, the drugs are to be used for national interest. We can give you the example of the U.K. Act here. If it is to be used for government purposes, naturally no compensation is to be given. If such a well developed country wants it to be so, why should we not want it? There should be no compensation if it is used for government purposes.

Shri B. K. Das: Some opinion has been expressed that it should be restricted to Defence purposes, security of the country, epidemic and such other things and should not be applicable for general government use, for instance, in hospitals. What have you to say on this?

Shri I. A. Modi: It should be for public at large and for al' government purposes.

Mr. Chairman: That is all.

Thank you, gentlemen.

(The witnesses then withdrew.)

(The Committee then adjourned to meet again at 17.00 hours)

(The Committee reassembled at 17.00 hours).

III. **Gujarat Vepari Mahamandal, Ahmedabad.**

Spokesmen:—

1. Shri Chandulal Premchand.
2. Shri Charandas Haridass.
3. Shri J. T. Trivedi.

(The witness were called in and they took their seats).

Mr. Chairman: Gentlemen, The evidence you give will be published and given to all our Members and laid down on the Table of the House and also will be given to all Members of Parliament and even if you want any portion to be kept confidential, that will also be printed. We have received your memorandum and if you want to put forth any new points or elaborate any points already made, you are free to do so. Afterwards, our members will ask questions.

Shri Chandulal Premchand: At the outset we would like to express our regrets that we could not come in

time as our train was late beyond our imagination.

We would like to draw your attention to our memorandum. *Clause* 3(*a*): Here, the word 'scandalous' in the old Act is proposed to be substituted by the word 'frivolous'. We fear that the word 'frivolous' may not convey the meaning as is supposed or as is conveyed by the word 'scandalous'. Perhaps the authorities may consider any invention which may seem to be small as frivolous and reject it. The executive authority should be very careful in rejecting an invention and we desire that the **executive power** should be limited to rejecting those inventions which are against morality or society. We have, therefore, suggested for want of any better word that the word 'scandalous' as in the present Act be kept in the bill though we feel that the meaning of the word 'scandalous' is conveyed in clause (b).

Now turning to page 4 of our memorandum—clause 102(3) regarding the compensation for compulsory acquisition of patent by Government, in the Bill discretion has been given to the executive authority to determine the compensation to be paid to the patentee. There is every likelyhood that the officer will use the judgment in favour of the Government and to that extent against the patentee. So we have proposed that there should be an independent board to determine the compensation to be paid to the patentee instead of Government deciding in favour of the Government.

About clause 126, with reference to the practitioners, Mr. Trivedi will explain the position.

Shri J. T. Trivedi: Clause 126 is specially meant for the recognition of patent attorneys. In this context, the idea conveyed is that a man who wants to get himself registered as a patent attorney or a agent should be an advocate and also he should have a degree in science or technical qualifications. These three things are practically not possible so far as our country is concerned. Even Judges in the Supreme Court do not possess engineering and law degrees. Even in other countries you will find that none of the jurors possesses both engineering and law degrees. These two are different subjects altogether. It can't be said that this is a technical subject and a man having no degree cannot possibly practise himself in drawing the specifications of the claim. It is a practical thing. Therefore there should be only this provision that those who are practising in this field should be given recognition. Just like chartered accountants, there should be a training institution for them and thereafter this clause for compulsory degree should be introduced. In U.K. also this system was introduced very late. First persons who were practising in that particular field were granted recognition. After some time, an institution was started to give them training and now they have provided that only those who are well-versed in that particular field through training would be allowed to practise. But in our country we have not got that type of institution so far. Therefore, it is necessary that those who want to practise in this particular field be given a fair chance. We have got a very small number of practitioners in the patents field. It will be hardly 39 or 40 throughout India and looking to the population of the country, this figure is very small and none of these practitioners possesses the degrees that are specified in the proposed Bill. Therefore, my submission is that this provision should be relaxed for some time so that this can be introduced when the proper time comes. For the time being they may be given recognition and after some time a patents examination may be held and if they pass the examination they could be given a certificate to that effect and allowed to continue practice.

Shri R. P. Sinha: What interest do you represent?

Shri Chandulal Premchand: The Gujarat Chamber of Commerce. It represents trade and industry in Gujarat. The members are not located only in Ahmedabad but are scattered all over the important places of Gujarat. The total membership is 2,500.

Mr. Chairman: Have you any pharmaceutical industries on your body?

Shri Chandulal Premchand: Yes, Sir, about 10.

Mr. Chairman: Have you obtained their views about this Patent Bill?

Shri Chandulal Premchand: Yes.

Mr. Chairman: About your other industries?

Shri Chandulal Premchand: We have not been able to obtain their views.

Shri R. P. Sinha: Ahmedabad is a centre of textile industry. Is the textile industry in any way affected by this Bill?

Shri Chandulal Premchand: It does affect, because they are making use of patented articles and they are the users to a large extent of patented processes of foregin patentees.

Shri R. P. Sinha: Then they pay royalties to the foreigners?

Shri Charandas Haridass: Yes, we are paying royalties for example for the Sanforized process.

Shri R. P. Sinha: What is the amount of royalty you pay for the Sanforized process?

Shri Charandas Haridass: About Rs. 50,000 to Rs. 75,000 per month per unit.

Shri R. P. Sinha: The patent belongs to which country?

Shri Charandas Haridass: It is an American company.

Shri Chandulal Premchand: The Sanforizing machine is rented to these people by the patent-holders and per metre of cloth that they Sanforize, they have to pay so many paise as royalty, and it comes to about Rs. 50,000 per month for a medium-sized unit.

Mr. Chairman: How many units are there?

Shri Charandas Haridass: There are 60 units in Ahmedabad. All of them do not use this Sanforized process. Only about 25 mills use it.

Shri R. P. Sinha: Is it possible for your Association to send us some more details as to the quantity of the sanforized textiles that are being produced in the country and the exact amount of royalty being paid. For how many years the patent is their? What are all the terms of this?

Shri Charandas Haridass: Yes, Sir.

Dr. C. B. Singh: One process alone and Rs. 3 crores and 60 lakhs per year?

Shri Chandulal Premchand: Some of the mills have entered into agreement with the British Tootal process. Some of them have started working it. Perhaps, the royalty demanded by the Tootal processors must be higher than the sanforized.

Shri R. P. Sinha: Will you send us the data for that also?

Shri Chandulal Premchand: Yes, Sir.

Shri R. P. Sinha: I would like to know one thing. These Tootals and Senforized must have taken the patent in India.

Shri Chandulal Premchand: Yes, Sir.

Shri R. P. Sinha: I would like you to make sure, whether they are getting the royalty as a patent from the patent that has been registered here or is it a royalty for the know-how and technique that is given or the rent of the machine? We would like to know definitely what is the element of royalty for the payment of the patent rights. You understand my point.

Shri Chandulal Premchand: I will just repeat. You want to know whether this royalty is in compensation for the know-how or the machine or for using the word "Sanforized" on every piece of cloth.

Shri R. P. Sinha: Quite right. If it is something else, then we are not concerned. If it is patent, then we are concerned. Kindly give us the Patent No. We can check up whether it is a perfact patent or not.

Shri Chandulal Premchand: All right.

Mr. Chairman: I am told that the patent period is over. It is only for the trade mark that you are paying.

Shri J. T. Trivedi: Sanforized patent is still in force for the process. That has been patented in 1954. It has about two years to expire. However, I will give the details about this on my return to Ahmedabad.

Mr. Chairman: Please give us the details about both.

Shri R. P. Sinha: Please give us the patent number. Please let us know if there are other types of patents which the textile industry in Ahmedabad are using.

Mr. Chairman: I think the textile manufacturers even in Bombay have to pay this royalty.

Shri Charandas Haridass: Throughout India, Sir. Any mill who wants to us this sanforized process has to pay the royalty.

Shri R. P. Sinha: If we get the details, we can have some idea. We can refer it to the All India Textile Federation.

Mr. Chairman: Can you give us what textile industry in India—including all places, is paying for this trade mark or patent whatever it is?

Shri Chandulal Premchand: I think we shall be able to give it. Through the Federation, we can get all these figures.

Shri J. T. Trivedi: Regarding the sanforized process, Sir, some machines like Eva Set are being manufactured in the U.K. which are available for Rs. 2½ lakhs. In West Germany, the machine known as Manfores is available at a cost of Rs. 2 lakhs, whereas in the U.S.A. we have to pay a cost of Rs. 4 lakh and 50 thousand. That is the position.

Mr. Chairman: Why should they not manufacture in India?

Shri J. T. Trivedi: Tootal & Company have got a contract with the mills likely to expire in 1967. They are trafficking in it and Government has allowed them to take away this large money from our country.

Shri R. P. Sinha: Please differentiate between trade mark and patent. We are not concerned with the trade mark. If this particular machine has got a patent for the manufacture of sanforized products, we would like to know the patent number of this machine. The point raised here is that this patent for this machine has already expired. We would like to know, as you have said, that this machine is available for four lakhs in America and 2 lakhs in West Germany and England and probably because of this patent you can neither manufacture the machine here nor can you import from West Germany. Please send us a comprehensive note on this subject.

And please tell us if there are other patents for products or process that are being used in the industries at Ahmedabad—whether textile or oil or anything else?

Shri Chandulal Premchand: The word "Sanforized" has been so popularised by the patentees or by the holders of the trade mark and the consumer preference has been so much created that textile mills even if they stablise another process almost similar to it, will not fetch that price. At the same time, it will not be so easy of sale, because the manufacturers and the patent holders have so popularised it—they spent lakhs and lakhs of rupees to popularise the word "Sanforized" that textile mills, even if they like it or not, would pay this high royalty. They have to use it and they have to sanforized it.

Shri R. P. Sinha: It is borne out of our own experience. And one thing more. This textile industry is a very very old industry of India and particularly in Ahmedabad. Could you please tell us whether the textile industry in India has taken out some patent in respect of certain processes or something which they can claim as a result of their own experience? Any such innovation?

Shri Chandulal Premchand: Yes. There is one process which is "Trinised", which has been invested by ATIRA, the Ahmedabad Textile Industrial Research Association, whereby the cotton cloth can be processed as to wash and wear. At the same time, it maintains the softness and airiness of the cotton cloth. Others are using synthetic resins to make it "wash and wear" and to avoid ironing. This process has been invented after so many years of research by the chemists of ATIRA, and they have asked for patent.

Shri R. P. Sinha: They have taken the patent in India?

Shri Chandulal Prem Chand: Yes, Sir.

Shri R. P. Sinha: When was it taken?

Shri J. T. Trivedi: It was somewhere in January '65.

Mr. Chairman: Any foreign country has taken the patent?

Shri J. T. Trivedi: I do not remember, but I can furnish this information after my return.

Shri R. P. Sinha: Please give us particulars about the number of cases where they have taken patents for themselves, and whether the process is being used in any of the mills in India.

Shri Chandulal Premchand: Some of the mills in Indore, Bombay and Ahmedabad have started using this process by paying royalty to 'ATIRA'.

Shri R. P. Sinha: What is the royalty paid?

Shri Charandas Haridas: Rs. 7,500 per year.

Shri Chandulal Premchand: That is the minimum.

Shri R. P. Sinha: What do you mean by the minimum?

Shri Chandulal Premchand: It depends upon the use they make on the metre, of cloth but the minimum is this amount.

Shri R. P. Sinha: There must be some royalty based on metre also. Could you tell us that figure?

Shri Chandulal Premchand: We shall furnish that information.

Shri R. P. Sinha: I would like to compare this with the royalty per metre on sanforized cloth. Could you also tell us how many years it took for the ATIRA to evolve this process, and what expenditure they had to incur in order to evolve this process?

Shri Chandulal Premchand: They worked for about three years. The primary function of the ATIRA is to study the problems of the mills which are sent to them for study and then suggest solutions. In addition to that, there were scientists who work on this also; after finding that the consumers want a type of cloth on which they could be saved from the trouble of ironing, they began to work on this, using only the cloth without adding any synthetic resin or any other foreign material.

Shri R. P. Sinha: Kindly send us a note on the function of the ATIRA and what new processes they have tried to evolve, the expenditure per year, and how it is being financed.

Could you tell us about the patents in regard to engineering goods or engineering products?

Shri Charandas Haridass: We have started one factory in Ahmedabad, which manufactures printing machines; they have secured a patent also; and that machine is being sold at present at the cost of about a few lakhs of rupees. It is a special type of machine for vertical printing; it is for printing on cloth.

Shri R. P. Sinha: You have taken a patent for that also?

Shri Charandas Haridass: Yes.

Shri R. P. Sinha: Are you selling it abroad?

Shri Charandas Haridass: Not abroad; but we are selling it in Bombay, Indore and Calcutta.

Shri R. P. Sinha: Please send us some more details showing how much it costs, how it was evolved, the royalty obtained, when this patent was taken etc.

Since you are doing so many things to solve your problems at the ATIRA, and you have also got the problem of royalty, the problem of giving as well as taking of royalty etc., I would like to know whether you have applied your mind to the question of what the period of the patent should be, what royalty should be provided for and so on, so that your interests or the Indian interests are protected both from the point of view of not being exploited by a foreign patentee and also from the point of view of getting protection for your patents here so that you can evolve more new patents for improving the production of textiles and other items here and you could get proper return on the investment that you make in evolving new patents. If you have examined these questions, kindly let us know what your views are.

Shri J. T. Trivedi: In that context, I would like to submit that usually, the grant of a patent takes about a period of three years. After that, the patentee has to set up the machinery for working it, and then organise a market for it and then sell the machine to the prospective clients; the period of 16 years provided for in the present Act has been found to be not sufficient in some cases. In any case, it should not be reduced, and this should be ensured in order that we may recover the amount that is spent on labour, in organising the factory etc.

Dr. C. B. Singh: What is this period of 16 years?

Shri J. T. Trivedi: 16 years is the period provided in the present Act.

In the new Bill it has been reduced to 14 years. That period of 14 years should be from the date of sealing of the patent and not from the date of application, because between the date of application and the grant of the patent, it generally takes about three years; that is the natural course, and that is what we have experienced also. During these three years, one cannot start the factory; one may not get a financier to help one and so on. Therefore, some latitude should be given in this regard, because we are a developing country and we have to develop so many things. In regard to patents for items other than medicines and food articles, the period should not be reduced.

Shri R. P. Sinha: What do you mean by 'financier'?

Shri J. T. Trivedi: The inventor may not have the necessary money and he may have to find out a financier who would assist him to work out his invention, and start the factory.

Shri R. P. Sinha: We have provided for a maximum royalty of 4 per cent. Will that be sufficient, for instance, in the case of the printing machine developed by the ATIRA?

Shri J. T. Trivedi: I have not applied my mind to that question.

Shri R. P. Sinha: Will you kindly consider the question from the angle that I have put before you and then give us a memorandum on that aspect?

Shri J. T. Trivedi: Yes, I would consider it and then give you a note.

Shri R. P. Sinha: If necessary, you can consult your executive committee also and then give us the note.

Shri Chandulal Premchand After consulting the committee we shall be presenting our views before you.

Shri R. P. Sinha: Both on the royalty question and also on the life of a patent.

Shri Chandulal Premchand: So far as the period of ten years is concerned, we have already more or less agreed on that. But on the question of royalty we shall certainly give our views after considering the matter.

Shri B. K. Das: At page 4 of your memorandum you have suggested some further addition to clause 87. You want to add the words 'any substance, method or processes which the Central Government may notify in the future'. I want to know what particular substance you have in mind. Could you give us some idea of that?

Shri J. T. Trivedi: No; in clause 87 we have made out for which particular substances a patent may not be granted after a particular time. In this connection, I would invite your attention to the wording of clause 87. I would like to submit in this context that we have not exhaustively stated the various substances which are there in India which Government may think it proper in the interests of the country to put in this category. Therefore, there should be a provision that at any time Government may notify in the Gazette of India any particular substance as coming within this category, so that the patent may not be granted for that substance or it may be endorsed with the words 'Licence of right'.

Shri B. K. Das: I only wanted to know whether you have any particular substance in your mind except chemicals for which there is special provision?

Shri J. T. Trivedi: For the present I have not anything in my mind but this clause should be kept open and it may cover very many substances.

Shri B. K. Das: You want an independent statutory body like a Board

for fixing up the compensation. What would you like to be the composition of such a Body?

Shri Chandulal Premchand: We have suggested an independent Board, viz., a Board of Trade set up by the Central Government consisting of the nominees of that particular trade for determining such compensation having regard to the expenditure incurred in connection with the invention and in the case of a patent, the term thereof.

Mr. Chairman: You want that there should be a Judge; a nominee of the Trade and a lawyer. Is it so?

Shri B. K. Das: And the Appeal should lie in the High Court.

Shri Chandulal Premchand: Yes, Sir.

Shri Kashi Ram Gupta: On the questions put up by hon. Member, Shri Sinha, you have given very valuable information but the same could also have been put in the memorandum. May I know what prevented you from putting all this information regarding royalties and new inventions in the memorandum?

Shri Chandulal Premchand: We have simply to express sorrow on that account.

Shri Kashi Ram Gupta: You know the Bill provides a rate of royalty on percentage basis. Now you have informed us that royalties are taken per meter. How the two are to be reconciled?

Shri Chandulal Premchand: For sanforized cloth it is on the meter.

Shri Kashi Ram Gupta: When the patent is granted the clause on royalty is on percentage basis. Then naturally they should conform to that only. How it can be on meter basis?

Shri Chandulal Premchand: We are stating a fact how royalty is demanded when a contract has been entered into between the owner and the user.

Shri Kashi Ram Gupta: My request is you should see to the patent conditions also whether the patent conditions are putting down rate of royalty on percentage basis or meter basis?

Shri Chandulal Premchand: We shall enquire and submit that information.

Shri Kashi Ram Gupta: Now, you know this Bill provides 14 years following from the date of completion of specification. I want to know what is the practice *i.e.* whether machinery industry generally give their applications with complete specification or it takes time to complete the specification.

Shri J. T. Trivedi: Usually they do not file complete specification at the time of filing the application. They file the application provisionally in most of the cases. Only in few cases they put in application along with complete specification.

Shri Kashi Ram Gupta: Therefore, according to the new Bill the period naturally comes to about 15 years because it is from the date of completion of the specification.

Shri J. T. Trivedi: That is, no doubt, correct, Sir, but even after submission of complete specification there will be examination, etc. which will take time.

Shri Kashi Ram Gupta: That is covered by 14 years. In the old Act it was from the date of filing and now it is from the date of complete specification.

Shri J. T. Trivedi: That I do agree.

Shri Kashi Ram Gupta: Have you consulted the pharmaceutical industry about 10 years period or not?

Shri J. T. Trivedi: I have not consulted.

Shri Kashi Ram Gupta: Finally, have you anything to say about the clause regarding revocation?

Shri J. T. Trivedi: No, Sir, I have not got anything to say.

Shri Kashi Ram Gupta: Do we take that other clauses of the Bill are agreeable to you?

Shri J. T. Trivedi: Except the few points I have mentioned and submitted in the memorandum sent by the Mahamandal.

Shri K. K. Warior: I wish to know from the hon. witness how many patents held by foreigners have come in the way of our developing the process of textile industry in India?

Shri J. T. Trivedi: As a matter of fact I have not come across such cases personally but I know that so many patents come in the way because our country is a developing country and most of the people look to the foreign stuff and when we develop that idea and go in for a patent we are not allowed because already these are lying on the shelves of the Patent Office and it amounts to prior publication and, as such, so many foreign patents come in our way. But we cannot give exact number and idea about them.

Shri K. K. Warior: How many patents infringement cases have been there in the textile industry to your knowledge?

Shri J. T. Trivedi: As a matter of fact only one case was filed in 1961 regarding an infringement of a spinning machinery under the patent.

Shri K. K. Warior: Whether any of the patent right held by foreigners has come in the way of developing our textile machine building industry?

Shri K. K. Warior: How far the textile industry as such is spending out of their resources for research in textile technology? What percentage of the turnover?

Shri J. T. Trivedi: That is not practically possible for us to say. As far as I know, the Ahmedabad Textile Industry Research Association is carrying out research on behalf of the textile industry, and they are assisting the people. Information can be obtained and supplied.

Mr. Chairman: You have some textile institute in Bombay?

Shri Charandas Haridass: Yes, Sir.

Shri K. K. Warior: Have you fixed any percentage of the turnover?

Shri Charandas Haridass: The rate is based on loom basis with every mill. The average is Rs. 3000 per year for an average unit.

Shri K. K. Warior: Only the weaving mills have to contribute?

Shri Charandas Haridass: No, Sir. Both the weaving and spinning mills have to contribute.

Dr. C. B. Singh: When on one item alone Ahmedabad is paying Rs. 3 crores and 60 lakhs, I am sure the Ahmedabad Mills must be using certain chemicals and dyes also—I am sure about it, and this, too, must come to a fairly big amount.

Shri Chandulal Premchand: All the mills are not users of sanforized. Only those which are producing superfine and fine cloth—mostly superfine cloth—are using sanforized.

Dr. C. B. Singh: How the figure of Rs. 3 crores has been arrived at?

Shri Chandulal Premchand: That calculation is not correct. We can collect that information and submit it.

Dr. C. B. Singh: What about chemicals and dyes? I am sure every mill is using lot of chemicals and dyes in bleaching processes and all that? Have you any idea about it, or will you like to give any information about it?

Shri Chandulal Premchand: They are all using dyes and chemicals. There is no patented process for which they are paying. Even for bleaching, sizing and proofing the processes are well-known. They are using the average colours made by ICI, IDI, etc.

The Ahmedabad Mills are using lot of dyes.

Dr. C. B. Singh: When you send information, will you please send it about these dyes, etc., which are being used largely?

Shri Chandulal Premchand: Yes, Sir.

Mr. Chairman: Sanforize is only for the trade-mark.

Dr. C. B. Singh: That information they will send. It may be so.

Shri Chandulal Premchand: Lakhs of rupees are spent for advertisment to create a graze and preference by the consumer.

Dr. C. B. Singh: Just like Aspro.

Shri Chandulal Premchand: We shall send information on this.

Shri Charandas Haridass: Only the word "sanforised" is very important to our consumer.

Shri Chandulal Premchand: The hon. Member has given the analogy of Aspro. Though other companies are making the same thing and marketing under different names, Aspro is selling more than all the other combined because of their high pressure advertisement campaign.

Shri K. K. Warior: That does not mean that there is no such thing as Anacin or Saridon. They can also spend on advertisement for their own product. Why should they not risk that?

Shri Chandulal Premchand: Advertisement and the effects of advertisement are to a large extent a gamble. For instance, Alembics have been advertising Rubex against Vicks Vaporub and during the year they have spent perhaps more than Rs. 7 lakhs, but the sale of Vicks has not been affected at all. Instead, they have recently created a factory spending Rs. 65 lakhs for manufacturing the four Vicks products.

Dr. C. B. Singh: As you seem to know about this subject so much, can you tell me whether there is any substance in the common complaint that the cost of patented drugs is very high as compared to other drugs in the market?

Shri Chandulal Premchand: This question has been discussed in detail by Mr. Justice Ayyangar in his report. I do not think we should dwell on that.

Shri A. T. Sarma: You said you wanted "frivolous" to be substituted by "scandalous", but even then you will be allowing the same discretionary power to the executive, and they will have to find out whether it is frivolous or scandalous.

Shri J. T. Trivedi: As a matter of fact, "scandalous" should not be maintained on the statute-book, and "frivolous" should also be removed because it has no clear meaning. For example, I have a patent for a screw wherein the only modification is a supporting tongue which holds the screw in its own slot. Such simple inventions might be rejected by the administrative officer if the word "frivolous" is there in the statute.

Shri Chandulal Premchand: The dictionary meaning of "frivolous" is "of no value, insignificant". Judges always go by their own experience and sentiments of life, and if the invention of the screwdriver mentioned is presented for patent, it

might be considered frivolous and rejected though it may be very useful to a mechanical shop by way of saving labour.

Mr. Chairman: Where is the word "scandalous" used? Why do you bring it here?

Shri J. T. Trivedi: It is not used. I correct myself.

Mr. Chairman: "Frivolous" is used in many Acts, including the 1949 U.K. Act which is the current law there, and we adopt it. Why should you object?

Shri J. T. Trivedi: Here, the question is about defining an invention. If the invention is considered frivolous, naturally he cannot obtain a patent for it. That is the object.

Shri A. T. Sarma: You are prepared to have both!

Shri Chandulal Premchand: We are not in favour of the word "scandalous." We do not like to read it either.

Shri Shyamnandan Mishra: ATIRA, to my mind, offers a very hopeful example of joint research which can be imitated by other industries too. You have said that there is a similar research body in Bombay. We have in other countries, as for example, in the United Kingdom, BESRA which is doing research for a joint group of companies. Could you tell us that there are possibilities of this kind, for joint research, so far as other industries are concerned, because the financial arrangement also in the case of ATIRA is very tempting; 50 per cent is contributed by the Government and 50 per cent by the industry. Have you explored the possibilities of joint research so far as other industries under your care are concerned, or, could you offer some advice in this respect?

Shri Chandulal Premchand: That has not come up yet.

Shri Shyamnandan Mishra: My second question is this. So far as sanforized method is concerned, I would like to know whether it is liked by the indigenous consumers or it is liked by the foreign consumers.

Shri Charandas Haridass: Both. In export also that is mentioned.

Shri Shyamnandan Mishra: Could you roughly indicate the proportion as to what extent they are used by indigenous consumers?

Shri Charandas Haridass: Formerly we used to export our cloth in great varieties much more than the sanforized variety. Recently, the Government of India has changed its policy and has given more incentives for sanforized varieties. So, it is in the initial stages, and hence I cannot give any opinion on it.

Shri K. K. Warior: Formerly other varieties were being used in much greater quantities. Now, the Government policy is to encourage sanforized cloth so that royalty will be more. That is what he is saying.

Mr. Chairman: Is it because you have an export market for sanforized varieties?

Shri Chandulal Premchand: In some Asiatic countries and in some European and other countries.

Shri R. P. Sinha: Could you tell us what proportion of sanforized cloth is exported?

Shri Chandulal Premchand: We cannot give it.

Shri R. P. Sinha: Will you be able to send us the figures later?

Shri Chandulal Premchand: Yes.

Shri Shyamnandan Mishra: May I know whether ATIRA has got any

collaboration arrangements with any research body in foreign countries.

Shri Chandulal Premchand: Not in foreign countries. But there is an exchange of information with research institutions like those existing in Bombay and Calcutta. There is no foreign collaboration.

Shri Shyamnandan Mishra: They do not have any arrangement for the exchange of ideas with foreign institutions?

Shri Chandulal Premchand: There is an exchange of ideas among such institutions in Bombay, Calcutta and Ahmedabad.

Mr. Chairman: I am told by the Chief Controller of Patents that the CSIR is prepared to meet half the expenditure and also the initial expenditure for any other institute started by another industry in India for research.

Thank you, gentleman.

(The Committee then adjourned).

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965.

Thursday, the 14th July, 1966 at 09.30 to 17.10 hours.

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Shri Peter Alvares.
3. Shri Ramchandra Vithal Bade.
4. Shri Panna Lal Barupal.
5. Shri Bibhuti Mishra.
6. Sardar Daljit Singh.
7. Shri Basanta Kumar Das
8. Shri V. B. Gandhi.
9. Shri Kashi Ram Gupta.
10. Shri Madhavrao Laxmanrao Jadhav.
11. Shri Mathew Maniyangadan.
12. Shri Bibudhendra Mishra.
13. Shrimati Sharda Mukerjee.
14. Shri Chhotubhai M. Patel.
15. Shri Naval Prabhakar.
16. Shri R. Ramanathan Chettiar.
17. Shri Sham Lal Saraf.
18. Shri A. T. Sarma.
19. Dr. C. B. Singh.
20. Shri K. K. Warior.
21. Shri Balkrishna Wasnik.

Rajya Sabha

22. Shri Arjun Arora.
23. Shri Vimalkumar M. Chordia.
24. Shri D. P. Karmarkar.
25. Shri P. K. Kumaran.
26. Shri Shyamnandan Mishra.

27. Shri Mulka Govinda Reddy.
28. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*
3. Dr. A. Joga Rao, *Controller General of Patents, Designs and Trade Marks.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMEN

1. Shri V. N. Bhatia, *Joint Secretary, Legislative Department, Ministry of Law.*
2. Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Pharmacy Council of India, New Delhi.

Spokesmen:

1. Dr. S. Rohatgi.
2. Dr. P. K. Sanyal.
3. Dr. S. B. Rao.
4. Shri Devinder K. Jain.

II. Federation of Indian Chambers of Commerce & Industry, New Delhi.

Spokesman:

1. Shri Ramanbhai B. Amin—*President.*
2. Shri L. S. Devar.
3. Shri C. H. Desai.
4. Shri N. Krishnamurthi.

III. Dr. V. B. Chipalkatti, *Director, Shri Ram Institute for Industrial Research, Delhi.*

IV. Business Council for International Undertaking, *New York.*

Spokesman:

Mr. Robert Meagher.

I. Pharmacy Council of India, New Delhi

Spokesmen:

1. Dr. S. Rohatgi
2. Dr. P. K. Sanyal
3. Dr. S. B. Rao
4. Shri Devinder K. Jain.

(The witnesses were called in and they took their seats)

Mr. Chairman: If you want to stress any point in your memorandum or add any new point, you may do so.

Dr. S. Rohatgi: On behalf of the Pharmacy Council of India, I think you for giving us an opportunity to appear before you.

The Pharmacy Council of India is the seniormost statutory body under the Pharmacy Act. We have under the Pharmacy Act State Pharmacy Councils in each State and the Pharmacy Council of India is composed of one member elected by each State Council and one representative from each State Government along with 6 members from the Inter University Board and 6 representatives nominated by the Central Government. Apart from that, we have a few *ex-officio* memoers like the Director General of Health Services, the Drug Controller of India etc. We have 43 members in all. There is a slight variation in the number for the simple reason that all the States have not yet formed State Pharmacy Councils.

We regulate the profession of pharmacy. In regulating the profession, the major stress is on education. We lay down standards for education in pharmacy. We have our inspectors to inspect all the courses in pharmacy throughout the country, and it is only on the basis of the approval given by this Council that Pharmacists can register themselves in the register of the State Pharmacy Councils and practise pharmacy.

The first point which I would like to stress relates to the definition of intermediates. As the definition stands at present, it might include a very common basic chemical like sulphuric acid and what not. So, we suggest that the term "intermediate chemicals" might be defined a little better. For instance, it can mean chemical substances directly or exclusively used in the synthesis of the compound and it would not include chemical reagents or substances of that nature. As we understand it, the reason why this particular sub-clause has been included is to prevent circumvention of certain provisions. That could be done by a clearer definition of intermediate substances.

In Clause 5 we have suggested that the following may be added at the end:

> "Provided that the method or process of manufacture is a substantial improvement over known methods or processes."

This would help preventing useless processes from being patented.

In regard to Clause 73(2) we have suggested that a panel of experts or a technical advisory board may be set up. The reason is this. In the past it has been seen that many processes which have been published in scientific literature or in old text books of chemistry have been patented in this country. We have made some provisions in the Bill for enlarging the Patent office especially with regard to technical assistance to advise the Controller, but we feel that specialisation in narrow fields has been going on to such an extent that it is not possible for a small group of experts to advise in all branches of learning. It is therefore desirable that we have a panel of experts to advise the Controller whether a particular process has been mentioned elsewhere in scientific literature and is not capable of being patented.

Mr. Chairman: That is what the clause proposes to do. It may appoint some officers: "as many examiners and other officers and with such designations as it thinks fit for the purpose of discharging, under the superintendence and directions of the Controller, such functions of the Controller under this Act as it may from time to time authorise them to discharge."

Dr. S. Rohatgi: My submission is that this relates only to the appointment of technical advisers or experts in the office of the Controller. I may say that research has been progressing in certain fields at such a space that it is not possible even for quite a large number of experts in the Patent Office to know all about the progress that is taking place in that particular field. We have specialists in the country, working in various national laboratories, and various other bodies, from where we could draw a panel of experts to form an advisory body which will be able to advise the Controller on the latest developments in that particular field. I submit that a number of technical experts in the Patent Office may not be able to satisfactorily discharge this function.

Mr. Chairman: I think that is provided in the Bill.

Shri K. V. Venkatachalam: Clause 73(2) refer to the appointment of officers in the Patent Office. His suggestion is that an outside body should be consulted.

Dr. S. Rohatgi: The last point which we want to stress was that in case a particular process is to be exploited by a public sector undertaking which, as we understand, is a profit-making body, it would appear to be in the fitness of things if royalty is paid by the users of the patent. If the Government themselves were to utilise the patented process, it would be all right, but if the public sector undertaking were to utilise it, they might either pay a royalty or, as we have suggested as an alternative, they should agree to sell the produce at a no-profit-no-loss basis. It would then be quite in order.

Dr. C. B. Singh: With your experience as a pharmacologist and as a teacher in pharmacy and now as representing the Pharmacy Council of the country, would you like to comment on the fact that there is a complaint that the cost of patented drugs in this country is very, very high?

Dr. S. Rohatgi: I would like, with your permission, to dilate on this particular point a little more than the question itself relates to. The point raised is whether the patent provisions as they stand today have led to an increase in the price of drugs. I would like to say a little more on the price of drugs as such, and mention the reasons why some drugs are more expensive in this country. There seems to be a considerable amount of conclusion about the price of drugs in this country. I would like to say very emphatically here that not all drugs manufactured or sold in this country are more expensive or are exorbitant, as compared to the prices in other countries. Certain groups of drugs by all means are very expensive. We have for example a large number of Galenical preparations or simpler preparations which are being made in a competitive manner by a large number of firms and the prices of these drugs, I dare say, are not higher than the international prices for these drugs in other countries. On the other hand, where monopoly or cartels have been set up, the price of drugs is certainly very high. This needs more elaboration because we might consider how monopolies are set up. The first question raised by the hon. Member, Dr. Chandrabhan Singh, is with regard to the patent provisions. The patents do set up a kind of monopoly and that monopoly is being abused in this country and the prices of these drugs are

certainly very much on the higher side. The second reason is the menopoly set up by the licensing policy and the implementation of the Industries (Development and Regulation) Act, where the manufacture is confined to one or two or at the most three firms, and where the prices of these drugs have been kept very high. Apart from all these considerations there is another factor, and that is, the cost of some of the basic materials which go into the manufacture of drugs which are used by the drug industry is higher here than in countries of the west.

Dr. C. B. Singh: I would like you to elaborate this point; that the cost of certain raw materials which go into the production of these pharmaceutical drugs is higher in this country as compared to other countries. This is an important point and I would like you to deal with it in a more detailed way.

Dr. S. Rohatgi: We have to import certain chemicals. As for example, for certain acids, such as sulphuric acid, we have to import sulphur because it is not indigenously produced or available in the country. So, the cost of sulphuric acid is higher here than what it is in some other countries in the west.

Mr. Chairman: By how much?

Dr. S. Rohatgi: It would be in the region of 30 to 40 per cent. This increase does reflect to a certain extent on the cost of production of the active substance in bulk. It is interesting to observe here that whereas some of the items which are used as raw materials in the production of bulk material cost higher, wherever the medium and small scale industries are engaged in processing the drug, the selling price of the finished drug in the finished dosage form is not in anyway higher or appreciably higher than in other countries of the west. This increase is more or less absorbed by the processing centres in the industry. The main thing is, as we see it, that wherever competition has been set up, the prices of drugs find a national norm or level. It is not a matter of control but due to national competition that the prices come down.

Mr. Chairman: Admitting that the cost of raw material is higher, as in the case of sulphuric acid, does it in anyway justify the increase of cost by 800 or 900 per cent?

Dr. S. Rohatgi: Definitely not.

Mr. Chairman: I can understand a rise of 40 to 60 per cent, but does it justify an increase by 700 to 800 per cent?

Dr. Rohatgi: But that higher cost is not there in all cases. In some cases of ingredients, it is higher. In many other cases it is not higher. So, it definitely does not justify an increase of 800 per cent as mentioned by you.

Dr. C. B. Singh: A great amount of litigation has been going on in the country about five or six patented drugs like streptomycin, chloropheniçol, tolbutamide, etc. In all these cases the country has suffered very badly and the patent-holders have profited at the cost of the health of the people of the country. That is your view about this matter?

Dr. S. Rohatgi: The case about chlorempheniçol is well-known. Chloromycetin was sold in this country at a fantastic price and the cost of treatment of a typhoid patient used to come to Rs. 60 or Rs. 70. But when the Italian material came in the market, the prices crashed. This is a specific example of abuse of patents.

Tolbutamide is also interesting. I understand several firms in India were interested in manufacturing this, but the provisions of compulsory licensing as they exist under the present Act made it extremely difficult for them to get a licence. So are the cases of other sulpha drugs like

sulphathiozol. The present Bill very rightly confines the patent to the process. A British firm wanted to manufacture this item also and when two big international concerns were confronted with each other and litigation was pending; I have very definite information that they came to a settlement amongst themselves to keep the market to themselves, keeping others out. That is how cartels are formed.

Dr. C. B. Singh: Suppose you intended a product and you are faced with the problem of protecting your right of that product being used by you because you have spent a lot of money on the research, etc. If in another country that product was being surreptitiously produced, what will you do about it?

Dr. S. Rohatgi: If am a scientific worker and I discover a new drug, if that drug is going to be used by a lot of people the world over, I would be quite happy provided I get some recognition for it. That is lacking in our country. If I develop a new drug, what is most likely to happen as a result of the present licensing policy is that I will be faced with competition from some firms in advanced countries with a backing of 100 years and they will see that my venture does not prosper. The profit-making part is that of the capital investor not that of the scientific worker. Of course the scentific worker would like to have a certain amount of remuneration for what he has been able to discover, but he would not like to exploit it to the maximum advantage by charging excessive profits and preventing people from being able to use it.

Dr. C. B. Singh: There is a feeling that the prices of patented drugs have gradually gone down during the last five or six years in this country and even internationally. Do you agree?

Dr. S. Rohatgi: That cannot be said as a general rule. Prices of some patented drugs have come because of certain imports from cheaper sources abroad.

Dr. C. B. Singh: Prices of most of the patented drugs have gone down. Does the same thing hold good about other non-patented prescription drugs?

Dr. S. Rohatgi: I think the comparison is not very fair for the simple reason that we are comparing a class of drugs where the profit margin is very high and another class of drugs where more than hundred or even two hundred firms are manufacturing them at a very low margin. Therefore, the question of drop in prices in the case of those drugs very rarely happens.

Dr. C. B. Singh: More than 90 per cent of the drugs used in prescriptions are non-patented drugs. Do you agree with this statement? If so, could you tell us whether price of these non-patented drugs has remained stationary, it has gone up or it has gone down?

Dr. S. Rohatgi: The prices of drugs which are non-patented and which are being manufactured by a large number of firms in this country are more or less stationary and, if anything, they have also gone down in many cases.

Dr. C. B. Singh: I would like the Patent Officer to get these figures if possible. Now, there is a feeling in the country that hardly any research worthwhile has been done as far as drugs and pharmaceuticals are concerned in this country. Would you like to comment on that?

Dr. S. Rohatgi: Generally a comparison is made between India, which is a developing country, and countries which are very highly developed. We have certainly not been able to produce anything very spectacular in the nature of new drugs because of the very simple reason that we have at the moment to manufacture a large number of drugs which are being

made elsewhere and consumed in our country. So the first step we have to follow is to start manufacturing all those drugs, which will be more of a development programme rather than a original research programme.

Dr. C. B. Singh: What is your suggestion in the matter of discovery of new drugs as far as this country is concerned?

Dr. P. K. Sanyal: The drugs that we use are of four kinds: allopathic, unani, ayurvedic and homoeopathic. When we talk about the drugs belonging to the allopathic system, we know that the medicines used in this country under the allopathic system should be known as "European system of medicine". Because these medicines are coming from Europe, any drug that is discovered in Europe comes to India and it is being utilised by modern physicians. I do not know whether we can add even a single drug in the pharmacopoeia at all today. As Dr. Rohatgi has said, what we are trying is to make those drugs which have been made in other parts of the world. In the field of new chemo-therapeutic drugs certainly we have not done anything. Perhaps it will take years and years before we can add anything which the medical profession will take. I do not know how much time it will take for this country to produce such a new drug.

Mr. Chairman: I do not think it is correct.

Dr. S. B. Rao: I would like to classify pharmaceutical research into two: applied research and pure research. So far as we are concerned, today we are confronted with a special problem. We have got to be self-sufficient in our drugs. There are certain basic drugs which will stand for quite sime time. In this programme of development of the processes, relying more and more on indigenously available raw materials, plants and the local environments, they form a very important piece of research which is very peculiar to this country, because we are working under our own conditions The first and foremost thing about this kind of applied research, which this country has certainly been doing for quite some time in the past, is that we have to achieve a substantial amount of progress in this field.

Dr. C. B. Singh: You have stated that there is progress in the discovery of new drugs in this country.

Dr. S. B. Rao: No, I only submitted that we have made some progress, substantial progress, in developing processes for the existing drugs which are known to therapy today.

Dr. C. B. Singh: We are talking of discovery of new drugs.

Dr. S. B. Rao: That is the second part. Even there India has contributed at least one new drug.

Dr. C. B. Singh: That we know, *urea stibamine.*

Dr. S. B. Rao: It was discovered in much worse circumstances. Although our contributions may be small, let us not forget that invention is a matter of luck. After having done so many years of research it is a matter of luck that one comes across a new drug which is really worthwhile and useful in therapy.

Dr. C. B. Singh: Has this drug been patented?

Dr. S. B. Rao: I think not.

Shri D. P. Karmakar: It has come to the notice of the Committee that because of the working of patents some of the manufacturers have been charging extortionary prices. Would you agree that a composite advisory committee, representing Government, the pharmaceutical industry and the consumers would serve

a useful purpose by keeping down the prices?

Dr. S. Rohatgi: I think it is laudable suggestion. I have heard from Government circles that a Committee or cell is going to be set up. I have a feeling that unless people who are really concerned or connected with the industry also participate, it cannot function well.

Shri Arjun Arora: On price of drugs you have stated that they are not uniformly high; in some cases they are high and in some cases they are not. Apart from the cost of import of raw materials, is there any other reason for the prices of certain drugs being high in India?

Dr. S. Rohatgi: The position is that we can easily divide the drugs into two categories. Drugs like common tinctures and galenicals or other common drugs manufactured by a large number of firms are definitely not high priced. Their prices compare very favourably with the prices prevailing in other countries of the world. Then there are drugs in the other category which are high priced. The main reason is the setting up of monopolies whereby they could keep the prices on the high side. One of the reasons which has contributed to an appreciable extent for this increase is the existence of product patent. It has led to a lot of abuse. So, the provision to have a process patent is a desirable step.

Shri Arjun Arora: Could you suggest any steps to bring the prices down?

Dr. S. Rohatgi: We should review the policy under the Industries (Development and Regulation) Act. It should be our policy for the purpose of attaining self-sufficiency in drugs to manufacture most of the drugs in India. The development of manufacture is rather a tedious process. We start from the laboratory scale experiment. If it is successful after considerable effort, we bring it to the pilot plant and then take to manufacture. All this requires considerable expenditure of time and money. If the policy is so enunciated and implemented that we are determined that most of these items will be manufactured by us in the country, as has been done by the Soviet Union, I see no reason why we should not be successful in doing it. We have the ability and resources. If we cannot do something today, we can try hard enough so that we can do it tomorrow or the day after. I have seen cases of this nature in the Soviet Union and Japan. If a particular person or firm develops a new item, they are recognised by the State as having made a definite contribution to the economy and the development of the industry in the country. It is very important that protection is given to those pioneers at least for a certain length of time so that they can come up. Then, after a few years, certainly we can introduce competition from abroad, if necessary, to see that healthy competition exists. That would be my humble suggestion.

Shri Arjun Arora: You have stated that there are cases in which the industrial licensing policy has acted as a disincentive to scientific research in India. Could you mention one case to substantiate this statement?

Dr. S. Rohatgi: It is a little awkward for me to state because I have had, the occasion of experiencing it. I would not like to give the details of the case. I would briefly outline how things move. In the development of active substances derived from medicinal plants, which happened to be my field of study. I made quite a study of what are the requirements of the country and in relation to the particular plants which are not growing whether they could be introduced here. Many a time it happens that we have a particular specie of the plant growing indigenously whereas that plant is not the best source of that active substance

and we have to introduce a new plant in the country. So, the introduction of a new plant, analysing the active substance in very minute quantities from each plant and crossbreeding, improvement of strains and thereby developing the cultivation is a very lengthy process which takes anywhere up to 7, 8 or 10 years.

Having done that, the next step is the development of the process of isolation of the active principle and many a time one is tempted in an effort to do everything in the country, to design the plant itself to set up the manufacture here. That position was attained and the firm I was advising and erected a plant to meet the entire needs of the country for that particular life-saving substance. However, within a very short time, before regular large-scale production could be set up on sound lines, two foreign firms, who so far had made no effort whatsoever to set up manufacture and were conveniently importing the active substance and processing it in India, obtained a licence for manufacturing very large quantities which were five to ten times the average import figures of the country during the last three years. The reason given later on, when I talked about this, was that they intended to export. It was really surprising for me to hear that because permission had also been given to these firms to import the medicinal plant itself which had been successfully grown here. It was difficult for me to imagine how, after importing the plant, one tonne of which yields one kilogram of the active substance, it could be processed in India and exported on a competitive basis. Over and above that, royalty was given to the parent firm. It was very difficult for me to understand that when a process had been developed in the country why should royalty be paid by the country to a foreign firm.

Nevertheless, this is merely an example; perhaps, it may not be a general policy. But I got the feeling that the implementation of the Act needs to have a different orientation so that our scientific workers get due encouragement and do not get discouraged. At the moment it appears that it is more advantageous for any firm in India to enter into a collaboration with a foreign firm rather than do it the hard way. I certainly would recommend that we should have a certain amount of determination and be prepared to do it the hard way just as the foreign firms have done. Why should we be afraid of it .and not follow the same procedure so that we shall have a very firm base and shall be able to stand all kinds of international competition and build a sound export market? It is not by purchasing limited know-how that we can develop a sound industrial base, but we need to develop all this know-how ourselves. It is a painstaking and time-consuming process. If we are thinking from the long-term point of view of development of industry in this country, it seems to me to be the only way.

Shri A. T. Sarma: I find that you are interested in other systems of medicine also. A number of Indian drugs have been incorporated in the British Pharmacopoeia. Do you think that these Indian drugs should be patented so that India would get royalty for them and benefit thereby?

Dr. S. Rohatgi: First of all let me make it clear that we in the Pharmacy Council do not distinguish between different systems of medicine. We are concerned with the pharmacy part of it. So. we are very happy to deal with the question posed by you. Our answer to this question would be that merely the introduction of a medicinal plant in the pharmacopoeia or the use of that plant does not necessarily entitle it to be patented. The difference lies between the approach in the two systems of medicine, that is, the western system and the ayurvedic system. In the ayurvedic system we are not actually isolating the active principle but we are

using either the whole drug or an extract of the drug which contains a number of constituents. All these constituents or at least most of them, are apparently contributing to a certain extent to the therapeutic activity of the drug. In the modern system, if you want to patent it in some foreign country, you must be able to bring the drug in such a form that it could be used by them. The specific example I would give is the case of Rauwolfia. Rauwolfia is being used in this country for centuries, but we could not patent Rauwolfia or an extract of it. However, when Reserpine was isolated, it was a specific case for patenting because reserpine brought in that form, after all the pharmalogical and clinical trials, was a drug which was capable of being used by the modern system of medicine. So, if we bring any of our drugs by carrying out research to that level, we certainly can and should try to have it patented elsewhere.

Shri A. T. Sarma: The Bengal Pharmacy Council has produced so many Indian drugs and they are being accepted by allopathic doctors. They have been included in the British Pharmacopoeia also. They are in use and there is a market for those drugs. Why should they not be patented by the Bengal Pharmacy Council?

Dr. S. Rohatgi: Perhaps I have not been able to make myself clear. In order to have a patent for a drug in a foreign country we should be able to carry out research to suit their requirement and then offer the material to them so that it could be used there. Merely having a patent does not help us. If, for example, we are able to isolate the active principle from the medicinal plant and are able to carry out all the pharmalogical and clinical work on it, we can certainly go ahead and patent it in foreign countries. An example of this nature can be given of certain drugs which have been worked out by the Central Drug Research Institute at Lucknow. They have worked on a number of plants. Recently, I remember, cissampelospareira was being mentioned; another is Babchi. The active principle of Babchi has been isolated by the Central Drug Research Institute. They carried out a considerable amount of work on the treatment of leucoderma.

Shri R. P. Sinha: You gave a very interesting case just now in reply to my friend Shri Arora's question. You referred to one medicinal plant. What is the name of that substance?

Dr. S. Rohatgi: The plant is Digitalis lanata. What we have in this country is Digitalis purpurea. But the active substance of this plant is not used in our country. It is used in America. We have derived inspiration from U.K. and we use Digoxin the source of which is lanata.

Shri R. P. Sinha: Your process has not been utilised at all and the foreign firms are still importing it.

Dr. S. Rohatgi: I am still working on it and manufacturing it.

Shri R. P. Sinha: I would like to know what we can do in order to give incentive and protection in this Bill to people like you.

Dr. S. Rohatgi: To an ordinary worker, the thing of greatest interest is that the development which he works out is given a good opportunity to be used in the country.

Shri R. P. Sinha: What can we do here?

Dr. S. Rohatgi: For example, a product has been developed the hard way without any foreign help. Then, at least for a period of 5 years, it should be given an opportunity to establish itself.

Shri R. P. Sinha: Do you like some separate chapter to be incorporated in this Patents Bill to deal with such new substances which are being discovered by Indians or anybody else in India?

Dr. S. Rohatgi: I do not think that this would be the purview of the Patents Bill. This is more the domain of the Industries and Development Regulation Act.

Shri R. P. Sinha: We are not concerned with that. We are only concerned with the Patents Bill. If you want us to do something here, you can tell us.

Dr. S. Rohatgi: What we have suggested is that the Indian scientific worker takes much longer, due to various difficulties, in establishing or bringing his research to commercial production. Whereas the period of 10 years may be quite reasonable for the well-established industries in the West, it might in certains cases be a little short for the Indian research worker. We very hesitatingly mentioned in our Memorandum that it might be considered that the Indian scientific worker developing a process indigenously might be given a longer protection. On the other hand, we felt that this would amount to discrimination. We do not want to press for it.

Shri R. P. Sinha: That you leave to us. You tell us what you want us to do whether there is discrimination or not. Leave that to us. What I understand from you is this that the period of 10 years is going to help the well-established foreign companies who are financially and technically better placed than you are and that this period of 10 years is going to hit hard the people like you. We are prepared to discriminate, if necessary, so that you get adequate protection. We are prepared to consider that.

Can you tell us what are your difficulties and what you want us to do to help you? If you have not thought over it, you may kindly send us a note on that.

Dr. S. Rohatgi: All right.

Mr. Chairman: Are you for the abrogation of patents so far as drugs and foodstuffs are concerned?

Dr. S. Rohatgi: In fact, we have not considered this. But we feel that in the present context of things, it would not be harmful to us. It will be of advantage to us to abrogate the patents on drugs and foodstuffs.

Shri Bade: There are some restrictive provisions in the Bill and afterwards they will become more harmful to our indigenous patentees also. Do you think that just like in U.S.S.R. where there is a system of authorisation certificate, that certificate is given by the Government and the Government purchases it and utilises it and exploits it, there should be that system here?

Dr. S. Rohatgi: I think that particular method might not be very much applicable here. Ours is a mixed economy as it exists today. In the Soviet Union, whatever is developed is manufactured in the projects which are owned by the Government whereas here we have projects which are run by the Government and also by the private enterprise.

Shri Bade: The Government purchases it and gives the award to the inventor and they, in return, select some other private company to utilise it.

Dr. S. Rohatgi: How will that in help in India? I do not see how it will be of any assistance.

Shri Bade: Because that will give some incentive to the inventor. In the model law also, same recommendation is given.

Dr. S. Rohatgi: I am doubtful whether that will really lead to any advantage. If the patented process is really something which is commercially advantageous, it will pay without any award or any payment by the Government. If the Government purchases a process which does not turn out to be commercially feasible, the Government would have spent money for something on which they need not have spent it.

Shri Bade: There is a provision of compulsory licensing in the present Bill. In the existing Act also, there has been a provision of compulsory licensing. May I know why our industrialists and traders have not taken advantage of that provision?

Dr. S. Rohatgi: I have had one or two cases told to me by certain Indian firms who tried to get a compulsory licence for an injectible iron preparation and it took them three years of litigation but they could not get it and eventually when they did get it, they lost interest. I feel that the provisions, as they have been modified in the Bill, making it easier for the Indian party to get a compulsory licence, are beneficial and of interest to the industry in the country.

Shri Bade: When specifications are filed by the applicant, according to you, they should be examined by the Controller himself. But here is a provision in the Model Law that they should be sent to some other countries for examination.

Dr. S. Rohatgi: Let me explain that again. The position is that scientific research has become so very specialised that one scientific worker concentrates in rather a narrow field. We have experts like that in various fields in the country. It would be useful if the Controller is advised by a panel of experts who could be drawn from various scientific men in the country. That was my suggestion. The decision has to be taken by the Controller, but he should be given correct information about the available printed information in literature, about the progress that is made, about the validity of a particular process for being patented and all this information can easily be given by the panel of experts which I have suggested.

Shri Bade: In the Model Law it is said that the examination of the substance of the patent application should be done by the national patent office or by the international patent institute because the controller of the particular country may not have sufficient material to examine the specifications.

Dr. S. Rohatgi: I would rather confine the examination to our own country. If we did not have an adequate number of exports to advise us or an adequate number of scientific men, we would certainly look to some other country for advice, but since we do have a number of experts now, I see no reason why we should not take advantage of their knowledge.

श्री चौरड़िया : आपने बतलाया कि प्रोसेस को पेटेन्ट किया जाय तो ज्यादा अच्छा होगा । परन्तु यह भी हो सकता है कि अगर कोई प्रोसेस पेटेन्ट किया गया तो कोई भी दूसरा वैज्ञानिक उस में थोड़ा सा परिवर्तन कर के अपनी तरफ से वही प्रोडक्ट बना कर पेटेन्ट करवा ले । आपका जो मेमोरेन्डम है एक ओर तो उस में यह बतलाया गया है कि उचित मुआवजा दिया जाना चाहिये जिस से कोई भी आदमी अपनी मेहनत का लाभ उठा सके, दूसरी ओर आप इस पक्ष के हैं कि प्रोसेस को पेटेन्ट किया जाये, जिस से दूसरा भी उस का लाभ उठा सके । इन दोनों स्थितियों में कैसे तालमेल बैठ सकता है ।

डा० रोहतगी : इस में मैं सिर्फ इतना कहना चाहता हूं कि लाभ की जो बात आपने उठाई है वह तो सिर्फ एक रीजनेबल प्राफिट की बात है कि कोई कितना लाभ लेना चाहता है । इस बिल में जो प्राविजन्स हैं उन के सम्बन्ध में मेरा कहना सिर्फ यह है कि पेटेन्टी वाजिब लाभ उठाना चाहता है तो इस बिल के जितने भी प्राविजन्ज हैं वह उस पर लागू नहीं होते हैं। लेकिन अगर कोई गैर-वाजिब तौर पर उस से फायदा उठाना चाहता है तो उस के लिये इस में काफी इलाज है ।

श्री चौरड़िया: आप इस बात से सहमत होंगे कि किसी भी खोज के बारे में कोई ऐसी लक्षमण रेखा नहीं रक्खी जा सकती कि इस में केवल इतना खर्च होगा या इस से अधिक खर्च होगा । ऐसी स्थिति में यह निर्धारित करना कहां तक उचित होगा कि इतने वर्ष की अवधि इस के लिये पर्याप्त होगी या पर्याप्त नहीं होगी । साथ ही यह भी हो सकता है कि यदि लाभ का समय दस वर्ष रक्खा जाय तो कोई आदमी विटैमिन बी 12 जैसी चीज की खोज कर के काफी कमा सकता है जब कि कोई ऐसी भी चीज हो सकती है जिस से उस को पूरा मुआवजा भी न मिल सके। ऐसी स्थिति में आप कितनी अवधि उचित समझते हैं कि जो कि इस में रक्खी जा सके ।

डा० रोहतगी: इस से पहले भी आप ने एक सवाल किया था जिस का पूरा उत्तर मैं नहीं दे सका था । वह यह था कि अगर कोई किसी प्रोसेस में थोड़ा सा परिवर्तन कर के दूसरा प्रोसेस पेटेन्ट करा ले तो वह उस से काफी फायदा उठा सकता है । मैं कहना चाहता हूं कि इस में सिर्फ प्रोसेस को पेटेन्ट करा लेने की बात नहीं है । अगर एक आदमी काफी रुपया खर्च कर के कोई रिसर्च करता है तो दूसरे को भी काफी पैसा खर्च कर के और रिसर्च कर के उस को बनाना पड़ेगा । अगर वह प्रोसेस में कोई तब्दीली करना चाहे तो भी उस को इस पर काफी पैसा खर्च करना पड़ेगा । इस लिये वह नो होऊ और पेटेन्ट दोनों ही लिहाज से बहुत कम दामों पर किसी चीज को नहीं बेच सकेगा, अगर असली पेटेन्ट वाजिब प्राफिट कमा रहा है ।

श्री चौरड़िया : हमारे यहां पुराने कानून में काफी अवधि दी गई है पेटेन्ट की । उस के बावजूद इतना समय बीत जाने पर भी और सहायता मिलने पर भी कोई नई पेटेन्टेड प्रोडक्ट नहीं बन पाई । अपवादस्वरूप कोई खोज हो गई हो तो बात दूसरी है । हो सकता है कि इस के लिये हमारे यहां सुविधाओं की अथवा लेबोरेटरीज की कमी हो । ऐसी स्थिति में क्या आप उचित समझते हैं कि किसी भी व्यक्ति को आप नकल कर के कंज्यूमर्स को एक्स्प्लायट करने का मौका देने के लिये पेटेन्ट पीरियड निर्धारित करें बजाय इस के कि दूसरों की नकल न कर के उस को वह इम्प्रूव करे । कुछ वर्षों के बाद हमारे देश में ऐसी स्थिति आ सकती है कि लेबोरेटरीज आदि की सुविधा हो जाय और नई नई खोजें हो सकें । ऐसी स्थिति में क्या यह उचित नहीं होगा कि यह सोचकर कि अभी तो हमारे यहां के लोग केवल दूसरों की कापी करते हैं अवधि कम रक्खी जाये ताकि पेटेन्ट जल्दी खत्म हो जाये और हमारे यहां के लोग दूसरों की कापी करने के बजाय स्वयं खोज करने की ओर अग्रसर हो सकें ।

The question of the period of life of a patent has been discussed quite a lot. A period of ten years is quite substantial. We feel that even seven years would be quite substantial.

Mr. Chairman: Earlier your Council has made a recommendation of seven years. The Government of India called a meeting....

Dr. S. Rohatgi: There seems to be a bit of confusion here. I do not think that this question was ever raised by the Pharmacy Council. It migh/

have been by the Indian Pharmaceutical Association or some other body.

In fact, the point which has been raised by the hon. Member is that we could presently imitate the process or at least put them in practice in our country but then a stage might come when it might be interesting for us to extend the life of the patent. I see no reason why we would not be able to modify our laws because laws of our country, as I understand, are made for the benefit of this country. There seems to be no difficulty in this regard, but in the present context, it is obvious that the Bill as it stands today will be of advantage to the country and to the people of this country.

Shri R. Ramanathan Chettiar: The Pharmacy Council consists of representatives of States and State Governments. That is what you said earlier.

Dr. S. Rohatgi: It consists of representatives of State Councils and State Governments and representatives nominated by the Central Government and Inter-University Board.

Shri R. Ramanathan Chettiar: Does it give any power to have a watch over the prices of life-saving drugs in this country?

Dr. S. Rohatgi: No; these powers are not given to us under the Act.

Shri R. Ramanathan Chettiar: What are your specific powers? Will you kindly elaborate them?

Dr. S. Rohatgi: The Pharmacy Council of India has specific duties. They are: regulation of the profession of Pharmacy, laying down the standards of education and seeing that they are maintained and if I may make it clear, when I say that the Pharmacy Council draws representatives from the State Councils, the Pharmacy Council, therefore, represents about 80,000 registered pharmacists in the country.

Shri R. Ramanathan Chettiar: You exercise only control over the pharmacists.

Shri B. K. Das: You have said in your memorandum that both public and private sector undertakings should pay royalty when they use the patent rights. But here, in another chapter under Cl. 48 there is some Government use in hospitals and such other places. What is your idea about that when Government use patent rights for hospitals and dispensaries. Do you like that compensation should be paid or it can be done without compensation?

Dr. S. Rohatgi: Since the Government is using the material and distributing it free of charge, we are not recommending that any royalties be paid. What we meant was that when the public sector undertaking takes up the manufacture and as the public sector undertaking is also working on profit motive, then there should be no objection to paying royalty.

Shri B. K. Das: You say when it is manufactured for commercial use.

Dr. S. Rohatgi: Then they should pay royalty or give an undertaking that they will supply the material to the Government on no-profit-no-loss basis.

Shri B. K. Das: Your idea is that when it is for any commercial purpose the compensation should be there and for other purposes of Government use, it can be done away with.

Shrimati Sharda Mukerjee: You had much experience of the market conditions and the manufacturing conditions of the pharmaceutical products. May I ask you one question? Many of the foreign people who came here and gave evidence before us said that this new Bill that is before us for consideration, would be a deterrent to foreign manufacturers from coming into India. We know that to a certain extent the present day condition of our economy and technology

has made it possible for these people to exploit us. If we were to adopt the Bill as it is, would you say that the country would suffer considerably as no new people would come and start manufacture of products in the country and whether we would be able to carry on even if they do not come or we have to pay prohibitive prices for the imported products?

Dr. S. Rohatgi: The situation is this: we do not foresee any reason why the foreign firms would not want to settle here for establishing their industries for the simple reason that if it pays them, they will come and if it does not pay, they would not come and take their patents here. India offers a very big market for their products and they will certainly come and like to establish here. In case they do not want to come—I will go to the other extreme—I feel that if for nothing else, it would give an impetus to Indian research and Indian industry to start production of those products here.

Shrimati Sharda Mukerjee: That of course one would hope would happen. But a drug should have a certain amount of guarantee that it is not a drug which will go wrong and it will not harm people. Second thing is: we do not want to introduce a legislation—you know these people are big cartels and they can starve the country—have you made any research during the last so many years into the condition of our pharmaceutical industry and whether this sort of legislation will throttle the industry here?

People have presented both points of view to us. Some people—even from India—said that if this Bill is passed, nobody would come and there are some people who said that by passing the present Bill we would be encouraging Indian industry. So, what I want to know is: have you carried out any kind of inquiry into this? This is really an important point in this kind of legislation. You can pass any legislation. Whether that legislation is premature or whether it is right—that is a thing which you have to decide.

Dr. S. Rohatgi: We have not really provided for abrogation of patents for drugs. What we have done is to protect our interests and I see absolutely no reason why, while protecting our interests, we are giving facilities to the foreign firms to take advantage of their patents, they should fight shy of exploiting this market. Nevertheless the point that you have raised is: whether the passing of this Bill might lead to a situation when foreign firms would not like to establish in India and the country would find itself in a very difficult position with regard to the supply of drugs. We have quite a large number of foreign firms established in India, and, if I might make bold to say, that the larger or the major part of the activities of these firms is not the basic manufacture of drugs but it is the processing of drugs. Now that being the case, processing is a thing which surely the indigenous industry can take up to any extent. We are fully equipped for the processing of any item. When we are faced with difficult position of not being able to get the active substance from any source, I personally feel that all the Indian talent put together would certainly find out a way out of the difficulty:

श्री विभूति मिश्र : कुछ लोगों ने गवाहियों में कहां है कि यह बिल बिल्कुल पास न हो। आप ने इस बिल का समर्थन किया है। क्या आप ने पता लगाया है कि वे क्यों विरोध करते हैं ?

डा० रोहतगी : आप के सामने इंडस्ट्री वाले आये हैं और आयेंगे भी और इस में कुछ उन को फायादा है इस वास्ते जाहिर है कि उदकी कोशिश यह होगी कि यह पास न हो। हम जो यहां पर आप के सामने हाजिर हूए हैं, हम किसी और हैसियत से नहीं बल्कि एक स्टेचुटरी बाडी के नुमायन्दे होने की हैसियत

से हाजिर हुए हैं। हम यह समझ कर आए हैं कि जनता का और देश का फायदा होना चाहिये न कि किसी खास इंडस्ट्री का ; उस तराजू पर सब चीज को तोल कर हम ने अपने विचार आपके सामने रखे हैं ।

श्री विभूति मिश्र: हिन्दुस्तान में जितने पेटेन्ट हैं, उन में से नव्वे फीसदी विदेशी लोगों के हैं। मैं यह जानना चाहता हूं कि हिन्दुस्तानी लोगों की योग्यता और क्षमता को देखते हुए कितने दिनों में हिन्दुस्तान के लोग इस व्यवसाय में स्वावलम्बी हो जायेंगे ।

डा० रोहतगी : हाल में जो चीन का हमला हुआ और उस के बाद जो पाकिस्तान का हमला हुआ, उस वक्त हिन्दुस्तान के काफी वैज्ञानिक इकट्ठे हुए थे। उन का उद्देश्य इस बात पर विचार करना था कि विभिन्न क्षेत्रों में हमारी जो आवश्यकतायें हैं, जिन के लिए हम अब तक आयात पर निर्भर करते थे, उन को पूरा करने के लिए हम क्या उपाय करें ।

श्री विभूति मिश्र : हिन्दुस्तान में पर कैपिटा इनकम पच्चीस, तीस, पचास, साठ या सौ रुपये से ज्यादा नहीं है। टाटा और बिड़ला के स्तर के लोग बहुत कम हैं। हिन्दुस्तान की जनता की यह स्थिति देखते हुए क्या आप में यह क्षमता है कि विदेशी पेटेन्ट की दवाओं की कीमत को गिराने के लिए आप अपनी दवाओं के पेटेन्ट निकाल सकें; यदि हां, तो आप कब तक यह काम कर सकते हैं ?

Dr. S. Rohatgi: The position with regard to price and what is often called as fair price or the price in keeping with the earning capacity of the people, is a very difficult question to decide. We have a large number of people in our country who can't afford even a fraction of a rupee for drugs. We can't manufacture drugs at a price which would make it available to all. That is not possible. But what we can certainly do is to make it at the most economic price. Now if the system itself is such that the manufacture of the drugs brings the prices high, the industry would be helpless. So this is a difficult question, though one would certainly like that the prices of drugs should come within the purchasing capacity of the consumers. It is a very difficult thing.

श्री विभूति मिश्र : जो विदेशी लोग हमारे यहां के नव्वे फीसदी पेटेन्टों का अधिकार रखते हैं, उन्हों ने अपनी दवायें बनाने के सम्बन्ध में भारतीय लोगों को किस हद तक ज्ञान और विज्ञान दिया है और हिन्दुस्तानियों ने इस में कहां तक प्रगति की है ?

Dr. S. Rohatgi: It is a very relevant question. The question is to what extent the 90 per cent of the patents which are held by foreign firms, have helped in the expansion of scientific research and development or industrial development in our country.....

Mr. Chairman: That is a different matter altogether.

Dr. S. Rohatgi: It has not been of very much help.

Shri Bibhuti Mishra: To what extent the foreigners who have got patents have trained our young scientists here and have helped us in our scientific development? This is a very relevant question.

Mr. Chairman: Let us decide that among ourselves.

Shri Bibhuti Mishra: Let us ask that gentleman. He knows everything.

Dr. S. Rohatgi: My reply to that question would be that out of the 90 per cent of the patents that have been taken by the foreigners, only a fraction of them are being utilised here.

Shri Kashi Ram Gupta: He wants to know to what extent they have helped our scientists to work here in our industries.

Dr. S. Rohatgi: All I can say is that they might have given employment to a few scientists. That is about all. Also, in the foreign firms, which are licensed here, the largest volume of turnover is in processing the material rather than manufacturing the basic product. So, that is not helping us to any extent. That is not increasing our scientific knowledge in any way. That is something which we already know fully well.

Shri Kashi Ram Gupta: There is a strong opinion in this country that for the next 10 years, to speed up progress in the pharmaceutical field, we need foreign collaboration. What is your comment on this?

Dr. S. B. Rao: Collaboration may really be required in the manufacture of certain new drugs which are very intricate in nature; for example the antibiotic technology is a very highly specialised field. But for the manufacture of synthetic drugs, I may be permitted to say that there is sufficient Indian talent and we can attempt any kind of complicated synthesis in this country with great confidence. I may also submit that no collaboration with any country is going to make the position any better in regard to prices.

Shri Kashi Ram Gupta: Therefore, we should have collaboration only in selected fields?

Dr. S. B. Rao: Yes, Sir.

Shri Kashi Ram Gupta: Now you have said that a 10-year period is quite enough. But for some time for our own scientists we need some more time. Well, it is not only the scientist who matters, but along with him there must be some capital also. When we speak of our own scientists, we speak of our indigenous capital as well. So, can we put such a clause that scientists who are working out the patent with indigenous capital may be given some time more?

Dr. S. Rohatgi: Please permit me to explain this a little more. What happens is that it is not merely the capital that makes the difference. When a scientific discovery is made, when a process is developed in a laboratory, a pilot plant has to be set up and manufacture started, and that requires the help of technologists, chemical engineers and so on. I can cite a case like the submerged fermentation process for antibiotics manufacture which was a revolutionary process developed by the Americans. When this research was being carried out in the laboratory, the chemical engineers were working side by side and no sooner the final results were obtained and the patent secured, the chemical engineers set up the plant and put it in operation. We in India do not have the facilities of chemical engineering to such an extent. That is the first point. The second is that if we want to erect a special plant, then we need a number of items; some are large and some, small; we might require special type of alloys, special type of stainless steel, glass lined equipment, etc., none of which is manufactured in India. It may take a year and a half to get them. Then we might need some packing materials. A simple packing material like Teflon which is used for packing in certain chemical plant, we can't get here. We have to import it. This process takes 2|3 years and for a small thing, the development of that plant and utilisation of that process is held up. That was the reason why we had made the suggestion, not from the point of view of capital.

Shri Kashi Ram Gupta: Your suggestion is all right but my point is this. When you take to commercial use, you need some capital. Scientists are not expected to cover the whole of the capital. To put to commercial use, capital may be needed. The point is if a new adventure comes in with the collaboration of the scientists and the capitalists in this country that must be given a higher protection of the period. Is that your opinion?

Dr. S. Rohatgi: Capital, of course, is a secondary thing. The important thing is availability of the plant and equipment and items of manufacture that are required, which in certain cases have to be imported. Now that is why we have suggested that a consideration might be given for increasing the time-limit in certain cases like this.

Shri Kashi Ram Gupta: That means for the new entrants; those who are already in the field must be possessing the machinery all right.

Dr. S. Rohatgi: Yes, Sir. I think this Bill would refer to the new entrants only. But that is not entirely it. A firm or a scientist working in a firm or having a laboratory of his own is working in a particular field—in the drug field—if he some times develops an item which needs a specialised equipment, he is held up, even though he is working in the drug field, because a certain specialised material is required which is not available in the country and which has to be imported and the process of importing it itself takes $1\frac{1}{2}$ years.

Shri Kashi Ram Gupta: That can be the problem for the present industry and the collaborators as well. There too the problem can arise.

Dr. S. Rohatgi: There the situation is slightly better, because they have already worked the process in their country. The plant can be fabricated in a short time. The whole plant is imported and set up here.

Shri Kashi Ram Gupta: On the last page you say the public sector undertakings should pay royalty or it should work on 'no profit no loss basis'. Are you aware of the fact that public undertakings are limited companies and when Government floats a limited company, naturally it is the first task to get a dividend. Therefore, the second suggestion becomes invalid.

Dr. S. Rohatgi: Actually I do not know whether there is any special clause of that nature in the public sector undertaking's Articles of Association, but I feel it is open to any commercial concern to manufacture and sell any product, at 'no profit no loss' basis. There is no restriction on them that they must sell only on profit.

Shri Kashi Ram Gupta: The question is that the Government policy is that a public sector company must also be competitive with the private sector companies.

Mr. Chairman: It is a matter for us to decide.

Shri Kashi Ram Gupta: Sir, we cannot deviate from it in certain cases and, therefore, I have put this question to him. He has put a thing and I want to explain the practical difficulties of it.

Mr. Chairman: It is a matter of law.

Dr. S. Rohatgi: Then it is quite clear that the first suggestion that has been made can be applied.

Controller General Patents: In the matter of chemical intermediates, you have said that it covers simple chemical substances, acids, alkalies, alcohols etc. I am afraid, this is not the correct intention of the Bill, nor is it the connotation which the word intermediates or chemical intermediates means to any pharmaceutical or other investigator. So you still feel there is any difficulty in the use of the word intermediates as provided in the Bill? Supposing it is clarified....

Mr. Chairman: Make it clear.

Controller General Patents: Sir, it never means that. Further, to the extent to which they may be used, they are used as intermediate for the preparation. Obviously it is not our

intention to include, for instance, as apprehended, Sulphuric acid or other basic chemicals, used at some stage or other for the production of medicinal substance. It is quite obvious. I should like to know whether you still feel....

Dr. S. Rohatgi: I would like to state that I entirely agree with the Hon'ble member when he stated that the common connotation of chemical intermediates does not include sulphuric acid, but what we were worrying about was the legal interpretation as it stands here. And we felt that any item that might be used in the synthesis of a compound could be brought within the purview of this particular clause. So we thought that it might be desirable to obviate any difficulties that might come in the future by making the definition slightly clearer.

Controller General Patents: You have suggested that in view of the gradually increasing degree of specialisation, it is next to impossible for any Government or any kind of office having any kind of staff on its rolls to give the necessary attention and have any knowledgable attention to be brought to bear upon any specification as to the novelty or otherwise of it. You have suggested consultation with some experts, of whom we have quite a number in the country. But are you aware that the statute provides that as and when such applications are received or presented, in the Patent Office, they have to be kept secret. That is the first statutory requirement and they have to be kept secret till they are accepted or acceptance is made known through advertisement in the Gazette. Now, therefore, there is a certain amount of difficulty in the Controller referring these secret materials which are to be kept confidential to an expert in any University or any national laboratory. That is one aspect. Secondly, it often happens in this field of industry, most of the inventors in the private sector might be following up closely on the same lines as those in the other sectors. I mean it is a competitive affairs, he who reaches the target earlier wins the race. Like that in a competitive situation, we may be having an expert in one of the national laboratories or Government undertakings, but an individual by his own effort may have made an invention. That invention has to be directly referred to a private expert, who, in order to be deemed to be an expert, must have been doing some research in the concerned field. That is a little difficulty in that. This has to be, of course, examined. Are there any countries in the world where at this stage at which we are now considering patent applications the specifications are permitted to be referred to any other person outside the Government employ or Patent Office? The Statutes generally do not provide that. I wish to make it clear that there is an exception. Lately, on account of the very heavy backlogs in the matter of patent applications which are being filed and which no Patent Office has been able to deal with sufficiently quickly, they have had to resort to a measure of allied nature. In the Scandanavian countries,.... In the Scandanavian countries—particularly I remember in Sweden—they refer patent applications for the purpose of examination of the technical content only to any expert who may be available or who may be willing. There is no list of their names. It is left for the Commissioner of Patents to refer them to anybody or rather it is the other way. Strict confidence is, of course, required. Is that the kind of thing you would like to have?

Dr. S. Rohtagi: Even in our field of research in which either of us is engaged we find that it takes quite a few hours daily to go through the scientific literature that is published

in different parts of the world. I cannot imagine that an expert in the Patent Office could keep track of the volumes and volumes of scientific literature that is coming from different parts of the world. Now the point which you have raised is very valid that in case it conflicts with the secrecy which has to be given to the patent application, to that extent it is correct. On the other hand, if any other outside expert has to be consulted it could be possible to obtain a vow of secrecy from him or some such arrangement could be made. If, however, this is not possible there would be another way and that would be that after the publication of the patent and before the acceptance there is a time-lag, and during that time-lag he could be consulted.

Dr. A. Joga Rao: That is not correct. So then it becomes anybody's problem. Nobody can claim infailibility in the matter of theory.

(*The witnesses then withdrew*).

II. Federation of Indian Chamber of Commerce and Industry, New Delhi.

Spokesmen:

(1) Shri Ramanbhai B. Amin—President

(2) Shri L. S. Davar.

(3) Shri C. H. Desai.

(4) Shri N. Krishnamurthy.

(*The witnesses were called in and they took their seats*)

Mr. Chairman: The evidence that you give is public. It will be printed and distributed to our members and will also be laid on the Table of the Houses of Parliament. Even if you want any particular portion to be treated as confidential, it will be printed and distributed to our members and will also be laid on the Table of the Houses of Parliament. We have received your memorandam. If you want to stress any particular point or make a new point, you may kindly do so. Afterwards, our members will put questions.

Shri Ramanbhai B. Amin: At the outset, we thank you for giving us this opportunity of saying a few words before this committee.

The first point that we want to make is about the confirmation of patents. If we have some sort of confirmation of patents in the present Bill, it will help considerably.

The second point that I wanted to make was about the time for granting patents. In the present Bill there is no provision for this. After the complete specifications are filed, the examination might take an unlimited period and thereafter also by the time a patent, is sealed it may be many months, as there is no time-limit. We feel that there should be a time limit so that one is assured of his patent in a certain period. We suggest that from the filing of complete specifications to the sealing of the patent, the time should be thirty months.

The time limit for the Examiner should be one year. Within a year he should examine the patent and then we should have the final patent in a certain specified period.

Further there should be provision for an Appeal to the High Court, in the relevant provisions of the whole Bill. In certain Sections it is provided but in quite a number of others it is not provided. We think it should be appealable to the courts to get proper justice.

Mr. Chairman: The experience is that the courts take a long time. Some cases have been pending already for a very long time. Would you be satisfied with an Appeal Tribunal as it is in England?

Shri Ramanbhai B. Amin: Yes, Sir. If we have a Tribunal the period for the decision should also be specified.

Mr. Chairman: We cannot specify the period as it is not allowed constitutionally.

Shri Ramanbhai B. Amin: Some guidelines should be there.

Mr. Chairman: Yes that is possible.

Shri Ramanbhai B. Amin: How the Tribunal is going to operate? Will that Tribunal be moving about in the country?

Mr. Chairman: We may provide that it may periodically visit important industrial centres. It will be Special Court for patents. Will that be acceptable to you. We have got the single judge tribunal in England.

Shri Ramanbhai B. Amin: In that Tribunal there should not be any people from the Patent Office.

Mr. Chairman: They will not be there.

Shri Ramanbhai B. Amin: Then in Clause 48 we were suggesting that when the Government wants to import some of the patented products from outside they must first give the chance to the local industry.

Mr. Chairman: You want the Government to give a notice first to the patentee.

Shri Ramanbhai B. Amin: We must look to the circumstances which may be prevailing at that time because it may be that for some of the intermediates that go into the production of this particular item the cost may be higher within the country and there may be a lot of idle capacity in the country—I am talking from the angle of foreign exchange difficulty which we are likely to suffer. So some such sort of provision will be helpful if it is provided in clause 48.

Ministry Official: Even normally Government will not allow imports if something can be done within the country.

Shri P. K. Kumaran: Suppose a medicine is not available within the country or they charge high prices. Should the Government not import?

Shri Ramanbhai B. Amin: That is why I say Government should give a notice as regards the price and capacity.

In our present Bill we have provided that information about novelty outside the country should be provided. Novelty outside the country is extremely difficult for a patentee to prove. It is very cumbersome and takes a lot of time. If we limit ourselves to what is available within the country, whatever knowledge is available in the country, and on that basis the patents are granted it will facilitate us a lot and things will move fast.

The terms of the patents we have given should be from the date of sealing—I think that is what the Act provides—and there is differentiation between drug and other patents. I think there is hardly any justification to hvae that differentiation. If possible, it should be the same.

Mr. Chairman: Do you know except Amercia every other country has made this differentiation?

Shri Ramanbhai B. Amin: If it is necessary there should be some provision for extension if there is hardship. Further for patents which are already granted their terms should not be disturbed.

Mr. Chairman: You do not want to have a retrospective effect.

Shri Ramanbhai B. Amin: Yes, Sir.

In our 'Licence of Right' provision we have mixed up the drugs and food patents along with the chemicals and the optical glass and other patents. I accept that licence of right is necessary for drugs and food products, but why mix up the others with these? It would also be better if we can provide in the Bill a specific period within which Clause 88 can be made applicable, so that within a year's period or so the final judgment should come, so that it is not unnecessarily prolonged or lengthened.

In the case of compulsory licence, a period of three years is given for monopoly use to the patentee. Similarly, there is justification in the case of drug and food patents also to give the patentee a three year period after which only a licence of right should be given to others, rather than having it from the date of sealing.

Mr. Chairman: Then there is no difference between the two.

Shri Ramanbhai B. Amin: The procedure for compulsory licence is laid down in the Bill itself, and it might take even five years, while the licence of right is automatic.

Shri L. S. Davar: If a product claim is allowed, which is limited to the process, in the case of an infringement, the onus of proving that the product has not been manufactured by the patented process should shift from the plaintiff to the defendant as is the case in Germany and Holland.

Dr. C. B. Singh: What have you to say on Clause 48 where Government want to use a patent for their own use?

Shri Ramanbhai B. Amin: If a plant is to be put up by Government, which includes public sector undertakings, C.S.I.R. etc., why should they use the knowhow developed by a patentee without paying any royalty?

Dr. C. B. Singh: About royalty what have you to say?

Shri Ramanbhai B. Amin: You have put a limit of 4 per cent. It would be better if we have no limit, because 4 per cent is very little in this sense that out of that tax will go and hardly 2 per cent will be available to the person who takes out the patent. The normal custom is to go up to 10 per cent. If you are going to have a royalty, it has to be a little higher. Again, if you put a higher figure, everybody will try for the higher figure. So, it should be left to negotiations between the parties.

Dr. C. B. Singh: The complaint has been made that hardly any research has been made in this country. Do you agree to this general proposition that research has lagged behind in this country?

Shri Ramanbhai B. Amin: No, because if you study some of our pharmaceutical industries on the western side, you will find that there has been quite a lot of research done.

Dr. C. B. Singh: You restrict your remarks to pharmaceuticals. The Gujaratis persons from Ahmedabad themselves have said that hardly anything has been done. They have told us so here.

Shri Ramanbhai B. Amin: I can tell you from my first-hand experience, because I am heading a pharmaceutical company and we are continuously doing research. We are also expanding continuously our research facilities.

Dr. C. B. Singh: How much money you are spending in the firm?

Shri Ramanbhai B. Amin: I cannot tell you off-hand.

Dr. C. B. Singh: You may give us a rough figure.

Shri Ramanbhai B. Amin: I can send you the information. But I think the proportion is between two and two and a half per cent on our sales value. It may be about Rs. 14 lakhs to Rs. 15 lakhs per anhum.

Dr. C. B. Singh: You have not been able to produce any patented drugs.

Shri Ramanbhai B. Amin: We have taken out several patents, and we are developing our patents; we are holding about 13 to 14 patents in Alembic, Boaroda.

Dr. C. B. Singh: To increase the quantum of research you said you are spending two to three per cent.

Shri Ramanbhai B. Amin: We would like to go up to five per cent if the

profit margin permits us and if we get talented people to head the various research departments that we are developing.

Dr. C. B. Singh: The complaint has been made that the drug industry is making huge profits.

Shri Ramanbhai B. Amin: That is not quite correct, considering the whole spectrum of the industry.

Dr. C. B. Singh: I would be very happy if you can prove that it is wrong.

Shri Ramanbhai B. Amin: The drug industry in the last year has been squeezed quite a lot in the sense that the prices have been pegged in 1962 and since then the cost of almost every thing has gone up, right from labour, raw materials, packing materials, etc., and still the drug prices are the same. As a matter of fact, what is happening now is in some of the drug items, the manufacturers have to stop manufacturing because they cannot continue to lose. I think that the general feeling that there is huge profit being made is not right. It may be so in a very few items.

Dr. C. B. Singh: I agree with you that there are two or three firms like that. Is that the general condition in other pharmaceutical firms, excluding Alembic and CIBA?

Shri Ramanbhai B. Amin: Other firms have started developing their research departments and they are expanding. Sarabhai Chemicals is doing so. Many other firms have started research departments and are expanding them. It is a gradual process.

Dr. C. B. Singh: Our feeling is that this is proceeding very slowly. We know they have started such departments. We have seen most of them, but the progress is very slow. Can you suggest anything by which you can increase the tempo, because new drugs can be found only by greater amount of money being invested and spent, so that better research is done and more and more new drugs are found?

Shri Ramanbhai B. Amin: One of the things is to give protection when you find out a novelty.

Dr. C. B. Singh: That is quite right. Any other suggestion?

Shri Ramanbhai B. Amin: I think it is rather difficult to show any specific way to go about it excepting that we have to create a climate not only in the drug industry but in all industries because the present conditions do demand such a thing.

Dr. C. B. Singh: How will you want us to create a climate? You are in this profession and we would like you to tell us something about it.

Shri Ramanbhai B. Amin: There may be some special tax relief; as Shri Manubhai Shah said at one of the meetings of the Board of Trade, for those who are willing to develop research some grant-in-aid may be given.

Dr. C. B. Singh: There is already an income-tax rebate on research.

Shri Ramanbhai B. Amin: I know. If these measures are not enough, we have to go about it in newer ways. Grant-in-aid may help those who are doing research already, rather than those who are not doing research now. Some method can be worked out. I think we should create a general climate that only through research we will be able to reduce our cost of production, and on the part of the Federation, we are trying to discuss it continuously in our committees and come out with circulars advising our people in that direction.

Dr. C. B. Singh: You represent a very important body. Something coming from you has got a great meaning. You have mentioned tax rebate. You want to create a climate, which is a vague term. The climate today may be good and tomorrow it may become worse. I should like you to say something more.

Mr. Chairman: Could you discipline your members to spend a certain percentage of their profit on research?

Shri Ramanbhai B. Amin: The Federation is a voluntary body. There is no question of discipline like that. But we can, by discussion amongst ourselves, point out the benefits which will accrue out of the new research which will go to reduce the cost and improve the products and prevent the drain on the economy. That is being done.

Mr. Chairman: Have you taken any steps in that direction?

Shri Ramanbhai B. Amin: We would very much like to have the suggestions from you. We are trying to do on our own; and we are not only quite alive to the problem but are also trying to do it in our own way.

Shri Bade: I am shocked to hear the witness saying that the action should not be retrospective. That is against the spirit of the Bill itself. Does the witness want that the foreign pharmaceutical firms should continue to exploit India as they have been doing all through these years?

Shri Ramanbhai B. Amin: I am quite clear in my mind because I am heading a pharmaceutical company myself. I know all the difficulties that we are having because of foreign patents, but at the same time I would like to respect the capital or the cumulative knowledge which they have acquired by spending money, and that is why I am pressing for it.

Again, as I told you, we would like to have licence of right, so that we can definitely exploit them. We would not like them to continue to exploit us in the sense of not allowing us the entire field. But if they develop the knowledge, we should respect it and pay for it. The licence of right provision will definitely make us use the new inventions that they have developed by paying reasonable amounts of royalty. It is not that we will be debarred from using them.

Shri Bade: When you say that the Bill should not be retrospective that means that we should keep the period of patents as it is running for the last few years.

Shri Ramanbhai B. Amin: Retrospective effect is something not desirable. If having granted something, we would have the right to withdraw, from the equitable point of view, is it a desirable thing?

Shri Bade: Is it equitable that they should go on exploiting us more at the cost of the poor people?

Shri Ramanbhai B. Amin: That is not the intention. The licence of right provision will take care of that. They cannot continue to exploit us.

Shri Bade: In what way do you want it to be retrospective?

Shri Ramanbhai B. Amin: It is only about the time-limit, not about other things. Once having granted 16 years, we do not want it to be brought down to 14 years.

Shri Bade: Regarding clause 48, you say that we should first give a chance to the producers in the country first and only if they refuse, Government should import it?

Shri Ramanbhai B. Amin: If there is manufacturing capacity within the country, that should be fully exploited before we fritter away our foreign exchange in importing them.

Shri Bade: Clause 48(d) refers to "a machine or innovation".

Shri Ramanbhai B. Amin: If that machine is manufactured within the country, Government should try to procure it locally before they import it.

Shri Bade: Instead of the Government taking the whole thing and abrogating the patent, if the

Shri Ramanbhai B. Amin: If this Bill is passed with the amendments that we have suggested, I do not think foreign capital is going to be scared away.

Mr. Chairman: Thank you very much, Shri Amin, for coming here along with your colleagues and helping this Committee in considering this Bill.

(The witnesses then withdrew)

III. Shri V. B. Chipalkatti, Director, Shri Ram Institute for Industrial Research, Delhi.

(The witness was called in and he took his seat)

Mr. Chairman: The evidence that you give, Mr. Chipalkatti, is liable to be printed and published. It will be distributed to all our members and laid on the Table of the House. Even if you want any portion of it to be treated as confidential, it will be printed and distributed to our members and Members of Parliament.

We have received your memorandum. It has been circulated to all members. If you want to elaborate any point or make out any new points you may kindly do so. Afterwards members of the Committee will put their questions.

Shri V. B. Chipalkatti: In my memorandum, Sir, I have touched on the question of product versus process patent, the question of time limit, compulsory licensing, licence of right and I have made some general comments also. On the specific questions regarding product versus process patent and other items I will reply in the end if any questions are put to me. But there are some general comments which I consider very imporant.

On page 4 of my memorandum I have stated:

> "The total experience available in India on all aspects of patents could be considered inadequate so that the approach to the Patent System at the moment appears more politically biased than technically biased. It is suggested that Sub-Committees of representatives of Patent Attorneys, Patent Examiners and Experts and Specialists with adequate experience in patenting and in the utilisation of patents, are formed with a view to make a report on the existing status of technical knowledge as applied to the present system If this is not done, there is a great danger that the present confusion in Patents would get further confounded."

What I mean to say here is that it is not the existence of a law that ensures correct national interest being safeguarded. If technically the country as well as those who take patents and those who utilize patents do not have necessary experience and skill, many times foreign patentees who have this experience and skill can manage to take patents and work them in such a manner that it is virtually impossible for local people to take advantage of the law.

I might refer here to the existence of a compulsory licensing clause in the present Bill. I believe that even this system of compulsory licence is not properly utilized. So I say:

> "Far greater stress to make the compulsory licensing system more effective is called for. Unless greater experience is gained in this field, no far-reaching changes in the present Patent Law seem to be called for.

Since 95 per cent of the patentees are foreigners, and since a majority of these patents are not utilised in India, it is obvious that the Indian Patent System merely acts more or less as a clearing House of a new patent literature. It would be far more useful to make an expert review of the utilisation aspects of the patents and

concentrate on remedial measures."

rather than concentrate on the legal aspects, at this stage of development.

The system of patent examination in India should be made more competent for this purpose. There should be efficient and competent staff in the Office of the Controller of Patents to ensure that third-rate patents, having no genuine inventive merit, are not granted.

Shri Bade: You have stated that this is more a political than a technical measure. According to jurisprudence, all contingencies cannot be covered by a law. The law tries to plug all loopholes. From 1911 onwards the foreigners had the advantage of squeezing and mulcting the poor people of India in the matter of drugs by creating a monopoly. Do you not think that the foreign industrialists and pharmaceutical firms will be annoyed and disturbed that such a Bill is being passed?

Shri V. B. Chipalkatti: I think it is quite in order that they should be annoyed. But I do not know how we help ourselves by merely annoying them.

Shri Bade: Suppose we make all patents regarding drugs and food automatic licences, will it not be beneficial to us?

Shri V. B. Chipalkatti: May I cite an example here, trying to make clear the point I made? For the last ten years we have taken about 120 to 130 patents in our research organisation and about two years ago I was myself conducting some research work on making wash-and-wear fabrics. I thought it was a genuinely new invention for which I should try to get patent protection. But by the time I had made an application and have prepared a specification for an application, I found that a firm in U.K. had already put up an application in the Patent Office, covering the subject matter of what I was trying to do. Then I thought, let me make use of the compulsory licensing system so that if our industries are interested, they could use my work, which would not need any foreign collaboration or foreign technical know-how. But, to my great surprise, I found that our industry itself, even if the patent was thrown open to the whole country, was not in a position to utilize the patented know-how for the benefit of the nation. Therefore, such things are involved, when we talk of whether a law is right or a law is wrong. I wish to make it plain that I do not consider myself to be an expert in deciding what should be the legislative aspect of the patent law. I do not think people like me should interfere in these matters but when we are given a chance to say something, all I wish to point out with great stress is the need for having expertise and knowledge about what is involved in a certain patent and utilisation of a patent is not as easy as it looks on paper. That is the point I would like to make.

Shri Bade: You have suggested in your memorandum that patents for drugs and medicines should be abrogated.

Shri V. B. Chipalkatti: No, Sir. I have stated here that if the law decides that product patents in medicine may not be granted, there will be some harm caused to the flow of knowledge into the country. If the foreign firms know that their patents will not be granted, they will not make an application. If they do not make an application, that knowledge remains out of bounds for Indian workers. To that extent, I would urge that all patent literature should be taken as a disclosure for the benefit of the nation and after a patent is given, if the compulsory licensing system is properly invoked, I see no reason why India cannot prevent some of the harm that is being done.

Shri Bade: On page 2 of your memorandum it is stated:

> " . . . instead of excluding all pharmaceutical and food products from patentability, the Government may insist on compulsory licences in all nationally important cases."

It implies that you are not in favour of compulsory licences for all drugs and medicines but only in those cases where Government thinks proper.

Shri V. B. Chipalkatti: Yes, I hold that view because I feel that in another ten years' time the Indian researcher will come into the field when this law will work against his interest, and I certainly do not want that there should be any patent law which will not give any incentive to the individual researcher who is working for the benefit of the nation. The same thing will hold true of Indian firms who are employing researchers in their organisations. So, if it is made a general law irrespective of national interest, then all the incentive to the research workers will be taken away.

Shri Bade: In the USSR the original inventor is given a certificate called the authority certificate. The Government takes his invention and sells it to other companies. Are you in favour of such a system?

Shri V. B. Chipalkatti: I am afraid I do not have a definite view on that. If the Government is more efficient than the individual, I think this system is alright. But if the individual happens to be more efficient than the Government, this system will be detrimental.

Shri Bade: The Government is made of individuals. It is not separate from individuals. Anyhow, on page 3 of your memorandum you have stated:

> "In spite of the fact that this system of compulsory licensing has been in existence for quite a long time, it seems that the advantages of the clause have not been properly utilised for the good of the nation."

Who have not utilized it?

Shri V. B. Chipalkatti: The Indian entrepreneurs, scientists and technologists, who are involved in making this compulsory licence system a success, do not even approach the Government asking for a compulsory licence because the total condition of our industry and the total level of technical knowledge and skill that ought to be there to appreciate the contents of a patent is absent here.

Shri Bade: According to you, this Bill should be more stringent and we should have more restrictions on the foreigners. They must start the industry here and not import medicines etc., from outside.

Shri V. B. Chipalkatti: Yes I think, it would be very very nice if the Government of India or the patent law could do something to see that the foreigner starts manufacturing the product in India. But this may be a question of economics—of consumption and of investment.

Mr. Chairman: Of foreign policy also.

Shri B. K. Das: Just now you were pointing out that we should take care that our Patent law does not go against our own industry and scientists. Which particular provision did you have in your mind?

Shri V. B. Chipalkatti: Suppose, we have a patent law in which every patent that is issued has a licence of right stamp on it from the very beginning. Naturally, what will happen is that the confidence of the young and, perhaps in many cases, inexperienced inventor will be shaken by the past history. If the past history points out that even after you do a lot of good work you do not get any incentive or return from that, the

young man will not be interested in putting his best effort. So, I hold that the patent law is genuinely for the interest of the society as a whole because the knowledge that comes out in written form in the patent is a very vital piece of literature. Anything which helps the publication of such knowledge in a very free manner, whether the patent is utilised or not, in my opinion is very healthy.

Shri B. K. Das: I am quite puzzled by your comment on clause 45 (page 3). You say there that since 95 per cent or more of the patents belong to foreign patentees, this clause is considered healthy.

Shri V. B. Chipalkatti: I believe, I did not follow it very well when I wrote this. Since then I have been thinking about it and today I wish to take the opportunity of adding one or two sentences which are needed to be added to this. I am very sorry for this. I may explain what I wish to say here. At the moment a large number of patents are held by foreigners. Therefore, if we introduce this clause of licence of right, it would mean that the Indian researcher is not affected. In fact, supposing, the same thing was going to be done after ten years when I expect more and more genuine Indian patents would come into the field, the Indian researcher is going to be affected from the point of view of incentives. So, though the clause appears to be healthy at the present moment, in the long run it may not be. This is what I wanted to say here.

Shri B. K. Das: You have gone through the Bill as it is before us. You have seen that we have placed food and medicines on a separate basis so that there may be improvement and research in them and cheap medicines may be available to the people. Do you not think that it ought to be done?

Shri V. B. Chipalkatti: Quite frankly, passing of a law will not do this. Using the existing patent law more efficiently in my opinion will be far more important than making any changes in the law. So, with the compulsory licence system, if the existing Act is made more efficient and effective, it will be quite all right.

Mr. Chairman: Except for the USA, all other countries have made this distinction in respect of articles of food, drugs and medicines.

Shri V. B. Chipalkatti: There may be some differences in the manner in which they have done it.

Mr. Chairman: They have prescribed a lesser period. Some countries have even adopted that there should be no patents of drugs and medicines.

Shri V. B. Chipalkatti: I am sorry, I do not know that.

Shri Kashi Ram Gupta: It is made out that basic research requires a huge amount of money to be spent.

Shri V. B. Chipalkatti: It depends on what basic research we are thinking of. The money is required not for making an invention but for testing it. Unless a new drug is tested very scientifically and very properly its utilisation is almost impossible. Some of these foreign firms which do the testing not only in their own countries but also in other countries are, in my opinion, doing a very useful service—to India also—when they spend a lot of money in testing their new drug. I do not think at the present stage we are well organised for doing this large-scale testing which is very costly.

Shri Kashi Ram Gupta: So, research is not expensive but testing is expensive.

Shri V. B. Chipalkatti: Yes.

Shri Kashi Ram Gupta: Can you make out the difference in the allocation between the two?

Shri V. B. Chipalkatti: I am not an expert on pharmaceuticals but in

my own field of textile chemistry and chemicals, we have made some calculations of the money spent right from the day you start research to the day the research becomes commercially utilisable and my estimate is that for every rupee that we spent on research, Rs. 10 to Rs. 30 are required for making that research commercially feasible. The research organisation's job normally stops after spending the first rupee and probably adding eight annas or another rupee to transfer conviction and confidence to the people who are going to utilise it. The researcher himself is incompetent and incapable of utilising his own work. There are instances in history where a particular research has been used after the man is dead and gone after 100 years. So, the utilisation aspect of any research work is a far more complicated thing than the invention aspect.

Shri Kashi Ram Gupta: That Rs. 10 to Rs. 30 include cost of machinery and everything.

Shri V. B. Chipalkatti: No; this does not include any cost of the plant or land or the investment required for running a factory. This includes only the intermediate stages. For example, you have to test the efficacy of the process or the cost estimates as they come from the laboratory process. Then, when you scale up a process, you find that some of the very basic, fundamental mathematical formulae on which these processes are based need to be changed to suit the new environment. Then, you must test whether the production is commercially acceptable to the consumer. You must also test whether the instrumentation and the flow of goods is reliable qualitatively and quantitatively. All this involves about three or four steps which we generally describe as laboratory development, pilot plant development and semi-commercial development etc.

Shri Kashi Ram Gupta: That too requires apparatus and all those things.

Shri V. B. Chipalkatti: That requires industrial apparatus and not research apparatus.

Shri Kashi Ram Gupta: In your Memorandum, you have made some comments on the working of the patent office. All this leads one to conclude that you require something which may help the patent office in its working. Is that the idea of having expert committees?

Shri V. B. Chipalkatti: As a researcher for the last 10 or 15 years, I have felt some need. For example, we take some patents in the United States. We have about half a dozen patents taken in the United States. The rigour with which the United States Patent Examiner will ask questions to us, the efficiency with which he will point out to us the basis of prior knowledge is much better and it is about hundred times more difficult to take a patent in the United States than it is in India. Out of 90 per cent cases we have found out that the Indian patent office is on a free-come and free-go basis.

Shri Kashi Ram Gupta: You want an expert committee....

Shri V. B. Chipalkatti: They are not liberal. I do not claim it. They do not have the necessary experience behind them.

Shri Kashi Ram Gupta: My point is that your suggestion for an expert committee is to aid the present Patent Office in its proper functioning.

Shri V. B. Chipalkatti: Yes.

Shri Kashi Ram Gupta: You have mentioned that you have got in the last so many years 130 patents. May I know whether they are mainly for textiles and such other things or also for pharmaceuticals?

Shri V. B. Chipalkatti: We have no patents for pharmaceuticals. We do have patents for chemicals.

Shri Kashi Ram Gupta: You have said that there is difficulty in this country for the industry to utilise in the proper way the knowledge of taking patents and all these things. Is your reference to some particular industry or is it general?

Shri V. B. Chipalkatti: I think it could be easily generalised. By and large, ours is a young nation. The history of industrialisation is hardly about 15 to 20 years old and I believe that the awareness that is required for improvement either in quality or in cost is generally absent partly due to our protected economy and partly due to a lack of expertise in the country.

Shri Kashi Ram Gupta: Even in industries like textile and sugar?

Shri V. B. Chipalkatti: Yes, Sir. In textiles, we should be the leader in the world. But I do not think we are. We are only third or fourth in the list of textile manufacturers in the world.

Shri Kashi Ram Gupta: Are we wanting in money or are we wanting in something else?

Shri V. B. Chipalkatti: It is a question of totality—we are wanting in good Government, we are wanting in good integrity amongst individuals and we are wanting in so many other things.

Shri Kashi Ram Gupta: What is the main factor behind it?

Shri V. B. Chipalkatti: I am afraid, I cannot give you one answer to this. But my total answer is a lack of proper expertise in the country.

Dr. C. B. Singh: You have to your credit more than 100 patented processes and products in the country and outside.

Shri V. B. Chipalkatti: Most of our products are only in India.

Dr. C. B. Singh: Anything outside also?

Shri V. B. Chipalkatti: No. We tried in the past and there were enquiries from Israel, Australia etc. etc. but these did not materialise due to one reason or other.

Dr. C. B. Singh: Anyway, you tried in India and you have got more than 100 patented products and processes.

Shri V. B. Chipalkatti: Yes. About 60 per cent of them may be utilised.

Dr. C. B. Singh: That is a very good news. May I know what is the expenditure spent on research in your research laboratories? If it is confidential, I don't want you to tell us that.

Shri V. B. Chipalkatti: There is nothing confidential.

Dr. C. B. Singh: We are very much concerned with it.

Shri V. B. Chipalkatti: Our annual budget is of the order of Rs. 20 lakhs. This is all earned through contract research. We have no money of our own. Our Trust has limited income.

Dr. C. B. Singh: You mean certain industries offer you problems.

Shri V. B. Chipalkatti: Those who utilise our facilities offer problems and we solve them.

Dr. C. B. Singh: From your evidence, it seems that you are in favour of a strong patent protection. Is that correct?

Shri V. B. Chipalkatti: Yes.

Dr. C. B. Singh: The reason advanced by you for a strong protection is that it will help the inventor.

Shri V. B. Chipalkatti: Yes.

Dr. C. B. Singh: Our complaint has been that the patent law has gone against the country as far as the drug prices are concerned. Will you suggest something whereby, in spite of their being a strong protection, you can do something about the price control of these patented drugs?

Shri V. B. Chipalkatti: Again, I am speaking as a non-expert on drugs. The price of drugs or the price of any patented product for that matter depends on many factors apart from the patent system or the patent law. In any case, in our day-to-day work, we are hardly conscious of the existence of a patent law when the price is fixed. That by having a patent law which is supposed to be better than the existing one we will do something to the prices somehow does not convince my mode of thinking.

Dr. C. B. Singh: You mean to say that is not going to reduce the prices?

Shri V. B. Chipalkatti: There are many other factors apart from this.

Dr. C. B. Singh: What do you suggest by which the prices will come down? We are anxious to bring down the prices.

Shri V. B. Cnipalkatti: I am afraid I am not at all an expert on pricing policy.

Dr. C. B. Singh: You mean to say that the pricing policy should be enough to bring down the prices?

Mr. Chairman: He is not an expert on that.

Shri V. B. Chipalkatti: I have not enough knowledge on that.

Dr. C. B. Singh: Here, in the case of a dispute, an appeal has been allowed and the appeal goes to the Government. Are you in favour of the Government being the final authority on that?

Shri V. B. Chipalkatti: Yes.

Shri D. P. Karmarkar: If I understood you aright, you want protection being given to the Indian scientist. Would you rather prefer, as a practical policy, that in the case of such products like pharmaceuticals, food, etc., the Government may themselves take the power of issuing the compulsory licence? Is that your idea?

Shri V. B. Chipalkatti: As a citizen of this country, having seen many things in our social structure, at the present moment I am chary of increasing the powers of the Government beyond the very minimum. I think if the Government does less work particularly in the industrial and production fields, the country will stand to benefit. From that point of view, taking from the inventor a certain patent and then Government giving some return for that, Government has not only to give an incentive to the inventor but also to justify that. It will be justified only if the invention comes into actual use. I believe, Government as an agency to do the second part, is not the proper agency.

Shri D. P. Karmarkar: Ten years later, when our Indian research workers will come into their own, their interest will be adversely affected. The national interest also will be affected by this reduced period of ten years in the case of pharmaceuticals and drugs.

Shri V. B. Chipalkatti: Reducing the period was not the point. The point was 'licences of right' stamped on that.

As far as the reduced period is concerned, I hold the view that the lag between the date on which the patent is applied and the date on which it can be reasonably used in India is a minimum of 6 to 7 years and if you have only ten years as the period for which the patent will be in force, then the inventor gets really only three effective years or in some cases only one or two effective years.

I consider the present 16-year period as more reasonable to the present Indian scene.

Shri D. P. Karmarkar: Just a moment ago, Dr. Singh was asking about high prices. This Committee has found that, whenever a patent is in effect and when there is manufacture, the prices of some imported medicines are inordinately put up very high. The only way in which that could be prevented from happening would be to establish some sort of a control. Would you suggest, in order to prevent such an abuse by the industry, having a sort of an advisory machinery, on which naturally Parliament would be represented, Government would be represented and technical bodies and industries would be represented? Would you think that such a machinery to advise on prices would be beneficial?

Shri V. B. Chipalkatti: I did not think about it before. But on the face of it, some kind of a machinery, by which the price system is fair, would be desirable. I really do not know if you will get the necessary information to see that the Committee works efficiently. Many times information may be suppressed or may not be given properly, but there seems to be some need for action if the feeling is that the patent system causes this type of price rise. In my opinion, if the product is new, the firm or the individual who has taken a large amount of risk gets the maximum benefits in the first few years. If you see the position in other countries, the price always goes down and down as time goes on. Personally I am not very much afraid of a very heavy price being charged for some time. If the economy is productive enough, I think prices would take care of themselves. Only in a low productive economy, all this trouble arises.

Shri A. T. Sarma: Is it a fact that some foreign pharmaceutical firms are run by Indian technicians?

Shri V. B. Chipalkatti: Yes; I believe so.

Shri A. T. Sarma: Is it a fact that at present India is in possession of pharmaceutical technicians?

Shri V. B. Chipalkatti: We have a fairly large number.

Shri A. T. Sarma: Would they be benefited if the Bill is passed?

Shri V. B. Chipalkatti: No. We do not have many researches in the field. The firm managers are there, the technicians who are running the factories are there, but many of these foreign pharmaceutical firms do not start research in India. They always say, "we depend for research on our principles in our own country".

Shri A. T. Sarma: My point is this. If they are given an opportunity, will they be benefited?

Shri V. B. Chipalkatti: It would not be automatic. In fact, if you permit me, I would like to say that between the passing of a patent law and the deriving of the benefits of that patent law, there are so many things involved that I would not venture to say that a mere passing of the patent law would get the result.

Shri A. T. Sarma: In your Memorandum you have supported the existing law.

Shri V. B. Chipalkatti: Yes—90 per cent of it—except that I would like compulsory licensing to be used more effectively.

Shri A. T. Sarma: I want your clear opinion whether the Bill will be beneficial to the interest of India or not.

Shri V. B. Chipalkatti: The answer is neither yes nor no. This will be one more Bill. In my opinion the present Act is quite adequate and let us concentrate on using the present

Act better rather than having a new Bill.

Shri R. P. Sinha: I have gone through the Memorandum of the learned witness and have also heard him. The three points which he has stressed are in regard to licence of rights, compulsory licence and the period. After listening to him I feel that the Indian interests as such, I mean, the Indian research workers, will not be benefited by the present Bill because of these three Clauses. Have I correctly understood you?

Shri V. B. Chipalkatti: To the extent the incentive part of it is lessened, it will not benefit.

Shri R. P. Sinha: After listening to the witness and also after going through his Memorandum, I find that the motivation behind the framers of this Bill appears to be mainly to curtail the abuses of the foreign patent holders who are taking too much of patents and are not utilising them, and to compel them to use those patents and not to use them in the monopolistic manner. This appears to be the main purpose of this Bill and they have not taken into account as to how to help the Indian research workers like yourself or an institute like yours. Will that be a correct conclusion to draw from that?

Shri V. B. Chipalkatti: You might draw that conclusion.

Shri K. V. Venkatachalam: You were saying that your programme of work is some sort of a contract programme, that is, you do not have a regular budget as any research institution will have. Can you elaborate it further?

Shri V. B. Chipalkatti: We are a private non-profit trust. We have a fixed income which comes in the form of dividends from the trust.

Shri K. V. Venkatachalam: How much is that?

Shri V. B. Chipalkatti: About Rs. 5 lakhs.

Shri K. V. Venkatachalam: That is your base?

Shri V. B. Chipalkatti: On that basis we try to exist and try to create work. We go to the Government of India. We go to private industries. We make schemes. We tell them, "If you do this, it will help you". Sometimes they on their own come to us and we try to create projects in which the advantage of the research work, the cost required, the time required and the results expected are all written down in black and white and if the party is interested, then they come to us and we charge them on a no-profit basis.

Shri K. V. Venkatachalam: On this basis, can you have a steady programme of work?

Shri V. B. Chipalkatti: It is very difficult. But we have been existing for the last 15 years.

Shri K. V. Venkatachalam: You just exist? So you just exist. From that point of view I would have thought that you are not strongly based.

Shri V. B. Chipalkatti: Yes, for expansion, for taking new activities, etc.

Shri K. V. Venkatachalam: You are on a hand-to-mouth basis from what you say?

Shri V. B. Chipalkatti: Yes.

Mr. Chairman: You are in favour of product patents. Am I correct?

Shri V. B. Chipalkatti: Again I want to stress on the technical aspect of this thinking. I can give you an example. Here is a wash-and-wear fabric. Tomorrow I make a new fabric. I apply for a process to do it

and also I apply for the product which is based on that process. I take both the patents. The present Bill provides facilities for taking both. But if you examine the claim of mine that I have got a new product properly made, in 99 cases out of 100, possibly that the new product claim will not be a proper invention. It can be a proper invention only if I could hoodwink the Patent Examiner because textiles have existed for thousands of years. For example, if in a pharmaceutical patent, something based on quinine was to be made as a new product, until the constituents of that new product and the effect given by that new product are sufficiently large to claim a new product, a new product patent should not be given. Therefore, even under the existing law it is possible to make it very difficult for the applicant to get a product patent very easily. If that happens some of the abuses of the present law will go away automatically. If, on the other hand, we do not give the Patent Controller finances sufficient for running his office, sufficient finances to employ experts in various fields, in which case even the new Bill would achieve hardly anything. What is, in my opinion, necessary, is to see that the Patent Controller's office becomes extremely efficient and is helped by a large number of experts.

Mr. Chairman: That is a different matter. But suppose if you give product patents, you shut out all inventions and discoveries to find out new processes. It will be a disincentive for inventions.

Shri V. B. Chipalkatti: I do not know if the product is specified properly and if the process for making the same product would be available, that process can be followed. It can well be followed and somebodyelse can make the same product and ask for compulsory licence.

Mr. Chairman: That comes in only when the patentee takes objection to an infringement but if an inventor finds out an altogether new process for manufacturing the same product by a new and cheaper method and produces the product, why should he not be given patent?

Shri V. B. Chipalkatti: He may be given a patent for the new process.

Mr. Chairman: But if the product patent is maintained, it will shut out all new inventions.

Shri V. B. Chipalkatti: Is it not unfair to a person who has brought a product into the market after testing on lakhs and lakhs of people? After all he has done something for the society.

Mr. Chairman: Science is always a progressive science and you must give room for every patent to come in. It may happen that a new drug which is introduced to-day may become obsolete in 2-3 years' time.

Shri V. B. Chipalkatti: If the drugs go out of date in 3 years' time, if that statement is true, then probably what you say is true. But my feeling is that the drugs can continue for generations.

Mr. Chairman: Some may go out of use—it is quite possible.

Shri V. B. Chipalkatti: That is exactly with regard to pharmaceutical products.

Mr. Chairman: In fact except USA all other countries even to-day have got only process patents and Germany and Japan have progressed in their scientific research due to that.

Shri V. B. Chipalkatti: May be. I don't think I am competent to decide this issue in the manner in which you perhaps want me to do. All that I would like to say is that you make the product patent also very difficult and use the existing compulsory licensing system very well and then

been concentrating on problems of investment and in relation to this, we have been drawn into topics such as foreign aid, trade and patent and copyright laws. The patent law has been one important element of the investment climate in all countries.

The current Bill is an indication of the desire of the Legislature in India to modernise India's patent legislation and to overcome what it considers to be inequities in the present patent system and also to bring uptodate certain practices which have become outmoded over the past 55 years.

In our opinion, of course,every government has the right to constantly review the laws and try to bring them uptodate in a manner which is in their own national interest. Obviously every legislature is interested in a new legislation from the point of view of its own national interest. We are delighted, as I said before, that you took some time to listen to certain outsiders who may be affected by the legislation in India. To some of the people whom I have discussed the legislation with, including the people in Japan, Korea, Taiwan, Philippines, England, France, Germany, Italy and Canada, the legislation does, in a few places, raise some serious questions. These provisions which are most disturbing to the people I have talked to, seem to strike at the very heart of the patent system and in fact, these are the only provisions which I have been concerned with.

As I said, I am not here as a patent expert but rather to discuss those provisions which will affect the question of flow of capital, flow of technology and development of indigenous research. Some of the broad sections which will affect the people are those which permit use of the patent by the government without compensation, which permit compulsory licences or "licences of right", as you call them, without any conditions for an inquiry into the ability or means of the licensee at a fixed maximum royalty and which remove specified appeals from the judicial system.

I pause here for a moment to say that obviously there are many ways of hearing appeals. Administrative agencies or administrative courts can have just as much function as a court does. The Droit Administratives of France and the administrative courts in Belgium can have all the safeguards of a judicial body. The problem as the statute stands at present is that many of my friends and colleagues feel that it would be preferable if the statute itself stated that the safeguards which one usually finds in a court of law would also be incorporated in the underlying statute. Obviously, the regulations which would be issued subsequently under the statute could provide for such provisions. I think there was no need to ask whether an administrative court would be better or worse than a judicial court. Obviously, either one can be good. It is just a question of knowing that in the underlying statute that such safeguard provisions have been made.

We have also been disturbed by the limiting of the term of patent and that this provision has been made retroactive. It seems to us that the gains by retroactivity will rather be minimal as the number of patents involved, probably most of them, have been running for a number of years. Any way, why not finish their term the day this Bill comes into effect or subsequent patents may be limited.

We also feel on the term of patent that a ten-year period from the time of filing of the specification is a very short period of time. In Algeria which probably has the newest patent law which was passed a few months ago and the term there is in keeping with the modern trend, they have put in a term of 20 years—the average probably running between 16-18 years with a trend, I seem to feel, now running closer to 20 years.

It is always difficult for a person who does not live in a country to understand the legislative structure of another country. I remember when I first came to India the Industries

Regulation and Development Act of 1951 has just been passed and at that time I have read it and, being an American and being used to our system of law, felt that a tremendous amount of power was being given to the Government. But by the end of 1952 I had modified my opinion to this extent that the law gave tremendous power to the Government but much of this power would probably never be exercised and I was right fortunately in one case because many of those provisions which were most striking have never been exercised, or if they have been, it has always been with great circumspection. However, the role of a lawyer advising a client in New York is difficult. He advises the client that this is the law. After going through the law the client feels that it is terrible. 'But they won't apply it', the lawyer says. The client will ask, 'How do we know that it would not be applied?'. The reasonable answer is: 'anyway I cannot be quite sure that the provisions would not be applied.' All that one can say is: 'based on my own experience, going back and forth to India for many years, I do not think these provisions will be invoked'. I think the Government has more powers here than they would exercise. I can tell you quite frankly that many firms telephoned me in New York before my coming here and they said. 'We read the industrial laws and are very much disturbed.' One of the laws they always refer to is the Industries Regulation and Development Act. I mentioned this because I think in the present Patent legislation there are certain provisions which also would be frightening to an outsider, but which may never be applied also—I do not know. Some of these provisions are: the section which permits the Government to take over patents, the section which permits the Government to let numerous groups use the patent under certain conditions. These conditions seem to be very harsh. Perhaps these are provisions which will not be applied —I just do not know.

The question the BCIU is concerned with in this legislation relates basically to three main categories—the investment climate, the flow of technology into India and the development of indigenous research.

Regarding the investment climate, the first point to make there seems to me is: that the Patent Bill obviously is only one part of the many many elements making up the investment climate. I don't think that if the Patent Bill was the only question this might stop foreign investment. The question is: when you put it together with many other provisions, the cumulative effect of this particular item might be to act as a deterrent to further investment. As you know, under the Fourth Five Year Plan the Government has estimated an annual inflow of 120 million dollars of investment annually. This is considerably more than what has been coming in in the past few years. It seems to us that at this stage the Patent Bill may act as an additional deterrent to a greater flow of capital. Over the past few years since 1964 there seems to be a fairly positive approach to investing in India. In fact, when I appeared before the Watson Committee on India and advised them on the situation here, my remarks were very favourable and some of you might have read that Committee's report; there is a section on India which says that there is a constantly improving climate in India. Those remarks were based upon the testimony that I gave before the Committee at that time. However, since then a number of things have arisen, many beyond the control of the Government—the death of two Prime Ministers and many internal problems; some of these have already been resolved, I think, more favourably in relation to the recent devaluation of the rupee which probably will help to increase private investment. But, nevertheless, the climate has not been extremely strong in the past two years as a result of which it appeared to us that

the current legislation would tend to retard rather than to encourage new investment.

As far as the flow of technology is concerned, I remember, while reading through the book of Mr. K. M. Pannikar on 'The Afro-Asian States and Their Problems', he put forth one of the most succinct statements on the problems of development that I found anywhere. In his book he discusses the need for technology in India. After all this was written in the early 50's and he pointed out that a country which is developing cannot say 'We would not use the latest technology' because there is already such a big gap between developing countries and the developed countries and that to use any but the latest technique will only tend to take you farther apart rather than to come closer together. That I think is a very important point and I agree completely with him that India must use the latest technology for its development. To get the latest technology in most cases India will have to go outside India. They will have to bring in this technology through patents from other countries and to get this type of technology, it seems to me, the question one has to look at in relation to the legislation under consideration is, 'Does this law act as an incentive or a deterrent to the flow of new technology?' Is there any way—in fact this is really the underlying question —by which any Government can through legislative means force an individual to deliver his technology to another country if he does not want to or are the incentives not enough. This is really the underlying question of all patent legislation. Of course, a patent is a monopoly. Of course, it gives privileges to an individual for a limited period of time. It does that because countries have developed a theory that unless this is done, technology will not flow from one country to another. Therefore, the question is: will the current legislation in India act as an incentive or act as a deterrent to individuals who have new technology and who are outside of India? As far as technology within India is concerned, obviously every country has more power over its nationals than it has over people who are outside of the country. But even then; you can't force a man to think, you can't force a man to be creative, you can't force a man to tell what he has in his own mind, unless he feels that there is an incentive to do so. There are individuals who are very altruistic who will give up all of their knowledge and all their lives because they feel their course is right and development is important. I think, however, these are exceptional individuals and this legislation cannot be enacted to affect those people because those individuals need no legislation to come forward with their own ideas to help a country develop. What do we do with people who have the technology, who have new ideas and who feel that they will not give them up unless they are given incentives, and what should the incentives be.

Now, as I flew out on the plane just 36 hours ago, I kept playing in my mind the problems which must disturb all of you—it disturbed me very much —of how this country, which has a huge population of one-seventh of the total world population and which still has a low per capita income, can find a way to see that the latest technology is available at low enough a price so that the people in the country can enjoy the fruits of it while they are still alive. This dilemma is one which bothers me very much and I have not been able to find any simple formula for that. I think if a simple formula were available, we would know about it. How then can we solve the problem? For example, in the field of pharmaceuticals, we see a new drug which saves millions of lives; we see the drug is expensive; what can we do through legislation to see that it is manufactured in India and to see that the cost of the drug is such that the average man in the street can go and buy that drug? This is the question, it seems to me,

we all are trying to answer. And yet the only system we have been able to develop for the past few hundred years of patents system has been a system which temporarily gives a monopoly to an individual and a pecuniary gain for a limited period of time through the patent. Now perhaps there is another way but I have not been able to find that way. If you try to put pressure on somebody to tell an idea, he will certainly use a secret process and you will not get it at all. If you say to him "you must do it this way", he will say "well, I will not produce in your country at all." If you say "I will appropriate your patent", he will say "fine", because that piece of paper will not teach you how to make Tetracycline, because to make that you must have the know-how, you must have the technology and you must have the money; and in addition, you really lose more if you go round appropriating than you gain. So we come back to the same dilemma. How do we find a way to get a low-cost product which is needed by people? How do we find a way for that product to be mannfactured in the country? I am afraid we still have not found the way and I don't think that a patent law which is restrictive in some of its provisions in relation to these points, will encourage or bring forth the actual movement of technology. What about indigenous research in the country itself? What about scientists within India? Does the current legislation give them an incentive to give out, to look into new technology, to develop new ideas? Once again we are back on the same question. If there is any incentive sufficient enough for a scientist here to produce the product, then the answer is "yes". If there is no incentive, obviously he will not come forward with the idea. What happened in Italy where they don't have any patent rights for pharmaceuticals? No new pharmaceutical discoveries were made. One or two new discoveries were made but both were registered in England under patents. They didn't stay in their country at all but went out of the country. Then, what about prices in Italy? Do the Italians get the drugs cheaply? No, they don't, because what happened in Italy was there were 60 people manufacturing the same product leading to very high promotion expenses and as a result of the cost of drugs was high. So the problem is still there. This is a real problem; it is a moral problem; it is not a question of law alone. And I can only say that my sympathy is with anyone who is trying to solve this dilemma. The question is how do we do it. Can it really be done by limiting the patent rights? No. I think the compulsory licensing approach is a good approach if it is used in the right manner and it has been used historically in India and in many other countries. It has been fairly successful to get products to come out. But as my colleague, Mr. Robbins, has probably mentioned here— I don't know, I was not here— compulsory licences are almost never applied for anywhere, even though they are on the statute book. So again it is a technique which has not been probably meaningful. I think perhaps Mr. Shoji Matsui came here from Japan. I was with him in Japan and we had some discussion on this. I looked into the Japanese industry situation and I think the Japanese industry is very instructive in relation to the positive aspects of patents. I was in Japan 15 years ago and 15 years ago, Japan was very flat with great destruction, with no buildings, with no industry. But to-day Japan has one of the most thriving and dynamic economies in the world. Year after year the G.N.P. was increasing at the rate of 20 per cent per annum and even this past year it increased by 10 per cent. You consider that with the fact that they have reduced the birth-rate from $2\frac{1}{2}$ per cent to 1 per cent and you will see that the Japanese development has been truly amazing.

In Japan they used the technique in relation to the investment which I found to be exemplary. They sat down and said to themselves. "What do we do? We will develop our country with our own money and with our own technology. We have fallen

behind in technology and we have no money at this stage but we want to develop." So beginning in 1950, they took out from the dusty shelves the patent legislation which was still left and which had been in existence for 85 years and they said "let us see what we could do about bringing technology" implement their patent law is one of the considerations, and most liberal patent laws have brought in technology from all over the world. They worked the patents, they paid royalties, royalties have been fairly high, but what has been the effect of it? The effect of it has been that yes the Japanese are today paying royalties of something like—I have the figure here—I think 165 million dollars a year, but in addition from this year they are beginning to get back an amount equal to 8 per cent of royalties paid out through royalties on patents and what is much more important than that is their own scientists, having used the technology they have got from abroad, have developed new patents, have developed new processes and today the exports of just two commodities from Japan more than compensates for the total royalties that they pay and the economy of the future will be less and less dependent on foreign technology and more and more they will be creating their own patents and exporting them all over the world and in fact, you know, in this country, that the Japanese have been here and have been very much interested in investments here. I found Japanese in Korea, I found them in Taiwan. They have gone to Indonesia, exporting technology, exporting technicians, exporting scientists. So to me, this is a good example of what can happen with good positive patent legislation. The patent alone will not do this. It is not for me to suggest that any country that had a good patent bill would develop dynamically. One can say if other factors are good, a good patent bill can be a contributory factor. For better or worse, industrial development is intimately interwoven with patent rights. It is in this way that a country with a favourable patent law would be able to attract all other elements essential to industrial development. At the moment, India finds itself in the midst of extraordinary development problems. These problems cry out for innovative approach. However, it would be a short sighted innovation which would curtail the flow of investment, limit the flow of technology and diminish the level of integral scientific and technological research. Patent rights are inextricably linked with the flow of capital, know-how, skill and experience. Tampering with industrial or property rights at this time may prove to be a major deterrent to rapid development.

Now lest it be misunderstood because when one speaks for a short time one tends to talk about negative things in general I think that the Patent Bill is without exception, that it shows a tremendous amount of work and it is a very positive step forward. My only point relates to a very limited few sections of the bill and those few sections are, as I said earlier, ones which raise questions in the minds of people—the questions of: Will the Government take over patents without compensation? Will other individuals be able to use their patents even though they do not have enough know-how and do not have enough money? Is the absence of judicial review in redation to some sections so fundamental that people would be aggrieved? I do not know perhaps you have other provisions in your mind which will be in the regulations that I am not aware of and is it really necessary to make the new patent law retroactive in relation to existing patents.

Well, I am afraid my statement perhaps has been more general than the very specialised ones of people who have been heads of Patent Offices like Mr. Matsui or who have been leaders in the Patent field for the past 35 years like Mr. Robbins or who have been expert chemists like those you had from Germany but B.C.I.U. did feel that it would be

helpful if you would allow us to express our opinion and I must repeat once again, we feel very indebted to you to permit us to come to your legislature to discuss our point of view. I hope that my Government will be equally kind and hospitable in inviting people from your country when we discuss our patent legislation which is being studied by a Special Commission at the moment and of which Mr. Robbins who was here is a member.

Thank you very much, Mr. Chairman.

Shri Kashi Ram Gupta: The learned Advocate has suggested that there should be proper climate. I want to bring to his notice that so far as patents other than pharmaceuticals are concerned, the present Bill has got 14 years from the date of completion of the specification while the old Act provides 16 years from the date of application and hardly there may be a difference of about one year or less than one year. Therefore, I want to know his opinion about this aspect of the Patent Bill.

Mr. Robert Meagher: In relation to the 14 years provision, I do not say that this is a major hindrance. The 14 years provision, I think, is a modification away from the direction of the world trend which is towards increasing the patent period. However, I do not say that a major problem arises in itself from going from 16 to 14 years, but I might state here that one of the difficulties of the current proposed legislation relates to the period from which the time begins to run. The filing of the specifications is not the time when you have a patent. It seems to me to be preferable to have the time run from the time of the sealing of the patent.

Shri Kashi Ram Gupta: My point is under the old Act, it is 16 years from the date of application and the present Bill has got it from the completion of the specifications. Actually the difference will be hardly one year, but if you say that it should be from the date of sealing in this case as well, it will mean more than 16 years.

Mr. Robert Meagher: I think if it was more than 16 years it will be closer to the average which is probably 17 years world wide and which is now, in many countries, being extended to 20 years.

Shri Kashi Ram Gupta: Are you aware of the fact that Japan has got 15 years only?

Mr. Robert Meagher: Japan does have 15 years only. United States has 17 years and other countries have different periods. However, the newest legislation—the Algerian Bill—which has just been passed, does have 20 years and other countries are considering—though they may not pass—bills which will increase the period from 15 to 20 or from 17 to 20 and so on.

Shri Kashi Ram Gupta: Are you aware of the fact that Italy has got a Bill now in Parliament, which gives only 10 years for pharmaceuticals.

Mr. Robert Meagher: Yes. I am aware of that and there are 3 or 4 other countries which already have legislation existing which gives only 10 years.

Shri Kashi Ram Gupta: There is a Model Law on inventions given by the B.I.R.P.I. This Model Law on its page 49 says that a patent can be for at least 10 years from the date of sealing of the patent. The only difference is they say it can be for 10 years at least and in our country, seeing the conditions here, it can be for 10 years quite right. This is the only difference which means that we are not going against the basic point raised in the Model Law.

Mr. Robert Meagher: If the Model Law says 10 years at least, in India this could, in my opinion, certainly be 12 to 14 years rather than 10 years. Under the present statute it is from the date of filing the specifications. If you keep the present language in the legislation, it would seem that you would have to use 14 years to be assured of 10 years.

Shri Kashi Ram Gupta: If the present Bill is amended according to you, then it would be 10 years from the date of sealing. Will it be agreeable to you?

Mr. Robert Meagher: It would be much more favourable. We are talking how long does it take from the time a man gets a patent and begins to sell. From the moment a patent is sealed you do not begin to make money or you do not get the return. The standard should be that when an individual makes a fair return of his patent, the patent should cease. Arbitrarily, we have to use a period of years for different patents. If you talk of 8 years, then obviously you reduce the patent period considerably. So that would depend on how long you have to work a patent in India and how much time he is given to get a fair return of his investment.

Shri Kashi Ram Gupta: In some countries concerns having their own research and at the same time enough capital to work in a regulated way, and therefore research expenses and the expenses for invention of patents are part and parcel of the whole year's programme. They are allowed as revenue expenses in Income-tax law. You cannot say it is an isolated case.

Mr. Robert Meagher: In relation to that point, as you know, our structure is set very much on a cost accounting basis. If we have research going on in relation to one particular item, it would always be listed on one account. We know how much the cost of doing that is; knowing the costs we cannot estimate the profits on it. Obviously, when we deal with many products it becomes more and more difficult to separate then out because some expenses must be allocated to all items. However, we try through our system to have some idea of the cost on each item, so that the research costs may be listed as business expense in our tax returns. This is one of our incentives which we have used to encourage people to invent. Perhaps I am not familiar enough with your tax legislation. Perhaps that sort of incentive is also necessary here. But I am not here speaking about the Tax Bill today.

Shri Kashi Ram Gupta: Now, when it is part and parcel of the whole structure and you say it is not easy to find out separately what the cost will be on each item, then the big companies can afford to have a patent incentive even when the period is about ten years.

Shri Robert Meagher: It is like comparing a rich man and a poor man. I do not know whether that is true or not. A man who is poor may give up an invention because he may not be able to carry on for long. A man who is rich can give more time to make an invention. Most of the large-scale research done in the USA is not by the small companies but it is done by big companies. And we have found that the creativity comes because people give time and spend the money to do research. I do not think you should penalise a man because he is willing to devote a large percentage of his time and money for research.

Shri Kashi Ram Gupta: Should the period be reckoned in connection with the total cost structure so that the amount may be made up within that period?

Mr. Robert Meagher: Actually I am not qualified to speak on price structure which is a highly technical question in relation to patents. There are all sorts of conflicting testimonies, in which pharmaceuical companies claim that this has been so much for

research and they get a small return. One of the reasons this information is not readily available in the USA is because it is a comparative information and we do not have the problem of high costs because we have income-tax which takes care of high profits. If you make high profits people are taxed for that. I do not see that this question really is that key to an understanding as to how long a patent can pay.

Shri Kashi Ram Gupta: You say the business profit should be there and patent is only a fraction of it. There are other hurdles more formidable than patent. Now even if Patent Law is framed according to their wishes they will come with other difficulties. Therefore, in the context of this, when patent is a small fraction how is it they are not looking on these things from that angle?

Mr. Robert Meagher: We have already spent many hours discussing each of these questions including import duties, export duties, management, spare parts, raw-material sources, etc. It is not that we are discussing these questions today. We are discussing these questions every day. I have been discussing the same questions with Mr. Bhootalingam, Finance Secretary to the Government of India. When your Prime Minister came to the U.S. I met her on three occasions in New York; when your Minister for Planning, Mr. Ashok Mehta, came to the U.S. I met him and discussed these questions. It is not that we are not discussing these questions. We are trying. The obvious reason why we are discussing patent here is because it is important. When I say it is one of many things I do not say it is un-important. If it is un-important I would not be here.

Shri Sham Lal Saraf: The hon. witness knows that a number of witnesses have come before the Committee. He has confined his position to the following four items:

—permit use of the patent by Government with compensation.

—permit Licence of Right without enquiry into the means or ability of the licensee at a fixed maximum royalty.

—Remove specified appeals from the judicial system.

—Reduce the period of validity of existing patent.

May I know from these four points of view what does he considers to be 'out--moded practices' which are to be taken into consideration.

Mr. Robert Meagher: Perhaps the terms 'out-moded practice' was a wrong one. What I felt was a reduction of period was out-moded *i.e.* the term of the patent reducing to 10 years in relation to pharmaceutical industry, I think, is going against the world trend.

Shri Sham Lal Saraf: I only wanted to seek clarification, that is, when you said it is understandable that out-moded practices are done away with or at least amended in order to suit present day requirements and keeping that in view I would like to know from the above four points of view what would you consider to be the out-moded practices which you would recommend to be amended or done away with?

Mr. Robert Meagher: I do not think I linked together these four points with out-moded practices. If I did, it was not my intention. What I did feel is under clause 48 where the Government may use the patent without compensation I do not think this makes very much sense to me. I think Section 46 of U.K. legislation is preferable. I do not deny, under specified limited conditions, Government exercising rights which are necessary in the national interest for a limited period of time and it seems to me that in England when tatracyclin was bought from Italy the patentee was compensated. So I will suggest that under Section 48

there should be compensation for use of a patent.

Further, I think that the idea of a fixed maximum royalty at 4% of the net bought ex-factory price is arbitrary and obviously any system of settling royalties has to be arbitrary but it is interesting that India is the only country in the world that has set a maximum royalty price. Now I do not see any need for this. I think there is a way of determining in particular cases through discussion, through appeals, through hearing, etc. what would be a fair royalty. In most countries they let patentee, once licensed the patent, enter into an agreement to pay what he feels as a fair price for it. I know this is a very complicated question in India and it is for reasons which are not directly related to Patent Law. If you wish to do business in India and you want to have equity partnership in a company—frequently there is a question of getting equity partnership—the question of royalty price becomes irrelevant. In other cases you give up know-how or a patent right for a royalty each case goes to Ministry of Finance and there are discussions. Again it seems to me, if I would be advising your Government, it should handle foreign investors rather than handling foreign investments. I would leave them much more ambigous and interpret some results but the results should come administratively through the Ministry of Finance and not through a statute. So I do not feel it is necessary that that percentage should be put in the Bill.

Shri Sham Lal Saraf: Now, for instance, in the case of the Government where bulk purchases of pharmaceuticals and drugs are needed for Government requirements and the patent holder or the firm that has registered patent is not in a position to supply adequate quality and quantity to them, do you think, at that time, Government will be justified in attaining this authority under the Law to get the supplies from outside the country or from those patent holders elsewhere?

Mr. Robert Meagher: As I understand the question, please correct me if I am wrong, what you are saying is if Government wants to buy drugs in a bulk manner because of a situation, let us say a cholera epidemic, and Government wants to get vaccine for cholera and the company supplies them all the cholera vaccine that they can and they have to buy from outside the country should the Government have to pay the compensation?

Shri Sham Lal Saraf: The right which the Government has attained under the present provision, do you think that in those circumstances it is justifiable?

Mr. Robert Meagher: I think that if there is a major epidemic, if there is a war, if there is a flood, if there is a drought, if there are any of these many things which can arise before any Government, and it is a tremendous emergency, then, obviously, one would feel that Government should have powers to act in those cases. I think, however, that those provisions could be explained in greater detail in the Bill; I think they should be specified in the Bill, and I do not see that there is any problem in doing so.

Dr. C. B. Singh: You have elaborated on four important points.

One of the provisions in the Bill seeks to differentiate between drugs, chemicals and other patented articles so far as the period of the patent is concerned. Formerly, the period used to be 16 years for all patents; now, we have sought to bring it down to 14 for other items, and 10 for drugs, chemicals and food articles. What do you think about this kind of differentiation in regard to the period of the patents?

Mr. Robert Meagher: Personally, I do not see any need to differentiate between the two. However, this is a question which it seems to me each country must decide within its own context. There may be factor's here which I am unaware of, but it does not seem to me that in most countries this

distinction is made. However, there are some countries where distinctions have been made in relation to pharmaceuticals and food articles. The provision which you have in this Bill in regard to chemicals goes beyond what any other country in the world has in relation to its breadth of coverage; so far as pharmaceuticals and food products are concerned; when taken out into a more limited context, there is a distinction, in a number of countries. Whether there should or there should not be is a question obviously within the context of each country, and obviously, this committee is better equipped than I am to answer this question.

Mr. Chairman: Your country has also appointed a committee to go into this question.

Mr. Robert Meagher: My country has appointed a committee to go into the question of patent law in general.

Mr. Chairman: And for also reducing the period of patents for drugs etc.

Mr. Robert Meagher: One of the suggestions before that committee is to reduce the period in respect of drugs.

Mr. Chairman: Canada, New Zealand and South Africa also have appointed special committees.

Mr. Robert Meagher: That is right; as a result of the Kefauver Committee hearings.

Mr. Chairman: New Zealand agreed for restriction on drug patents. Canada suggested abolition of drug patents. In the USA, on the Bill it was contended that three years would be an ample time to recover the research outlays, and a maximum royalty of 8 per cent was suggested; there was also a suggestion for unrestricted licence which included grant of technical information required for manufacture of the patented item. The Simon commission in South Africa suggested five years for drug patents.

Mr. Robert Meagher: A number of suggestions have been made in different countries. As regards the one you mentioned in relation to the USA, though they were introduced by the Kefauver Committee, they were all defeated and rejected by the legislature.

The question here is one of emotion at one level and of real concern at the other, and they are mixed together. The problem arises this way. You travel in the country and suddenly you come up against a situation, and you see people in a horrible situation and they need drugs, but they do not have the money to pay for them. Immediately, you say, 'We must find some way to do this'. But there are a number of ways in which it can be done.

Mr. Chairman: The same thing happened in the UK also. Immediately after the second World War, UK had authorised a particular company to import a particular drug. One of the patentee companies went to the House of Lords and filed a suit against the UK Government, and the Lords held the case in favour of the UK Government. I suppose you are aware of it.

Mr. Robert Meagher: Was it not the tetracycline case?

Mr. Chairman: Yes.

Mr. Robert Meagher: That was just recently; it is a relatively recent case. The decision came down in January, 1965. I was in India at that time.

Mr. Chairman: Almost every country is trying to reduce the period of the patent in relation to drugs and food articles.

Mr. Robert Meagher: But in England, the following year, namely this year, they have stopped importing that drug from Italy because they found that the quality of the goods that they were getting from the unpatented sources was bad and unreliable, and in addition they felt that this was not the best way to handle it.

investment in India; what I think is that the introduction of a new piece of legislation in this field has an effect on the investment climate.

Shri P. K. Kumaran: Do you know that in India our experience has been that because of these patent rights which are already existing, processes developed by our scientists we are unable to use? So, it is only to create conditions for exploiting the know-how available in the country that this Bill is introduced. Why do you think it will not help India?

Mr. Robert Meagher: This question is a highly technical one. If there is a reasonable patent law, there should be reasonable protection for the person who first develops a patentable item. I do not think we should be able to avoid this by using legalistic techniques, which actually go against the underlying purpose of protecting the patent for the first person.

Shri P. K. Kumaran: Is it not a practice in the drug market to make slight changes in a drug and market it as some other drug and make huge profits?

Mr. Robert Meagher: No. They would rather license it to four or five companies, as in the case of tetracycline for example, and get royalties from them.

Shri Peter Alvares: In developing countries there is always concern for investment incentives as well as development in technology. In the pharmaceutical industry out experience is that the patent system has been utilised to import drugs more or less at the intermediate stage, with the result that the process is not worked out here. Licence of rights tries to take care of this situation. Does not the provision for licence of rights provide for the working out of the technology inside the country so that the country can develop as fast as possible?

Mr. Robert Meagher: Actually, let us put the question in a more realistic context. In 1955 I came to this country on behalf of a pharmaceutical company, who happened to be a client of my law firm in New York. At that time we were just having some exploratory discussions here, and I found that the Government at that time would not permit these people to come to India. They were going to provide almost new technology, but they could not come in. We could never get permission under your Industries Development and Regulation Act. So, these questions seem to be theoretical, because, apart from your patent law, you have got a Ministry of Finance which does not permit just anybody to come here.

Secondly, as far as these drugs are concerned, the steroid drugs are now being made in India and it seems to me that more and more of the drugs which were imported are being made here. I do not know if you can force a company to make these drugs in India.

Now, I come back to the same question. There is no way to force a man to do such and such a thing for less than what he considers he deserves. If he does not want to give it to you, you may say, "Leave this country" and then he will go away. The point is this. We go back to the patent system, an arbitrary, system prevailing from 200 years, and gives an individual a temporary monopoly for a period of time. At the end, what do you gain? You gain firstly, a new factory; secondly, new technology; thirdly, a number of Indian scientists and technicians, because under your laws you require Foreign Companies to train Indian technicians. These technicians use the patented processes and they develop new processes which they in turn patent as the Japanese have done.

There are only three or four countries in the world where the majority of patents are not held by foreigners. I think Japan, Germany and the United States are the only countries in the world where the majority of patents are not held by foreigners. In the United States, it is only 20 per cent; in Germany and Japan, it is 30 per cent which is held by foreigners, but in countries like Canada, it is 90 per cent as it is in India. The figures generally run from 65 to 90 per cent, where patents are held by foreigners. The holding of patents by foreigners is neither good nor bad. The question is whether that technology of patent is developed in the country and whether the people in the country develop their own ideas and create their own products which in turn gives them the ability to create new patents which are then exported to other countries.

Shri Peter Alvares: You have referred to the investment climate in India. From the liberalisation policy mentioned by the Finance Minister during the last year, you will see that the investment climate is so good that there is hardly any reason to fear that the new provisions of the Patents Bill would retard the investment. From the survey of the Reserve Bank in respect of the profitability pattern, it is seen that while the profitability of the USA and Britain in India is the highest in any country in the world, in their domestic sphere it is the lowest. Therefore, the American and the English investment in India earn them the highest profitability of any investment in any other country in the world, and in both these countries the return on investment in domestic sphere is the lowest profitability.

Let me give you some other figures. The Government of India have circulated to some of us in the Finance Consultative Committee, the figures of investment for the years 1962, 1963, 1964 and 1965. As far as the United States and the United Kingdom are concerned, the investment is the highest; in 1962 it was 10.9 million; it was 13.29 million in 1963; 5.84 in 1964 and 11.68 for the last year, 1965. In the United Kingdom, it is similar. So, the table of investment within the last five years shows an increase both for the United Kingdom and the United States. Since then, the Finance Minister has given certain concessions for regarding the profit and ploughing it back and so on. In view of the increasing ratio of investment in the United Kingdom and the USA companies, how do you have the fear that the Government of India's proposal as contained in the Patents Bill would retard investment?

Mr. Robert Meagher: Your question is a long and complex one and I shall try to answer it briefly. First, in relation to the profit figures, these figures caused me some concern for a period of time because we could not understand it, and many of my clients are getting back something like two per cent on their investment including one of the largest U.S. investors in India. Last year, the profit went below two per cent on investment. These are rather curious. The Reserve Bank figures are misleading. There are certain investments that were made a long time ago in India and the returns were very good. The investment that has been made in more recent years, and the figures of expenses are not quite as good, but I find that the profitability is not the only criterion for investing, though obviously it is a very important criterion. I think that the average flow of investment shown in the *Economic Times* of India dated 28th December, 1965 will reveal that the annual average of 1956 to 1961 was 82 million dollars. In the years 1962 to 1964, it was 62 million dollars; in 1966, it dropped down to 50 million dollars. I feel that the situation has not been good

for a number of reasons, and really, the problem is one which is very difficult and it will take a long time for me before this Committee to discuss these things. But in brief, let me say that it disturbs me very much, as a person who likes India. In Taiwan, which has a population of 13 million people, there is more foreign investment currently than in India which has a population of about 500 million. Indian market must get into South-east Asia and open their investments there and India must export to those countries. Otherwise, all these will probably be lost to the Chinese in Taiwan. India must develop her industry and export.

I have just come from Korea and Taiwan. I saw there a tremendous surge of investment and a client of mine who had been here said that he has found the investment climate much more favourable there. When I say this, I am not being theoretical. I am not suggesting anything in a Machiavellian fashion. But I may say that those big firms of the United States are interested in India but they will go wherever they find conditions to be best. The BCIU and others are interested in India's development. Some who are not have yet may invest here some day. But people like the ESSO, Union Carbide, ITI and Firestone are here in India. They are not people who might come here. They are here because they like India and they want to see India develop. They want to see the investment climate develop. They have been here for a number of years and they would like to see India develop quickly, and they are interested in seeing if there is some way of moving ahead more quickly.

The point made about the Reserve Bank of India's figures about profitability may now be referred to. They may be right or wrong, but that will not increase the investment. I was sent down here to speak on the Patents Bill. I want to make my points here on the Patents Bill, and not on foregin investment. If your Committee is on foregin investments, I will be glad to discuss each of those points on foreign investment.

Shri Peter Alvares: You said that this has an effect on foregin investment. The foreign investments in India are on the upgrade, and so that is a relevant point here. The American and English people are also investing here in a larger way and so, I referred to it. It may not be very important to you, but it shows that the profitability of American and Einglish enterprises here is high. I am not saying this with any hostility, but their investment profitability is the highest in India, and their investment ratio and their profitability are much higher than their domestic produce.

Mr. Robert: Meagher: The total from my country is 250 million dollars. It is spread over 15 to 16 years. In fact, some of it came before that. The Union Carbide has been here for many years.

Shri P. K. Kumaran: You want India to become like Taiwan?

Mr. Robert Meagher: Only to the extent of being able to tap the dynamic investments and gain markets overseas as Taiwan is doing. I am not interested in the political aspects.

Shri A. T. Sarma: You have said:

> "It is not likely that a restrictive patent bill will encourage Indian scientists and technologists to carry out fundamental research in India."

Would you enlighten us on this expression "restrictive patent Bill"?

Mr. Robert Meagher: Suppose an Indian scientist sits down, spends a number of years and develops a new drug. If the day he introduces it

everybody in the country can start producing it, there is not going to be any great incentive to produce a new drug; he might as well invent something new in steel where he will have some protection. The Indian patentee is in no better or worse position than the foreigner. The Indian scientist doing research in fields which are most restrictive like pharmaceuticals may end up giving the product of his research not to India as you expect but to other countries where his patent rights can be protected. This happened in regard to Italian drugs.

Shri A. T. Sarma: The provisions of the Bill are based on the recommendations of the commission appointed by the Government and we consider the provisions are in the best interests of India. We do not consider it a restrictive Bill. Do you agree?

Mr. Robert Meagher: If I agreed with it, I would not have made the remarks I made. Certainly in this case, the decision is not going to be made by me. I am just giving my comments and they may be rejected if they are not effective.

Shri A. T. Sarma: Do you suggest we should follow the same policy as in Italy? In India there is already a patent law whereas Italy has no such patent law.

Mr. Robert Meagher: I think the existing legislation in India in relation to the points I mentioned: is better than the proposed new Bill,

Shri A. T. Sarma: Do you want the existing Act also to be abolished?

Mr. Robert Meagher: I have never suggested that.

Shri A. T. Sarma: There is a vast difference between Italy and India. Do you agree?

Mr. Robert Meagher: Your new Bill in relation to pharmaceuticals is more restrictive than the legislation now in force. As a result of this bill, you may limit the amount of research in pharmaceuticals and certain chemicals.

Shri A. T. Sarma: In your memorandum you have referred to our fourth five-year plan. Do you think the plan will be economically affected if this Bill is passed?

Mr. Robert Meagher: Your fourth plan envisages a certain amount of private foregin capital. If you pass a patent bill which tends to become more restrictive, that will be one more factor which might limit the flow of foreign capital.

Shri R. P. Sinha: You say this Bill will hit Indian research and Indian scientists and Indian industry as well. Suppose we have a chapter separately dealing with patents and discoveries made in India separately and thus discriminate between those patents and other patents and discoveries made outside India. Is it the theoretically possible?

Mr. Robert Meagher: I do not know whether it is possible or not; I will have to think about it. I am not familiar with any legislaion anywhereelse in the world like that. Even if it is possible to do that, I do not think it would be a worthwhile exercise because it would be going against all international trends and conventions which presently exist.

Shri R. P. Sinha: Suppose we have such a provision. Will it debar us from becoming a member of the international body?

Mr. Chairman: I think it is not a proper question. It is hypothetical.

Shri R. P. Sinha: Our experience has been that certain patents taken out in India have been abused and used to the detriment of the national interest. Hence the provisions in the Bill have been made to correct

those abuses. If we give certain reserve powers to the Government to be used only in extreme cases of abuse, what psychological effect do you think it will have on the foregin investor?

Mr. Robert Meagher: The real question here is that there should be a fair hearing for any individual whose patent is going to be revoked. I do not think it should be an arbitrary decision or a decision made just by the Controller of Patents. I think the individual should be notified that it is the Government's intention, because of the following reasons, his patent should be revoked as it is against or in the detriment of the national interest of India, and asking him to appear within ten days so that he may be properly heard. He may be allowed to bring witnesses if so required. After that, he should be able to appeal to a court of law and only if the court agrees with the decision should his patent be revoked. The question here is not to encourage individuals to act against the interests of the country which has granted the patents; the question here is to see that there is a fair hearing and rights are not taken away from individuals for arbitrary reasons. If for other reasons the Government thinks it proper to revoke the patent, fair compensation should be paid to the individual. That is the real concern, and the concern is not that a man should be able to do bad things in a country and he may be excused just because he has got a patent.

Shri Bade: You have said that this Act should not be retroactive. The main purpose of bringing this Bill is to fight against monopoly. The foreign manufacturers, after taking patents for processes from R-1 to R-37, block the Indian manufacturers or , inventors from doing anything. Then they create a monopoly and exploit the Indian market to the extent of several crores a year. They also do not manufacture the products in India and they import the patent medicines from abroad. Therefore, why should not this Bill have retro-active effect?

Mr. Robert Meagher: The problem with retro-active pieces of legislation, international or even national, is basically this. An individual enters into an agreement. He comes into your country on certain conditions. You tell him that under the present patent law he may have patent for 16 years. In good faith he comes and develops the industry here. If all of a sudden, after three years, you tell him that from 16 years you are cutting down the period to ten years, and that too from the date of last filing the specifications, and because he has already completed three years he will have only another four years, that would not be fair. My real objection here is; I do not think it is a good procedure for any Government or any individual to enter into an agreement with another person and then basically change the terms of agreement unilaterally. This is not the real approach. If monopolies are your problems, and to some extent in India monopolies are the problem, why not have a restrictive practice Acts as in Germany, Britain or France, like the Sherman Act, the Clayton Act in the U.S. and so on? Why do you not think of other ways of tackling that problem. To amend the patent legislation is a very oblique way to tackle this great complicated problem and it will only destroy the mechanism of patent.

Shri Bade: Look at clause 90 of the Bill. Are these not reasonable grounds?

Mr. Robert Meagher: The grounds are there. If you turn to clauses 84, 86 and 89, the question is one of having proper appeals before a judicial body. Clause 84 does not permit that. Clause 84 provides for appeal to the Central Government. The proper approach is to allow him to have a judicial appeal. The Government, obviously, has the power, any time

it feels that patents in general are not in the national interest, to do something about it.

Shri Bade: Even if the patentee is not able to manufacture in India, it should not be revoked?

Mr. Robert Meagher: What I am saying is, if an individual violates the regulations, you should give him a hearing, allow him to appeal against the decision and with the approval of the court revoke the patent.

Shri Bade: All the foreign pharmaceutical manufacturers have objected to this. I have seen that many of the firms, in Bombay and other parts of India, are importing everything from abroad. The know-how is never known to our scientists.

Mr. Robert Meagher: There are no pharmaceutical companies today in India who do not bring in new technology, because your Government would not let them come in.

Shri Bade: May & Baker have taken 57 patents and they are exploiting only two at the cost of our poor consumers. Is it not our duty to pass such a legislation?

Mr. Robert Meagher: Let us suppose that they have only two patents in India and the rest 55 are outside India. Would you be in a better position then?

Shri Peter Alvares: Then anybody can work the other 55.

Mr. Robert Meagher: It is not so easy. Patents are not patents on paper. This is not the way patents are worked. If you do not have the technology, the know-how and the capital, even if you have all the patents in the American Patent Office, you would not be developing industries necessarily.

Shri Bade: You have said that there will be no large-scale investment climate for foreigners. With 45 crores population and devaluation, is there not sufficient attraction for investment?

Mr. Robert Meagher: If you are asking whether devaluation is not an incentive, if I had invested 150 million dollars in India and put it into rupees, I would be getting 35 per cent less today than what it was two months ago. If I am going to bring in new investment, obviously it would be an advantage.

Shri R. Ramanathan Chettiar: In the preface to your note you have stated:

> "The patent Bill appears to be moving against the trend to encourage new investment in India."

You have ended by saying:

> "Tampering with industrial property rights at this time may well prove a major deterrent to rapid development."

How have you come to this conclusion?

Mr. Robert Meagher: For example, if you give a licence of right to a man to develop a new drug in India, it will discourage foreign companies from making invests in India, specially in the pharmaceutical industry, because they know that at any time the Government can give a licence of right to anybody in India to manufacture such drugs. From that point of view, there is a limitation to foreign investment or flow of capital. Then, when I speak of property rights I mean patent rights.

Shri R. Ramanathan Chettiar: How does the Bill interfere with the industrial property rights?

Mr. Robert Meagher: Now the property right or patent right runs for a period of 16 years. If you change it down to 10 years and then, in addition, make a licence of right,

you interfere with the property rights.

Shri R. Ramanathan Chettiar: In other words, you want perpetuation of monopolistic tendencies on the part of big cartels like Parke Davis and Pfizer.

Mr. Robert Meagher: The first largest 15 companies in India are not American companies. They are Tatas, Birlas, Sri Ram, Dalmia Jain and so on.

Shri R. Ramanathan Chettiar: I am speaking of pharmaceutical and drug industry and I enquired whether the bringing down of the period from 16 to 10 years will affect the industrial property rights. It seems you want perpetuation of foreign interests in the drug industry.

Mr. Robert Meagher: I want the patent law of India to be like the patent law of any other country, so far as the period is concerned, so that technology can be shared, because we have not found any other way to do it. By the very nature of it, patent is a monopoly. By that patent you give a man a monopoly for a fixed period of time. I am in favour of patents and they always involve monopoly. However, we do not know any other way of transferring technology without having monopoly.

Shri R. Ramanathan Chettiar: In reply to a question you stated one of your firms, whose investment is of the order of 90 million dollars did not get more than 2 per cent. I do not know to which industry you are referring to.

Mr. Robert Meagher: Not pharmaceutical industry.

Shri R. Ramanathan Chettiar: I will confine myself to drugs and pharmaceuticals and I will give you certain figures to allay such fears on your part. If you take the Reserve Bank of India Bulletin for November 1964 you will notice that in 1962-63 the total investments of foreign interests in the field of pharmaceutical and drug industry was of the order of Rs. 14 crores and they have taken away as dividend Rs. 2 crores and Rs. 5 crores by way of royalties, making a total of Rs. 7 crores on an investment of Rs. 14 crores. This is the only country which enables you to get a return of 50 per cent on your investment.

Mr. Robert Meagher: The same argument was given in my country before Senator Kefavour by the pharmaceutical industry. Well, I suppose, if one has money for investment in shares he would be well-advised to invest it in pharmaceuticals. I do not see its relation to this question. I have no argument because I do not have all the facts. I have no doubt that profits in some industries have been very good. I have no doubt that in pharmaceuticals they have been fairly good.

Shri R. Ramanathan Chettiar: Which is the industry you are referring to?

Mr. Robert Meagher: I cannot mention it. It is not pharmaceuticals.

Shri R. Ramanathan Chettiar: In my experience of a long period I have not seen even a single instance where a foreign investment gets a return of 2 per cent.

Mr. Robert Meagher: After the meeting we can discuss it. I do not want to give my client's information in the Committee. As far as the actual profit question is concerned, is there any way legislatively through the patent process to limit the profits? Secondly, will it come in the way of flow of technology in the field of drugs.

Shri R. Ramanathan Chettiar: That is not the only object with which this Bill has been drafted. We want the prices of life-saving drugs to be brought down to reasonable

levels so that they can reach the poor men of this country.

Mr. Robert Meagher: Price control is not and should not be the function of the patent law.

Shri R. Ramanathan Chettiar: We also want to curb the monopolistic tendencies of some companies.

Mr. Robert Meagher: You have made two points, prices and monopolies. I would suggest that the proper place to handle prices and handle monopolies is the price legislation and the monopoly legislation. You already have an Industrial (Development and Regulation) Act. A section of that Act says that if the Government feels that the distribution is unsatisfactory or the price level is high, it may step in and control distribution and prices. It is already there in your legislation. You do not need a patent Bill to do it. By this provision you are putting into the Patent Bill things which are not relevant to patent legislation. I am not arguing the philosophy of monopolies which I too do not happen to favour. But that is another question.

Shri R. Ramanathan Chettiar: You are a good public relations officer.

Mr. Chairman: Do you, as a lawyer, agree with the conclusions of the Kefavur Committee report?

Mr. Robert Meagher: There is a majority report and a minority report. Which one are you referring to?

Mr. Chairman: The majority report.

Mr. Robert Meagher: I do not agree with the majority report. I have to qualify that statement. The Kefavur Committee reports are based on a long series of hearings. They have said in the report that there were certain problems and certain abuses. I think to some extent probably there are problems and there are abuses. The question is whether the Kefavur Committee report fairly reports the findings that took place before their own Committee. In a hearing that goes on for months, naturally people from both sides come and report. So, in the report you should at least mention what the other side have said. You may not agree with it, but at least you should state what they said. The reason why as a lawyer I object to the Kefavur Committee report is that I do not think enough consideration was taken of the view expressed by people who opposed what Kefavur was doing. As a lawyer I am interested in balancing the two options—the need for drugs and pharmaceuticals and the need for incentives for people to make inventions. These two should be constantly balanced.

I am not satisfied with the patent legislation as solving this problem. I am not sure that the whole patent approach is the right solution. If we go in for a Patent Bill, it seems to me that the patent Bill should adhere to the fundamentals of patent, namely, protection, monopoly if you want, for a fixed period of time so that you can create incentive for bringing out inventions.

The problem is how do you get these drugs, which are life-saving and important, to the broadest number of people at prices which are reasonable. One way may be to increase the Government Health Serviecs, as the English have done. But when in a country so much of the budget is already devoted to health and development when not enough money is available with the Government for providing better health services, what should be done? That is the problem in your country.

Mr. Chairman: As you have put it, that is the problem. We have a huge population. We want medicines at cheap prices so that they can reach the common man. The foreign

patentees are importing only the intermediates and they have not started manufacturing drugs here; nor have they established any research institutions in the country. The main object of our Patent Bill is to promote research and develop industries. That has failed and that is why we want to amend the law and these are some of the amendments directly aimed in that direction.

Mr. Robert Meagher: I understand that and if I thought that what you were doing was going to achieve that, I would say, "Good".

Mr. Chairman: That can be seen only by the results.

Mr. Robert Meagher: That is my opinion and that is all I can offer.

Though I understand why it is being done, I must say that before I came to discuss this Bill, one of the main things that I could see was why at this time India wanted to introduce this legislation. My conclusion was, as I have stated to you, that it seemed to me that you were trying to solve the problem of prices and supply of drugs to a large number of people. I am not at all opposed to that goal. My question is whether by these amendments to the patent legislation you will be able to achieve this goal. I, unfortunately, feel that this will not do. The reason why it will not do is relatively simple. There is no legislative way in which any legislature in the world can force people in other countries to give them their technology and their money unless they give them in return what the people want. It is just difficult. I do not know the way to solve this problem. I appreciate the reasons for the effort but I just do not feel that this would be the way to do it. I can assure you that if I do find the way, I should be very glad to share my ideas again with you because, I think, we all hope to find some way so that poor people can at least have good health.

Mr. Chairman: That is our main object. You had the patent law in the USA for nearly 300 years but all the research has been done only recently, that is, in the last 20 years. Why did the patent law in USA not promote industry and research all these years?

Mr. Robert Meagher: The whole development of science in recent years has changed radically. We have made a number of fundamental breakthroughs in relation to science. Just as the quantum theory was developed, there was a sudden breakthrough in a number of fields in science and that has certainly got a cumulative effect. I am not an expert in the history of patent legislation to be able to suggest why in the past this technique has not paid, but one of the reasons is obvious. If I wanted to come to India 300 years ago from New York, it would have taken me months and months.

Shri R. Ramanathan Chettiar: 300 days.

Mr. Robert Meagher: Today if I want to come to India, I can probably be here in 24 hours and in the 1970s if I want to come to India, I will probably be able to come here within eight hours. The narrowing of the gap in the world between people has meant an exchange of ideas, technology and so on as a result of which there has been more development. For that reason, I think, patent is now getting outside of the national boundary and there is more advance.

Mr. Chairman: May be, it is an unpleasant question, but I would like to ask whether it is because you confiscated all the German patents as enemy property that so much of research and development took place in America.

Mr. Robert Meagher: I do not think the American research has been dependent upon German research. Although you will find that Japanese and German patents were worked as

a result of the war, however, it would be a bit unfair to suggest that. If we take pharmaceuticals, out of the 450 patents issued during the past 20 years, 370 have come from the United States.

Mr. Chairman: I find several of your leaders, like Jefferson and several High Court Judges, saying in the inquiry held in the USA that the patent law is mainly to promote research and industry particularly of the country where the law is passed.

Mr. Robert Meagher: I think, every country is interested in developing its own technology and economy first. When you have development then you export. The problem is only to get started. However, there is a a trend in the world today which is much more international.

Mr. Chirman: Internationalism comes only when nationalism is satisfied.

Mr. Robert Meagher: That is true.

Mr. Chairman: Thank you very much.

Mr. Robert Meagher: May I just say once again that I want to thank you all for enabling me to come here. I consider it to be a great honour and pleasure to be able to come here. I hope, over the years as I keep coming back to India, we will have a chance to meet more often. Thank you very much.

Shri Sham Lal Saraf: May we reciprocate the same feelings.

(The witness then withdrew).

(The Committee then adjourned).

Minutes of evidence given before the Joint Committee on the Patents Bill, 1965.

Friday, the 15th July, 1966 *at* 09.30 *hours.*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Seth Achal Singh.

33. Shri Mulka Govinda Reddy.
34. Shri M. R. Shervani.
35. Dr. M. M. S. Siddhu.
36. Shri Dalpat Singh.
37. Shri R. P. Singh.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*
3. Dr. A. Joga Rao, *Controller General of Patents, Designs and Trade Marks.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

DRAFTSMEN

1. Shri V. N. Bhatia, *Joint Secretary, Legislative Department, Ministry of Law.*
2. Shri R. V. S. Perisastri, *Deputy Draftsman, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Organisation of Pharmaceutical Producers of India, *Bombay.*

Spokesmen:

1. Dr. H. R. Nanji—*President.*
2. Mr. Keith C. Roy—*Vice-President.*
3. Shri A. V. Mody.
4. Mr. J. Reece.
5. Dr. S. L. Mukherjee.
6. Shri S. V. Divecha.
7. Shri J. N. Chaudhry.

II. Indian Chemical Manufacturers' Association, *Bombay.*

Spokesmen:

1. Shri J. H. Doshi, *Member, Executive Committee.*
2. Shri P. D. Nargolwala.
3. Dr. K. Subramanyam, *Secretary.*

I. Organisation of Pharmaceutical Producers of India, Bombay.

Spokesmen:

1. Dr. H. R. Nanji.
2. Shri Keith C. Roy.
3. Shri S. V. Divecha.
4. Shri J. Reece.
5. Shri A. V. Mody.
6. Dr. S. L. Mukherjee.
7. Shri J. N. Chaudhry.

Mr. Chairman: The evidence that you give is public. It will be printed and laid on the Table of the House. It will be circulated to all the Members of Parliament. Even if you want anything to be kept confidential, it will be printed and given to all Members.

We have received your Memorandum. It has been circulated to all the Members. If you want to make out any new point or stress any particular point, you may do so. Afterwards, the Members will ask questions and you may answer them.

Dr. H. R. Nanji: Mr. Chairman and the Members of the Committee: I take it as my very pleasant duty to thank you on behalf of the Organisation of Pharmaceutical Producers of India and my colleagues present with me here for giving us a welcome opportunity of submitting oral evidence before this truly representative Select Committee, which comprises of a select group of Members from Lok Sabha and Rajya Sabha. The manner in which this august Committee has been prepared to take evidence from all individuals and organisations, Indian and foreign, who have some knowledge to shed on the subject of patent system has been most exhilerating and satisfying. We know that this is not usual with the Select Committee. It is a great tribute to your open-mindedness and to the catholicity of the parliamentary system.

My colleagues and I are before you with a reckonable status on behalf of the Indian Pharmaceutical Industry. The Organisation we represent includes as members most of the important pharmaceutical manufacturers in India. In terms of manufacturing capacity, it represents more than 70 per cent and in terms of exports, more than 90 per cent. It embraces public sector as well as private sector companies including purely indigenous manufacturing units.

The Patents Bill contains some clauses which may be said to be discriminatory against the drugs industry and, therefore, is of vital importance to our members. The subject-matter covered in the Bill is so comprehensive and so highly technical that it is difficult for one person only to study all the aspects and be in a position to answer satisfactorily your questions. With your permission, therefore, I have taken the liberty of bringing with me some of my colleagues. I have pleasure to introduce them.

Mr. Keith C. Roy is the Vice-President of this Organisation and the Managing Director of Merck Sharp & Dohme of India Ltd. He joined the Indian Civil Service in 1935 and retired in the year 1952. He has represented India at various international conferences including the Colombo Plan Conference, Paris Peace Conference and meetings of the World Bank.

Mr. S. V. Divecha is the Secretary and the Legal Adviser of Hoechst Pharmaceuticals Ltd. He practised as a Solicitor in Bombay for 9 years and in the last over 6 years has been attending to patents and trade mark matters on behalf of this firm.

Mr. Chaudhry is the Executive Director of the Organisation. He worked with the Government of India from 1947 to 1960 in the Ministries of Communications and External Affairs. He represented India in the war torn Vietnam from 1960 to 1965 based at Hanoi. For sometime he was the Parliamentary Assistant attached with the late Prime Minister, Pandit Jawaharlal Nehru.

Mr. J. Reece is a Director of Glaxo Laboratories India Private Ltd., a Fellow of the Pharmaceutical Society of Great Britain and he has first-hand experience in pricing and sales.

Mr. Mody is the Chairman of the Development Council for Drugs and Pharmaceuticals, Government of India and the Chairman and the Managing Director of the Unichen Laboratories Ltd. He has considerable experience of researches done in National Laboratories.

Dr. S. L. Mukherjee is the Director-in-charge of Research in Sarabhai Chemicals Ltd. and has numerous patents to his credit.

Lastly, I am the President of the Organisation. My primary interest is in quality control being the Managing Director of the firm of Public Analysts and Consulting Chemists Italab Private Ltd. Besides, I am a Technical Director of Pharmed Private Ltd. and Wander Pharmed Private Ltd., both pharmaceutical firms. I have had the opportunity of studying the complete cross-section of the Indian pharmaceutical industry during the last 12 years, first as a member of the Pharmaceutical Enquiry Committee and later as Chairman of the Development Council of Drugs and Pharmaceuticals. Also I was a member of the Pharmaceutical Delegation to Russia in 1956 and Leader of another Pharmaceutical Delegation in 1963 to the United States of America, the United Kingdom, Germany, Switzerland and Japan. Our members were extremely happy to show round the plants to the distinguished members of this Committee in Bombay, Baroda, Poona, Calcutta, etc. It is my firm belief that these visits have been mutually beneficial: from your point of view to know the present status of the pharmaceutical industry and the future programme we have before us; and from our point of view to know the main points which are exercising your minds on the subject under consideration.

Today perhaps we are in a better position to discuss this subject in its proper perspective. With your permission I propose to give a brief expose highlighting some of the essential comments in our memoranda, explaining and elaborating wherever necessary.

An important feature of this expose is that we have suggested precise amendments to some of the vital clauses in the Bill. These amendments have already been circulated to the members. We will then be ready to answer the questions which the members may ask. For the reason I have stated, the question will be answered either by myself or by one of my colleagues who has made a special study in the relevant subject.

We have submitted to the Committee two memoranda: the first deals very briefly with our comments and suggestions on different clauses of the Bill; and the second, the supplementary memorandum, comprises a large mass of facts and data which are relevant to the subject.

Our principal motivation in submitting our views before the Committee are first to share only the true facts and secondly to be guided by what we wish to call the national and enduring interests of this country.

We have every reason to be proud of the record of the pharmaceutical industry in the period which has elapsed after Independence. Unlike many other industries, the pharmaceutical industry has met every Plan target. In the fields of production, import substitution and exports, we have done very well indeed. All this is lucidly brought out in the booklet called Indian Phamaceutical Industry, 1965. This booklet has already been circulated to the members.

Some hon. Members: We have not received it.

Dr. H. R. Nanji: We shall arrange to circulate it.

This booklet has been compiled and published on behalf of the Director

General of Technical Development, Government of India. It is an official publication and whatever is stated therein is based on facts.

For the benefit of the members we have prepared four charts. These charts have also been circulated to the members. The first chart shows the production value in rupees of pharmaceuticals from 1948 to 1965; this chart shows clearly how the production has risen from a mere Rs. 12 crores in 1948 to the expected target of Rs. 175 crores at the end of the Third Plan. The second chart shows the production of basic drugs in India in 1964; this chart shows the value of production of the major items of basic drugs such as antibiotics, sulpha drugs, anti-T.B. drugs, anti-dysentery drugs and so on.

Shri R. P. Sinha: Both private and public sector?

Dr. H. R. Nanji: Yes; both are included.

The third chart shows exports during 1958—65. The fourth chart shows the saving in foreign exchange and this is a measure of import substitution.

Shri Kashi Ram Gupta: I have not been given the charts.

Mr. Chairman: They have been circulated.

Dr. H. R. Nanji: Reference may also be made to Chapter 1 of the Supplementary Memorandum, which outlines also the economic contribution the industry has made to the nation. We wish to submit that the phenomenal growth of the pharmaceutical industry in this country has been largely due to the patent system which has been in vogue so far. This system for developed and developing countries has come to occupy a unique importance to both. In other words, it has to be recognised that the law relating to patents has to be reviewed in the international context in relation to capital investment, know-how and advancements made in research. . .

Shri R. Ramanathan Chettiar: Without sacrificing the national interest.

Dr. H. R. Nanji: It can never be approached or dealt with in isolation.

In the second Chapter of the Supplementary Memorandum, the role of patents in the transfer of technology to India has been dealt with exhaustively. We have illustrated what phenomenal progress the pharmaceutical industry has made in the last decade owing to adequate patent protection and have highlighted the adverse effects which must follow the weakening of patent protection not only on the transfer of technology from abroad but also on investment, research and export. No doubt, it is the sovereign right of every government to devise legislation most suited to that country or in the best form of enlightened self-interest. In fact, the kingpin of our argument is that we should stand guided by enlightened self-interest. Our Prime Minister said recently that nations have become increasingly inter-dependent in the modern age and our efforts should be to work together. The time has long past when we could afford to live as frogs in the well. The highest calling of the scientist is the development of knowledge in the service of mankind.

We are convinced that fruits of advancement in the pharmaceutical field, wherever made, should be available and acceptable to all people and our people are no exception. It is very relevant to examine the progress made by a number of countries under the patent system. The first country which we, as Asians, would like to consider is Japan. Before I state some facts about that country, I wish to correct a totally incorrect statement that has been recently made, namely, that Japan has progressed as they had no patent regulation prior to the War. That country has had

Patent Law going as back as 1885, became a Member of the Paris Union in 1889 and the present strong Patent Law had its origin in 1921. The latest amendments in 1959 only serve to make the patent protection even stronger. A country completely impoverished in defeat, industrially ruined and politically shaken has risen in economic heights never known before. In the pharmaceutical industry, it is to-day second only to the U.S.A. with a production figure of Rs. 550 crores in 1964 for a population of 90 millions as compared with about Rs. 140 crores in 1965 in India for a population of 450 millions. In standards, it compares with the most advanced countries of the world and its products are imported by the U.S., Germany, France, U.K. and many Far Eastern countries. Out of the total pharmaceutical exports of Rs. 23.71 crores in 1964, the value of exports to the U.S. alone was Rs. 3.6 crores more than our total exports in pharmaceuticals. Its research expenditure on pharmaceuticals only in the year 1964 was Rs. 17.9 crores.

We are very sensitive in regard to royalty payments for technical know-how. In the year 1964, Japan made the royalty payments to the tune of Rs. 69 crores. She earned only Rs. 3.5 crores as patent royalty which means that the net minimum payments amounted to Rs. 65.5 crores. I make bold to say without any fear of contradiction that this remarkable achievement of Japan is due to three factors:

(1) Strong patent legislation safeguarding the essential interests of the inventor;

(2) Very free acceptance of foreign know-how from almost every advanced country in the world; and

(3) Payment of adequate royalties to the patentees.

You have heard the evidence of the Japanese Delegation. They are convinced that the cross-flow of technical know-how and cross fertilisation of know-how in international commerce is possible only under a complete protection of Patent Law. We have given in Chapter 8 (in our supplementary memorandum) a more detailed study on Japan. The evidence tendered by the distinguished Japanese Delegations must have given a very clear picture of this spectacular progress in pharmaceuticals in Japan and how this has been achieved. This classic example is well worthy a close study and emulation by our country.

Germany's example is not different from Japan in terms of the impoverished state it found itself in after World War II.

The example of Italy has been frequently misquoted in recent years. It has been stated that Italy has a flourishing pharmaceutical industry because there has been no Patent protection for drugs in the last two decades. It has also been stated that for the same reason the prices of drugs in Italy are the least. Both these statements are probably wrong. For the benefit of Members, we have included a Chapter on the Italian Pharmaceutical Industry in our Supplementary Memorandum Chapter 7.

In this regard, Members have had the benefit of the oral evidence of a very eminent Italian, Professor Bergami. I am certain he must have cleared many of the misconceptions alleged to be associated with the existence of a non-patent system in Italy in the field of pharmaceuticals.

Europe, Japan and America belong to one school of thought on the patent system. There is however a delightful identity in this field between this group and East Europe. The United Soviet Republic, Czechoslovakia, Yugoslavia and other East European countries all adhere to a strong patent system and are members of the Paris Union. The essential requisites for becoming a member of the Paris Union is to have a national patent legislation which gives adequate pro-

tection to the inventor and does not erode his rights. It is not so long ago that Russia has joined the community of nations for the exchange of information and know-how in science and technology and as a result, it has taken up membership of the oldest international institution on patents, the Paris Union.

Shri Peter Alvares: May I ask one question? It would be better if he goes to other aspects instead of reading the whole thing.

Shri Sham Lal Saraf: Let him have his full say.

Mr. Chairman: You can continue.

Dr. H. R. Nanji: The significance of this development is only too obvious. It certainly means that on at least one subject of international importance, East and West meet on one platform and conform to certain identical standards which should form a basis for ourselves. In the sixth Chapter of our supplementary memorandum, we have given a resume of the Patent Laws in some of the important countries in the world covering essential aspects only of such laws in respect of period of validity of patent, patantable subject matters, compulsory licences and licences of right, Government use of patents and expropriation. In the 9th Chapter, the factual data on a number of important subjects relevant to the Bill have been given. Some of these have been compiled for the first time in India and shall replace the erroneous conjectures and statements made from time to time. Other explanations apart, this organisation and the delegation appearing on its behalf have. for very good reasons, drawn heavily on the report of Justice Rajagopala Iyengar. You will agree that he took three years in completing this report. He is highly respected and an eminent judge of the Supreme Court and made a thorough, intelligent and detailed study of the subject. He deserves by and large acceptance and respect from all of us. Since the time he submitted his report and now, the economic developments in the world, more so in our country, point to one conclusion only that the Patent system is the greatest instrument to stimulate industrial research, and through it ever-growing industrial progress and growth. Countries are the warp threads and international economic co-operation in science and technology are the weft threads of the fabric of peace. The more the wefts the stronger the peace.

Sooner than later India has to join the Paris Union so as to belong to the progressive group of countries on whose support and co-operation this Union thrives. A Model Law for developing countries on inventions has been drafted by a Committee of Experts under the auspices of the United International Bureau for the Protection of Intellectual Property. This is known as BIRPI. It was composed of 22 countries including India out of a total of 69 countries which consider themselves as developing countries. In formulating our views we have drawn on this report, again for good reasons. Conformity with the recommendations of this report will make it easier for us to gain membership of the Paris Union.

Shri R. Ramanathan Chettiar: May I draw the attention of the witness to Justice Rajagopala Ayyangar's report on patent legislation where it is mentioned that USA virtually confiscated all German patents during the Second World War.

Dr. H. R. Nanji: Before I venture to explain this Organiation's views on the important clauses of the Bill, I wish to state that we only desire to contribute our views in the hope that the Bill as finally drafted will be wholesome, practical and helpful to the growth of the pharmaceutical industry of India which is so vital for the good health of the nation.

I will now come to the consideration of a few of the important clauses to which reference has been made in our memorandum.

First is Cl. 2(h)—page 12 of the memorandum. Let me first draw the attention of the Committee to our comments on the definition of 'Government Undertaking'. Under clauses 99 and 100 I wish to discuss why 'public sector undertaking' and 'any other undertaking' should not be included in the definition of 'Government Undertaking'. To the best of our knowledge no country in the world includes Universities, research institutions or other scientific or technical institutions in such a definition for the simple reason that this is tantamount to withdrawal of the effective value of patent protection over a wide field. Mr. Justice Ayyangar also expresses the very same view. We do accept that Universities and research and other institutions need the use of patented invention for the purposes merely of experimenting or doing research including the imparting of instructions to pupils. These needs have been provided for adequately in Cl. 48(d) of the Bill. The amendment we have suggested has been placed on the Table and in respect of this clause 2(h) we have recommended that sub-clause (ii) and sub-clause (iii) be deleted together with the following words from clause 2(h) 'Council of Scientific and Industrial Research..... major part of the Government.'

Now, on clause (5) the Minister for Industry in introducing the Bill in the Lok Sabha has made some forceful remarks regarding process/product patents. I, therefore, wish to take a little of your time to explain the stand taken by this Organiation OPPI.

For the first time the Indian patent law makes a distinction between different clauses of inventions in regard to the type of protection and this clause restricts the claim to the processes only in the case of foods, drugs and substances prepared by chemical processes. There is not the least doubt that there is an increasing trend in the world both in developing and developed countries to grant product protection *per se* in respect of inventions for drugs and medicines. The reasons are obvious. A very large majority of inventions in the field of drugs and medicines are produced by synthesis and the process of manufacture generally does not involve any novel principle. Nor does it constitute a significant part of the research work leading to the discovery of a new medicine. It is the far more exhaustive testing itself—bacteriological, pharmacological and clinical—of thousands of compounds out of which one may finally emerge as the useful drug that represents the justification for patent protection. With little research effort one can work out in many cases an alternative process and thereby circumvent the process patent of the original inventor. It works, therefore, unfairly to the disadvantage of the first inventor. However, there are some scientists and technologists who held the view that in the present stage of development of science and technology in this country product protection may run counter to the interests of indigenous research and technology. Therefore, we suggest that, for the present, in that field of articles of food, medicines and drugs the protection be extended to the process of manufacture and to the products produced by such process.

However, the main difficulty in accepting process patents is the necessity for the patentee to provide burden of proof in case of alleged infringement. This is difficult and weli nigh impossible especially when the drug or medicine is imported from abroad to prove that the infringer has used the process claimed in the patent specification. It is usually necessary to gain access to his plant which neither the patentee nor probably the Court can enforce. This difficulty has been clearly recognised in the BIRPI report. To overcome this difficulty the BIRPI report has made a provision under Sec. 51 that in respect of process patent the product is presumed to be made by the patented process unless proved to the contrary. That is, the burden of proof

should lie on the alleged infringer. All industrialised countries having only process protection, for example, Japan, Germany Switzerland, etc. and even the East European countries such as Poland and Yugoslavia have provision to this effect in their respective patent laws.

This organization very strongly urges that the Indian patent law should also contain a similar provision to protect the inventor. The exact wording of the clause is given in the suggested amendment.

Clause 47: In some knowledgeable circles a view has been expressed that the process protection granted under clauses 5 and 47 of the Bill may not be effective to cover the importation of the product made by the particular process patented in India. According to a UK decision where the patent is not for an article but is only for a process, the protection covers not merely the patented process but also extends to the articles when made by the use of the process whether such use is within the country or abroad so that importation or sale of an article made abroad by the patented process would be an infringement of the process patent. Justice Ayyangar in his report on the revision of patent law has recommended the adoption of the Rule followed by U.K.

The Bill does not specifically state that importation into India of a product made abroad by a process patented in India will amount to an infringement of the patent. It is submitted that in order to set at rest any future controversy, Section 47 should be suitably amended to secure that the importation of a product made abroad by a process patented in India will be deemed to be an infringement of the patent.

Coming to clause 48, this is from our point of view, a very important clause. This clause takes out from the sphere of infringement of patent rights a wide variety of operations if they are done by or on behalf of the Government. It permits the Government to use a patented invention or to import a product covered by a patent without any compensation to the patentee. The exercise of Government's rights under this clause is not subject to judicial assessment by an independent tribunal. Let us briefly examine the detailed implications. Firstly, if this clause were enacted, the provisions are cast in such wide terms as to confer on the Government which is a major consumer of many products, almost unlimited powers to infringe patent rights.

Secondly, this clause goes counter to the very basic idea and philosophy for the grant of patents given in clause 83 which states that patents are granted to encourage inventions and to secure that they are worked in India on a commercial scale and to the fullest extent. It does not need much imagination to see that if clause 48 were enacted it would encourage the import of pirated goods under circumstances of grossly injurious and unfair competition to the home industry. Moreover, it would subject indigenous industry to loss of patent protection over a wide field.

Thirdly, the constitutional propriety of a clause which permits the Government the use of patents which are a species of intangible property, without payment of reasonable compensation and without due process of law, needs careful examination. We concede that it is the duty of Government to ensure that the laws of the country pay due regard to the national economy. The rights of Government to import a patented product or to make use of patented invention are amply provided for in clauses 99, 100 and 102. Under these clauses, Government has the right to import a patented article and use a patented invention. But the fundamental difference between these clauses and clause 48 is that the exercise of Government's

rights is subject to payment of compensation and in default of an agreement, compensation has to be determined by a reference to the High Court under clause 103.

I shall have something more to say on these two clauses a little later. The relative provisions of this clause 48 do not find a parallel in the patent laws of any country in the world. We strongly urge the deletion of clause 48, particularly as there are adequate provisions in the Bill for use of an invention by the Government for certain specified purposes.

We then come to clause 53. Here again for the first time in India, this clause discriminates in the term of a patent in respect of inventions of drugs and medicines. Not only has the period of validity been reduced to 10 years for new patents, but the term of all existing patents relating to drugs and medicines has also been reduced to 10 years. Lastly, the provision for extension of a patent in the existing patent law has not been included in the Bill. In the memorandum we have made detailed comments on this clause. We have reviewed the position in other countries of the world and have laid stress on the likely adverse eflects if this clause is enacted in its present form.

Apart from anything else, this Committee must consider what damage this clause will inflict upon Indian patentees. Our own scientists are beginning to produce results, some of which are patentable. If we are to put limitations on the period of validity our own scientists will suffer. Sir, it has to be emphasised that the time-lag between the date of application for a patent and the manufacture of a patented article in India is extremely long for items covered by the drug industry due to a number of additional steps which are necessary under the Drugs Act and under the Industries Development and Regulations Act. It is not impossible that in many cases a patent will be almost due for expiry before completing the procedures that are necessary before commercial manufacture of a new drug is possible. Therfore, if the time is reduced to 10 years, it would in effect, in some cases be as good as abrogation of patents in the field of drugs and medicines. There is hardly any country in the world which provides for a term of 10 years in respect of patents for drugs and medicines without making adequate provision for the extension of the term. We recommend that the provision in the existing Act for exetension of the term of the patent when Government are satisfied that the patent has not been sufficiently remunerative, be retained in the Bill.

As regards patents granted under the existing Act, there can be no doubt that by reducing the term to 10 years, a patentee is deprived of his rights in the patent vested in him by the old Act. This deprivation would surely raise legal issues and needs careful examination.

In the amendment to this clause which we have proposed, we have recommended 14 years from the date of the patent. But if this is unacceptable, we have suggested as an alternative—but only as a rather poor alternative—a term of 10 years from the date of sealing of the patent.

Next clauses 87 and 88. These two clauses are among the most important in the Bill and a correct reappraisal by the Joint Committee of the deep issues involved will go a long way towards sustaining the healthy development of the drugs and chemicals industries and ensure a proper climate for research and investment in India. Clause 88 compels the Controller to grant a licence without taking into consideration the basic minimum redustries and ensure a proper climate plicant for a compulsory licence under clause 84 as specified in clause 85. The order of the Controller fixing the terms on which the licence shall be

granted is not governed by the provisions of clause 92 pertaining to the procedure for dealing with applications for compulsory licences. The applications made under clause 88 can be summarily disposed of by the Controller. No appeal has been provided for. It has been our firm belief that the automatic endorsement of patents relating to drugs with the word "licence of right" and the resulting automatic grant of licence by the Controller to any applicant, will result in chaos and will have profound effects in a number of directions which have been narrated in the memorandum on pages 52 and 53. There is not the least doubt that these provisions will hamper industrial progress and restrict research and inventive innovation in the country in the field of drugs and chemicals. The ceiling of 4 per cent royalty and other remuneration in the field of drugs and medicines is another discriminatory provision and will impede the smooth flow of know-how. There is also no substance in the argument that the costs of drugs are high, because royalty payments are exorbitant. All royalty payments are strictly regulated by the Government and their incidence on the cost of drugs has been shown to be negligible. Justice Ayyangar in his Report after having considered the patent systems of various countries came to the conclusion that it is not feasible to arrive at a uniform rate of royalty which would be reasonable for licences in respect of each and every invention and he recommended that it is not desirable to fix statutorily the maximum rate of allowable royalty. The Model Law for developing countries prepared by BIRPI stipulates that a compulsory licence shall only be granted subject to the payment of adequate royalties commensurate with the extent to which the invention is worked. In Italy, the Patent Law which will shortly be introduced lays down that the payment of royalty shall be fair in relation to the importance of the invention, its expected economic return, the duration of the licence and every other factor relevant to its use.

We fully subscribe to the stipulations in that Patent Law. The industry is aware of the reasons why applications for compulsory licences under section 23(CC) of the existing Act are very few in number and that such applications have been finally adjudicated upon only after considerable delay, expense and inconvenience both to the applicant as well as the patentee. We desire to make some concrete and specific recommendations to improve the present compulsory licensing procedure and we do respectfully submit that this clause 87(I) in regard to 'Licence of Right' is totally unnecessary, as all our legitimate objects will be positively met without difficulty if our suggestions are accepted. Automatic licensing will bring about a situtation similar to that in Itlay which the Italian Government are now trying to put right. Our specific recommendations are—We concede that Government should designate certain vital areas such as drugs and medicine in which compulsory licence could be made available at any time *i.e.*, even before the waiting period of 3 years. We do not, however, agree that compulsory licences should be granted for inventions relating to drugs and medicines by the Controller automatically, Licence of Right without taking into consideration the basic minimum requirements to be fulfilled under clause 84 as specified in clause 35.

There should be no ceiling on royalty and we recommend to the Committee adoption of the principle in the Italian draft Patent Law, namely. that royatly should be fair in relation to the importance of the invention, its expected economic return, the duration of the licence and every other factor relevant to its use.

We recommend that the Controller should be directed to decide applications for compulsory licence in the field of drugs or medicines as well as in other fields within a specified time of 3

months and that the application of clause 84 should be modified to this extent. We also recommend that the Controller may permit the applicant to work the invention pending a final decision on the terms if he is satisfied that the conditions specified in clause 85 have been adequately met. And finally, we recommend that an appeal against the decision of the Controller as to the grant of a compulsory licence and the terms of such licence including the payment of royalty should lie to a judicial tribunal which should in its turn decide the appeal within a specified time, say, of three months. The amendments incorporating these recommendations are before you.

Clause 95: Sub-clause (3) of clause 95 of the Bill empowers the Government to authorise any licence to import the patented article from abroad on terms and conditions which are not specifically laid down. This clause does not provide for payment of any royalty or compensation to the patentee. No appeal has been provided for against any action taken under this sub-clause. We submit that provisions of this sub-clause (3) are contrary to the general principles applicable to the working of patented inventions as set out in clauses 83, 94 and 95(2) of the Bill. The Patent system in general and the compulsory licensing provisions in particular aim at promoting the working of the patented process within the country and importation will certainly be not in conformity with this aim of encouraging indigenous industry. We respectfully submit that clause 95(3) is illogical in the context of clauses 84 and 85 in that having granted a compulsory licence for the purpose of working the invention in India, clause 95(3) suddenly permit the Government to do the very opposite namely to import. This clause puts in reverse the object of clause 84, namely, encourage the production of the invention in India. Moreover, Government had adequate powers to import a patented product for the purpose of the Government, under Chapter VII of the Bill. Therefore, sub-clause (3) of clause 95 is entirely unnecessary and should be deleted.

Clauses 99, 100 *and* 102: Chapter XVII deals with the use of inventions for the purposes of Government and acquisition of invention by the Central Government. These clause empower the Government by mere notification to authorise not only Government Departments but also Government undertakings and any other undertaking in the private sector to make use of the patented invention for the purpose of Government having regard to the interests of the general public. The use has to be on agreed terms or as determined by the High Court, in default of agreement. Secondly, it permits Government to acquire the invention outright for Government use. These clauses place no limitation whatsoever on the industries that may be included or in the specific circumstances under which the powers can be exercised and give the Government indefinite general power to give firms patent rights to which they have otherwise no entitlement. These clauses, therefore, lead to a serious erosion of patent rights.

We do concede the right of the Government in certain specific circumstances to use an invention for the purpose of the Government. But such use should only be for the purpose of the Central Government or a State Government or a Government undertaking as defined in this memorandum. There is no justification to extend such use to a Corporation, public sector undertaking, established by a Central or State Act because these public sector undertakings are indeed commercial concerns and it is only appropriate that they should apply for compulsory licences just as any private sector undertaking is required to do. There is no justification or there is even less justification to extend use of inventions to any other undertaking in which the Government has no interest at all.

Secondly, it is imperative that the vital areas in which the use of an invention for the purposes of Government may be permitted should be clearly defined. We have accordingly recommended that such use by Government should be restricted to certain specific purposes such as to meet the needs of national defence, national economy or public health (epidemics).

Thirdly, it is our submission that the powers of the Central Government under clause 100 should not be exercised before granting the patentee an opportunity of being heard.

Finally, clause 102 pertaining to the acquisition of an invention by the Central Government should be deleted as there are no legitimate reasons for such a complete appropriation of industrial property rights. In any case, the acquisition of an invention must be restricted to certain specific public purposes, such as the defence, the emergency or an epidemic. The suggested amendments giving effect to the above submissions are before you.

Clause 116.—This clause deals with appeals. We submit that the denial of a judicial review from the orders of the Controller or the Central Government is an unwarranted departure from basic principles. Industrial property rights are the same as any property and if they are to be expropriated, a citizen must have the right of adjudication on his compensation by a completely independent tribunal not subject to administrative control. If the Indian Constitution is to preserve democracy, there can be no appeal from *Caesar* to *Caesar*. In the memorandum we have reviewed the position in some other countries and have made a pointed reference to Justice Ayyangar's comments and the recommendations in the Model Patent Law prepared by BIRPI. This organisation has made the following concrete recommendations regarding appeals keeping fully in mind the necessity of obviating delays.

(1) An appeal against the decision of the Controller as to the grant of compulsory licence should lie to the Appeal Tribunal.

(2) Where no appeal is provided against the decision of the Controller or Government or where an appeal is provided to the Central Government, the orders or directions of the Controller or Central Government, as the case may be, should be appellable to a statutory judicial tribunal constituted on the lines of the Income-tax Tribunal or the Sales Tax Tribunal. In short, we ask for a tribunal not subject to administrative control.

We have suggested the amendments which are necessary in clause 116 and they are before you.

Clause 158.—The High Court and Appeal Tribunal may make rules consistent with this Act as to the conduct and procedure in respect of proceedings before them under this Act. My colleague, Mr. Divecha, will be pleased to answer any question on this clause or indeed on the legal aspects of any other clause.

I have dealt today only with clauses which we consider of very great importance. There are a number of other clauses, for instance, clauses 2(g), 2(b), 3(d), 25, 64, 89, 96, 102, 103, 112 and 162 on which this Organisation have made some submissions, but I do not wish to repeat them.

I have taken some time in presenting our views on various clauses of the Bill. We have tried to justice to the principles underlying the patent system. There are two or three certain other general aspects on which some explanation is due. I wish to say a few words on prices, investment, profitability, dividend and research.

We know that the question of drug prices is agitating the members of this Committee. Also some associations and companies, institutions and individuals have drawn attention to this question. Before I proceed to deal with some salient facts about

drug prices me make one pertinent observation regarding those who have expressed views, and at times vehement views, against patents.

One knows that there is one factor which is common to all these. Every one of them have had against them proceedings for infringement of patent. Some of these proceedings still await the decision of the Court. Therefore, the opposition to patent is due, if I may suggest, more to their self-interest. I make this statement with the full knowledge of the facts.

It is pertinent to point out, as shown in the chart of wholesale price index, which was circulated yesterday, that while prices of all commodities have been going up considerably for the last many years, drugs and medicines are among the few items where prices have either declined or held successfully at steady level. In the supplementary memorandum, we have dealt with the question of drug prices in considerable detail, particularly in relation to patents and have drawn pointed attention to some of the glaring fallacies. I should like to touch briefly upon some of the conclusions in this Chapter and make a few pertinent observations.

First, we have shown conclusively that patents as such are only one of the contributory factors to the price of drugs. There are many other much more significant factors which contribute to the price of drugs. We have given an effective answer to the oft-repeated allegation that "patents result in high prices" by (a) comparing the indigenous price and the *c.i.f.* cost of 15 essential non-patented drugs, and (b) by comparing prices of several important drugs in Italy (where there is no patent protection for drugs) with those in other countries such as Britain, Germany, U.S.A., Japan, etc.

The price of a manufactured item is dependent upon the cost of raw materials and the cost of production. There are innumerable factors which have relevance, and over which the industry has no control. If devaluation has proved anything, it is this that the cost of production in this country, because of various factors, is far higher than in other developed countries.

It has been persistently stated by persons who have no knowledge of the position that the cost of the basic ingredients which contain the therapeutic value in a tablet or a capsule or an ampaule is an anfinitesimally small portion of the price charged to the consumer. Such comparisons are completely fallacious. It is like comparing the cost of the raw cotton that goes into a man's shirt, or the value of the wheat, flour and sugar that goes into a packet of biscuits, or the value of the raw tobacco which goes into a pack of 10 cigarettes. The weakness and bias of such arithmetic is obvious. Moreover this difference in the price of the ingredients and of finished product to the consumer is by no means restricted to patented drugs. Take the example of Penicillin vials produced by Hindustan Antibiotics. The cost of ingredients of a vial is 4 P. and the price to the consumer is 42 paise.

Secondly, we have shown clearly that the oft-repeated quotation from the Kefauver Report that "drug prices in India are uniformly higher than in other countries" is not true. To prove this, we have collected the domestic prices to the Public in West Germany, United States, Italy, U.K., Japan and India and for those drugs specifically referred to in the Kefauver report. This table has been placed on the Table this morning. I should like to apologize for the delay in submitting this table.

Shri K. V. Venkatachalam: It has not been circulated.

Dr. H. R. Nanji: We gave it this morning.

Shri R. P. Sinha: We want to have copies of charts distributed this morning.

Dr. H. R. Nanji: Charts were circulated yesterday. This Table which has been circulated shows two things quite clearly. The first is that the prices of drugs in India are not uniformly high as alleged in the Kefauver Report, and secondly, the price of drugs in Italy is not uniformly low because of lack of patent protection. Take for example, Tetracycline Caps. 16 x 250 mg. Price in Germany for Aureomycine is Rs. 30.76, for Terramycin 25.11; in the United States it is Rs. 20.70 and Rs. 23.36; in India it is Rs. 17.71 and Rs. 17.44. Similarly, take Chloramphenicol Price in Germany is Rs. 30.34; in the United States it is Rs. 18.43 for 100 mg., not for 250 mg; in Italy Rs. 9.98; in U.K. Rs. 12.44; in India Rs. 12.00. Take Librium. Price in Germany is Rs. 5,41, in U.S.A. Rs. 22.39; in Italy Rs. 4.76, in U.K. Rs. 6.03, in Japan Rs. 4.46 and in India Rs. 4.40. And like this we go on to the various other items which include Prednisolone, Procaine Penicillin inj., Penicillin Sodium inj., PAS Tabs, etc. etc.

It is to be noted that these are predevaluation comparisons. One immediate effect of devaluation is to alter all the price relationships given in the Memoranda and during this oral evidence. Calculated at devalued rates prices of drugs in India become the lowest in the world.

It has clearly been shown that the domestic prices of different drugs in different countries vary considerably. It is imperative to note, as stated in the Supplementary Memorandum, that the domestic prices of pharmaceuticals in different countries cannot be properly compared without a detailed interpretation of many factors such as duties and levies, taxes, cost of raw-materials and labour, commissions and discounts to wholesalers; the transfer of knowhow; the licensing position, participation in the cost of the basic drug research, etc. In this context of this Bill it is that any attempt to relate prices in one country with those in another is not by itself meaningful. All the comparisons made during the predevaluation period are now proved to be based on artificially high value of the rupee. Particularly, we have drawn attention to the basic fallacy of using as a basis the so-called international prices of drugs for comparison with Indian prices. There are, in fact, no such international prices. Generally, prices which have been quoted by countries like Italy and certain other East European countries are referred to as international prices. There is no doubt that such prices are generally dumping prices and these can readily be proved by examining the domestic prices of the same drugs in these countries. Members are, no doubt, aware that many countries including India for a variety of reasons export several commodities at dumping prices.

Broadly, we have dealt at some length on the usual practice of critics selecting one or two drugs that a particular company manufactured in India and seeking to make price comparison with so-called international prices which are claimed to be very much lower. Reference is frequently made to Taracyclin, chloram Phenicol, librium, vitamin B^{12}, vitamin B^{6}, tolbutamide, etc. We have submitted cogent arguments in the Supplementary Memorandum why such comparisons are erroneous and conclusions drawn from them invalid. It is also fallacious to pick out one or two drugs of a company for examination of prices. A well meaning critic should examine the total profitability of a company. If this is done a very different picture emerges.

Finally, we submit that the questions of prices and profits have to be examined independently. Specific suggestions have been made in regard to the steps that might be considered should Government come to the conclusion that the prices of some drugs in India require examination. The Government of India have adequate powers under existing legislation to control the prices of any commodity including drugs and pharmaceuticals.

All that we ask is that instead of indiscriminate condemnation of the industry as a whole proper steps should be taken to get the cost structure investigated by a statutory body such as the Tariff Commission if Government considers it necessary. Government can rest assured that this Organisation will cooperate fully in this matter.

Some people have the feeling that profitability in the pharmaceutical industry in this country is very high indeed or more than reasonable. I hope I can speak on the ground that hon. Members here do not abhor profitability as such. However, the Prime Minister said the other day in her address to the senior executives from the Public Sector Undertakings that unless the Rs. 2000 crores investment in the public sector brings to the Government offers reasonable profits the whole base of creating this sector would be considered futile. The concensus of opinion at this meeting in respect of profit was that it should be accepted as a test of efficiency and this is distinct from profiteering. More important than this the meeting seemed to accept the principle of a 20 per cent profit return on equity *plus* reserves. The whole sense of the Conference was that our industrial units should pass the tests of profitability, service and growth. My colleague, Mr. Reece, will be pleased to answer any questions on prices.

In the third chapter of the Supplementary Memorandum a resume has been given on investment, turn-over, profitability, dividends, etc. in the pharmaceutical industry in India. Some statements have appeared in the Researve Bank bulletin on investment, profitability, etc. and we have drawn pointed attention to one basic fallacy in these statements on the definition of capital employed. We have discussed this matter with a very senior officer of the Reserve Bank and he agreed that capital employed must include all moneys used in a business including reserves and even including long-term loans and not the paid-up capital only. A different picture of the pharmaceutical industry in respect of profits, dividends, royalty, etc. emerges if the correct figures of the capital employed are taken. I should like to draw the attention of the Members of the Committee to the figures of dividends as percentage of net worth published in the Reserve Bank bulletin for November 1965 for several industries. These figures show clearly that dividends in the pharmaceutical industry are certainly not high. May I also draw the attention of your Committee to the findings of an independent survey of the pharmaceutical industry conducted by a firm of reputed Chartered Accountants on behalf of OPPI. Full details of this survey which is considered statistically significant are given in chapter 3 of the Supplementary Memorandum. I wish just to refer in brief to some of the important points. The net profit after provision for taxation and development rebate reserves available is 8.3 per cent of turnover; the total overseas payments in the form of dividends, royalties and technical fee represented only 3·1 per cent of turnover. By any standard these are modest returns compared with other group of industries. The pharmaceutical industry's financial position viewed from all angles cannot be termed as making huge profits. My colleague Mr. Roy, who has considerable experience of finance, will answer any questions on the subject of profitability, dividends, etc.

Research is the lifeline of the pharmaceutical industry and the base of growth of industry in each country has been in direct proportion to the amount of effort and money expended in fundamental and applied research. In the Fifth Chapter of the Supplementary Memorandum we have reviewed the question of research for the pharmaceutical industry. We have stated candidly what has been done in India; what remains to be done and what are the problems and difficulties. The statement that no research or

very little research, if at all, is being carried out by the pharmaceutical industry in India is not correct. Almost all enlightened pharmaceutical companies in India have up-to-date product development and quality control laboratories. Basic research has also been carried by several old established firms, such as, Alembic, Sarabhai, Bengal chemicals, etc. as well as by Hindustan Antibiotics. Nevertheless, it is to be admitted that the country's output in terms of basic research has still a long way to go. There are three fundamental reasons for this situation; first, basic drug research is extremely costly in terms of capital investment and recurring expenditure. America's research budget is approximately Rs. 175 crores per annum which is higher than our total production of pharmaceuticals in India. For each new drug discovered in the last decade, the industry has spent something of the order of Rs. 2½ crores in research and development. Basic research much sustain 3,000 or more failures to one successful new drug. Such massive outlay in research is only possible when our industry has grown sufficiently. Secondly, basic research must be undertaken as a coordinated effort in diverse fields of scientific endeavour by a team of experts.

Mr. Chairman: You need not repeat what you have said in your memorandum. You must leave some time for our Members to put questions.

Dr. H. R. Nanji: If complete information is made available to hon. Members about the two new drugs discovered by Hindustan Antibiotics, it will support our contention regarding the time it takes between discovery of a drug and its commercial manufacture. Hamycin was discovered in 1960 and after six years they have been able to commercially manufacture only a few kilos of this drug in spite of the favoured treatment given to public sector undertakings. The rate of royalty fixed by the Government of India, it is understood, is 5 per cent minimum for this drug, while for the other, Dermostatin, it is 7½ per cent. According to press reports quoting the Minister of Petroleum and Chemicals Government will earn a royalty of Rs. 30 lakhs. The cost of of the new drug is Rs. 20,000 per kg. which is very high indeed, but this high cost phenomenon is generally applicable to all new discoveries. This company is seeking patent protection in foreign countries for a maximum period. What is sauce for the goose is sauce for the gander.

Patents are by no means symbols of foreign domination in either a political or economic sense. They make no inroads into our intellectual or scientific progress. It is an international institution to which all progressive-minded individuals and nations have voluntarily given acceptance. We cannot afford to ignore world experience, universal concensus, the UN recommendations and most of all, the recommendations of a very eminent Supreme Court Judge who made an impartial study of the subject over a period of years. If we pursue a dogmatic policy with obstinacy, it will kill the goose which has laid many golden eggs and promises to lay many more. We cannot put the clock back in the field of international co-operation. While inaugurating the new ordnance factory early this month, our Prime Minister said:

> "Technology is progressing so fast that there is no sense in trying to duplicate all the effort when we can exercise the power of choosing the best results obtained elsewhere."

This is the logic of technological co-operation. The system of patents plays a major role in the intellectual field that is without paralled. Never before has man unlocked so many secrets of nature and applied them for the benefit of mankind. The stimulus of the patent system must be permitted to produce products and processes that will create jobs,

improve the health and well being of our country men and contribute to the social and economic aims of our country.

My colleagues and I have been extremely painstaking in preparing the presentation which I have placed before you. Your conclusions will be taken as almost the concensus of public opinion on the vital legislative measure before you. To that extent your responsibility is greater. My colleagues and I appeal that you may consider our views dispassionately and impartially and strictly on the merits of the subject.

Shri Bibhudhendra Misra: What according to you, is the total investment in the pharmaceutical industry?

Shri S. V. Divecha: Rs. 56 crores in 1962. It is estimated to be Rs. 150 crores by the end of the Third Plan, and the Fourth Plan figure is expected to increase to Rs. 190 crores. This amount represents only equity capital and not working capital, ploughed back profits etc.

Shri Kashi Ram Gupta: What is the total membership of your organisation, and out of it how many are Indian-owned firms with Indian capital, and how many have foreign collaboration and how many are totally foreign-owned?

Dr. H. R. Nanji: I have not got the exact breakdown, but I would say that our membership is 69, which includes most of the important companies having foreign collaboration, firms like Alembic, Unichem etc., which have no foreign collaboration, and two public sector undertakings.

Shri Kashi Ram Gupta: Can you give these figures later on?

Dr. H. R. Nanji: Yes.

Shri Kashi Ram Gupta: Also the figures about the total capital investment in those companies owned by Indians and in those owned by collaborators or foreign firms, excluding the public sector.

Dr. H. R. Nanji: Certainly we shall provide.

Shri Kashi Ram Gupta: On page 14 of your second memorandum you have given the percentage on the basis of the turnover, but it is not a percentage on the basis of profit on capital investment. What is the reason for giving this on the basis of turnover instead of on capital investment?

Shri Keith C. Roy: As my colleague has said, we have made very serious attempts to try and place the financial position of the pharmaceutical industry in its proper context, and I would, with your permission, like to refer, in order to try and answer the question which the hon. Member has put, to the two articles in the Reserve Bank Bulletins of November, 1964 and November, 1965 which I hope will give some indication of the exact figures and the financial status of the pharmaceutical industry when measured by accepted financial standards.

Shri Kashi Ram Gupta: My point was quite different. My point is, what is the reason that the percentage of your total payments is based on the turnover, because that figure based on turnover is not scientific? Let alone the Reserve Bank Bulletin; why this percentage is arrived at in this way? That is the question.

Shri Keith C. Roy: It is because of the confusion, if I may say so with respect, created by the different concepts taken in the Reserve Bank bulletins of the three criteria which can be established for measuring the financial status of any company, that is to say, the equity capital; the net worth and the total capital employed. We have not yet, unfortunately, been able, within our organisation,

and in consultation with the Reserve Bank, to establish universally accepted criteria for these particular purposes.

Shri Kashi Ram Gupta: You have given the figures of dividend and royalty together. Is it possible to give the figures separately, showing the amount of dividends and the amount of royalty separately?

Shri Keith C. Roy: I have got the figures separately and I will make them available to you before I leave Delhi.

Shri Kashi Ram Gupta: These royalties are due to compulsory licences?

Shri Keith C. Roy: No, Sir.

Shri Kashi Ram Gupta: What is the basis of these royalties?

Shri Keith C. Roy: The Reserve Bank Bulletin of 1964 has taken the figures on the basis of the Royalty and Technical Service Remittances.

Mr. Chairman: Is it by agreement?

Shri Keith C. Roy: The 1964 Reserve Bank bulletin's figures are the results of a sample survey made of technical assistance and knowhow agreements sanctioned by the Government of India between 1948 and 1963. Therefore, the payments which are shown in Table 6 of the 1964 Reserve Bank Bulletin represent the royalty and technical service remittances which have been sanctioned by the Government of India under agreements which have been made by Indian companies with foreign firms.

Shri Kashi Ram Gupta: About clause 5, you have suggested that if the process system has to be adopted for patenting, the burden of proof should lie with the person who infringes. Can you give me instances of a clause in the patent laws of other countries which are governed by the process system?

Shri S. V. Divecha: The patent laws of Germany, Austria, Finland, Greece, Switzerland, Japan, Poland, Yugoslavia, Norway, Netherlands, Sweden and Canada provide for shifting of the burden of proof

Shri Kashi Ram Gupta: As regards clause 47, Dr. Nanji in his speech said, that these imports should be covered which are of outside patents with similar processes, but so far as the amendment given by you and circulated yesterday is concerned, the language is not explicit. Will you please make it clear?

Shri S. V. Divecha: It is extremely difficult for the patentee to prove infringement particularly when the infringed product is imported from other countries because of the simple fact that it is extremely difficult to ascertain by examining the finished product by what process it has been manufactured. The model law for developing countries has incorporated such a provision and we have adopted this provision in our suggested amendment from the model law.

Shri Kashi Ram Gupta: In your suggested amendment, this is one of the local factors, but it cannot be made to apply to import because you have mentioned that it is imported by the same process.

Shri S. V. Divecha: Our amendment covers not only the imported infringing product but also the product made locally by a infringer, because, as I said, it is extremely difficult to ascertain by what process a particular product is manufactured just by examining the finished product.

Shri Kashi Ram Gupta: Are you satisfied that the amendment of yours covers the point which Dr. Nanji has made about the import?

Shri S. V. Divecha: Yes, Sir.

Shri Kashi Ram Gupta: In clause 53 you have mentioned that 10 years'

period from the date of sealing will suffice in certain instances and in certain cases. May I inform you that the present Bill as it stands does not give any time-limit for the period between the completion of specification and the date of grant of the patent? There is no period fixed for it. Do you want that the period should be maintained or it may be left to the option of the Controller-General?

Shri S. V. Divecha: If I may be permitted to explain the whole situation, according to the existing Act, the patent is to be sealed within the maximum period of two years and four months, so that a period of two years and four months, that is, 28 months, elapses between the date of application of the patent and the ultimate sealing of the patent.

The position under the Bill is like this. Between the date of application and the filing of the complete specification a maximum period of 15 months lapses. Between the date of filing of complete specification and the examination proceedings—according to our information, the examination proceedings last on an average for about one year. Between the date of the first objection of the examiner and the meeting of the objection by the applicant a period of 18 months has been provided. In so far as the acceptance of the application is concerned or acceptance of the complete specification is concerned, this period has not been provided in the Bill and it is completely left open. In the Act as it stands at present, as I have said, the maximum period is 28 months.

Shri Kashi Ram Gupta: Are you in favour of the Bill as it stands so far as the period is concerned limiting it to the final acceptance of the patent, that is the date of sealing, or do you want a period to be fixed also so that within that period the sealing must be done?

Shri S. V. Divecha: Yes, Sir, we want the period to be mentioned.

Shri Kashi Ram Gupta: You have not mentioned any period; probably, you have not thought over it.

Shri S. V. Divecha: That is precisely what I am trying to point out. Under the existing Act it is 2 years and 4 months and now the Bill gives a maximum period of 4 years and six months. So I am entirely in agreement with the hon. Member when he suggests that some time limit should be fixed.

Shri Kashi Ram Gupta: Clause 66—while in your memorandum you have mentioned that the clause be suitably amended, in your amendments you have totally neglected that. Am I to conclude that you do not want any amendment or that you do not want to suggest any wordings for that and you want to leave it to the Government?

Shri S. V. Divecha: In our original memorandum we have suggested that there should be a judicial review against the decision of the State for revoking a patent. That is our suggestion. In so far as this clause is concerned, it is an exact reproduction of the existing Section 25 of the Act.

Shri Kashi Ram Gupta: There is no need for any amendment from your side?

Shri S. V. Divecha: No, Sir.

Shri Kashi Ram Gupta: About licensing of rights you have given your opinion. There is another strong view from the other side, from certain reputed firms, that licensing of rights should be there with the modification that the period should start after three years after the grant of patent and so far as royalty is concerned it should be negotiable. What is your opinion about these two amendments?

Shri Keith C. Roy: It is our submission that the concept of licences

of right is *per se* an erosion of the patent system. That is our basic objection to the concept of licences of rights. I accept that in other countries the concept of licences of rights exists, but I would like to stress the point that, in other countries, the concept is a voluntary concept, that is to say, the patentee himself voluntarily asks that the licence be stamped with "licence of right." In this case we have exactly the opposite position, namely, that a patenee who takes out a patent for a drug or medicine or a chemical is faced with the problem that his patent is automatically *per se* eroded the minute it is sealed, for the simple reason that, by the mere fact of sealing, any person interested can immediately apply for a licence of right. Secondly, the Controller has no option but to grant a licence of right. The orders on the Controller are mandatory and he can exercise no option in not granting a licence of right. Thirdly, in that action or, rather, I would put it, in that inaction, on the part of the Controller, he is not called upon to exercise any independent judgment as to the suitability, the capability and the financial stability of the person who applies for a licence of right to operate the patent.

Shri Kashi Ram Gupta: Basically you are against this clause. If these two amendments are there, that the date of licence of right should be three years after the date of sealing and that the royalty should be negotiable, will it not be an improvement?

Shri Keith C. Roy: No, Sir, we feel that the amendments which we have suggested should be considered. Section 87 which, *per se*, as I stated in the beginning, goes to the very root and conception of patent rights, is unnecessary.

Shri Kashi Ram Gupta: If these two amendments are there, will it not be an improvement?

Shri S. V. Divecha: The moment you put a limit of three years in respect of the concept which is known as licence of right and the moment you put other limiting conditions which apply to other kinds of compulsory licences in other fields, fields other than food and drugs, the concept of licence of right ceases to exist; in fact, it becomes compulsory licence of a different nature than the one that is contemplated in clause 84. Under the existing Act also, if you will see, there are two kinds of compulsory licences. One is compulsory licence in fields other than food and drugs, and the other is compulsory licence for food and drugs.

Mr. Chairman: You know that U.K. Act has got a similar provision?

Shri S. V. Divecha: UK Act has a provision similar to clause 86 and not clause 87.

Mr. Chairman: If a three-year period with guarantee is provided, why should you object to that?

Shri S. V. Divecha: That difference between clauses 86 and 87 is whereas in the case of clause 87 there is automatic endorsement of the patent "licenses of right" already from the date the patent is sealed, in the case of clause 86 the period of three years is provided. If within the period of three years, the reasonable requirements of the public are not satisfied, the Central Government can apply for such an endorsement to the Controller. This is the distinction.

Mr. Chairman: It is there in the UK Act also.

Shri S. V. Divecha: We have no objection to clause 86.

Mr. Chairman: Suppose a provision is made here which is similar to the provision in UK why should you object?

Shri S. V. Divecha: If the provision is similar to the one in the U.K. Act, we have no objection.

Shri Kashi Ram Gupta: There are three types of research—basic, development and formulation. Clause 53 provides a period of 10 years. What is your view on this?

Dr. S. L. Mukherjee: This ten-year period from the date of the complete specification will vitally affect basic research, it will affect somewhat developmental research also but not so much of formulation research. I say this with a certain amount of confidence and experience because I am intimately associated with pharmaceutical industry for the last thirty years, both in India and abroad. If I can spell it out, as to the concept of basic research leading to the discovery of a new drug, the birth of a new drug starts in the mind or brain of an inventor. With that idea he starts his first work in the laboratories, either in synthesising new compounds or starting with natural plans. If he has synthesised the compound, at the first flash of a positive pharmacological activity he takes out a provisional patent specification, which merely makes a statement of invention and nothing else; no example is required, no claim is required. That is, at the first positive sighting of a pharmacological property of a new compound and he files his provisional application. Between the provisional and the complete, one year or fifteen months is given, and that is the time when he actually starts intensive laboratory work. What he has done is he first found a compound, which has got this property. Suppose he has found some anti-tubercular compound which has shown some significant property. Around the basic molecule, he works and he synthesises hundreds of compounds to find out whether it is significantly good or whether a new compound is better than what his compound has first shown. So, that fifteen-month period, is used in finding out whether his provisional specification will sand; otherwise, he would leave it out completely. Then a large number of analogous compounds are synthesised to arrive at the best in the laboratory and then the complete specification is filed, covering all grounds, after selecting the best compounds after detailed pharmacological, toxicological, biological drug metabolism studies are made. These are all laboratory tests to find out the highest therapeutic index and the least adverse toxicity factor. So, the detailed procedure of screening and establishing a new drug requires 7 to 8 years.

Shri Kashi Ram Gupta: That is not my question. Which type of research is affected by this provision about ten year period? Do you mean to say that basic research is more hit by this Bill?

Dr. S. L. Mukherjee: In addition to basic research, I also wanted to submit that process development work for making the production of new and known chemicals or pharmaceuticals, depending on the complexity of the synthesis, or isolation techniques, as in the case of antibiotics, requires nothing less than 4 to 5 years.

Mr. Chairman: In your own memorandum you have stated that practically no basic research is being done in India. Then, as you know, the tendency today is to shorten the period of patents for foods and drugs. Several countries like USA, UK, Canada, South Africa and New Zealand have set up committees to go into this question and some of them have actually reduced the period of patents. In this Bill we have prescribed ten years. Do you think it is insufficient for food and and drugs, leave alone basic research? You have yourself stated that we are not doing basic research and that all that we are doing is quality control. So, do you think that the ten years period in the Indian law is insufficient?

Dr. H. R. Nanji: With due respect, it is not correct to say that no basic research is done in India. At the moment, Hindustan Anti-biotics, CIBA Aesearch Centre and Alembic are doing it. The momentum is growing and in the next ten years very considerable progress will be made in basic research. This ten-year period will come in the way of basic research.

Shri Kashi Ram Gupta: They could have suggested some extra period only for those patents which are applied for from the point of basic research. When the patents are applied for from other points of view, then naturally ten years should suffice according to their own statement. That is my point.

Dr. H. R. Nanji: The majority of patents, I shou'd say, are taken only for products of basic research, not for development work.

Mr. Chairman: A lot of time is taken between basic research and finalisation of the actual product and the patent comes only after the drug is finalised, not before. It is only after pharmalogical and clinical trials that the patent comes in.

Dr. H. R. Nanji: Clinical trials are he'd first.

Mr. Chairman: I know that.

Shri Kashi Ram Gupta: Your organisation is a big organisation and basic research can be done only when there is large capital. Has your organisation thought of having a basic research institute of your own in the country so that all these difficulties could be removed?

Dr. H. R. Nanji: There are a number of companies which have got plans for it.

Shri Kashi Ram Gupta: They are doing it separately. You say that Rs. 175 crores are spent in America only on research. This could be done only when there is a combined effort. So, why do you not have a combined effort for this so that good results can come side by side with the public sector?

Dr. H. R. Nanji: Research on a co-operative basis is not possible in the private sector.

Shri Kashi Ram Gupta: There is no question of a co-operative basis. The question is of funds being made available to an institute which could be constituted by your combined effort, just as the Shri Ram Institute has its own funds.

Mr. J. Reece: In the pharmaceutical industry competitive research is very important. A number of different institutions working on the same problem are not necessarily duplicating the same methods of arriving at the solution. This has been recognised quite recently, tangibly, by the fact that single companies have set up competitive research institutes in other countries. Indeed, the Ciba research centre and other centres that are planned to be set up in India are a demonstration of the fact that a number of people now realise that if they can get competitive research going in different areas, it will resu't in better products more quickly.

Mr. Chairman: That means, bigger fish swallowing the smaller fish.

Shri Kashi Ram Gupta: So, basic research unit can be put up by these individual concerns. Then, what is the average capital expenditure and recurring expenditure on such a unit?

Dr. S. L. Mukherjee: We in the Sarabhai are already engaged in a certain amount of basic research with the idea of discovering a new drug. Our screening facilities today is of the order of 200 to 300 compounds in a year, which is nothing. We are seriously going into the idea of establishing a basic research unit which would be productive and remunerative. A lot of peop'e have worked out the minimum critical size of a laboratory which will produce better re-

sults. You all know that the chance of striking a drug is in the region of 1:3,000 to 4,000. Unless a research establishment is set up to screen at least a thousand drugs every year, it may not be possible to find any new drug within three or four years. With that object in view we have attempted and tried to find out the minimum critical size of the laboratory which would require a capital investment in the region of about Rs. 60 lakhs and employ about 30 scientists with auxiliary and ancillary staff—125 in all—and the revenue expenses have been calculated at Rs. 30 lakhs per year.

Shri Braj Bihari Mehrotra: Dr. Nanji has suggested the deletion of clause 48 and has argued very vehemently for that. Will not the deletion of clause 48 help foreigners to exploit the situation?

Dr. H. R. Nanji: I cannot understand how clause 48 will enable foreigners to exploit.

Shri Braj Bihari Mehrotra: 90 per cent of the patents are held by foreigners. How does he say that the foreigners will not exploit the situation?

Dr. H. R. Nanji: All import is to be done by Government.

Shri Braj Bihari Mehrotra: He has said that the deletion of clause 48 will help the trade and industry. He has not described how the industry will be helped.

Mr. Chairman: This is a clause which enables the Government to import medicines.

Shri Braj Bihari Mehrotra: Even if the imports are made by Government, the money will go to the foreigners.

Mr. Chairman: He says, "Pay as compensation and give us an opportunity to be heard".

Dr. C. B. Singh: We have provided here different periods for other things and for food, pharmaceuticals and medicines. How many countries are there in the world which make such distinction?

Shri S. V. Divecha: We will compile the information and give it to you.

Dr. C. B. Singh: You have given a list of per capita expenses on drugs in some of the countries, USA, UK etc. Have you any idea about the per capita expenses on drugs in India?

Mr. J. Reece: The per capita expenditure on drugs in India is an indication of the size of the problem. If you take the Third Five Year Plan target of Rs. 175 crores and if you take 450 million people. . . .

Dr. C. B. Singh: 490 million.

Mr. J. Reece: It will be in the region of Rs. 4 per head per year.

Dr. C. B. Singh: That figure compared to other countries is very small.

Mr. J. Reece: Very small.

Dr. C. B. Singh: With the idea of giving better drug facilities to an average Indian who cannot have even two square meals a day and not even clean drinking water, would you suggest anything to bring about a substantial reduction in the prices of drugs? Supposing most of the amendments proposed by your organisation are accepted, what do you suggest to bring down the prices substantially so as to make them available to the poor people in India?

Mr. J. Reece: This is a very difficult problem and a very different question.

Dr. C. B. Singh: We want to solve this problem.

Mr. J. Reece: First I may say, that patents are not directly related to high prices. If I were to give an answer to this question, I feel what we are really talking about is reducing the costs. Therefore, the costs of

pharmaceutical products in this country have to be considered. In order to maintain prices, which in the context of rising prices amounts to reduction in prices, the sort of thing we could coceive immediately would be either the abolition or reduction in direct taxes on the pharmaceutical industry. After all, there is sales-tax; there is excise duty; there is general taxation; there is customs duty on intermediates and all that. All these are, in effect, direct taxes on sick people. Now, even if we concede that you cannot abolish these taxes completely, it could be argued that for medicines these could be reduced and if they were reduced, then perhaps there will be something like a 10 per cent reduction in the prices of drugs straightway. If raw materials could be made available at lower prices, that would definitely result in reduced cost which would result in lower prices. Raw material costs are rising rapidly. The price of streptomycin, for example, has risen from Rs. 175 to Rs. 225 and it is going to rise again. In these circumstances we cannot think in terms of reducing prices.

The other suggestion about reducing prices and costs would be this. In the context of devaluation, we are hearing from many sources that if we could free the pharmaceutical industry from the artificial restrains of licenced capacity, we could increase our production per unit and increased production means lower costs and lower costs mean lower prices. If also we were released from arbitrary price control which has been imposed upon our industry, there will be free competition, and free competition, we also know, has reduced prices,. Now, the chart which has been presented to the Committee demonstrates quite clearly that left on its own, the pharmaceutical industry has an enviable record of reducing prices.

Finally, we have already pointed out that with an expenditure on drugs of Rs. 4 per head per year there is a limit to what an individual industry itself can achieve in this regard. It is surely no solution to force the pharmaceutical industry to work at an uneconomic level.

Dr. C. B. Singh: That I am not suggesting.

Mr. J. Reece: Then, there should be an extension of health services within the country which will help to bring drugs to the homes of poorer people at lower prices.

Dr. C. B. Singh: Will you suggest some such provision in this patents Bill specially for drugs of common use for an average poor man? Do you think something can be incorporated in this Bill?

Mr. J. Reece: Frankly, it seems to us that there are two separate questions, patents are one, and prices and health services, etc. is another. We honestly cannot see how a patent legislation by itself can properly incorporate all these other considerations.

Dr. C. B. Singh: In your graph that you have presented to the Committee about the production of basic drugs in India in 1964, you have mentioned the following figures:

Antibiotics . .	Rs. 88.6	millions
Sulpha Drugs .	Rs. 15.1	„
Anti-Tubercular Drugs . .	Rs. 14.0	„

All these three are, more or less, to fight certain bacterial and infectious diseases. The highest amount is being spent on antibiotics. Do you think something can be done to bring down the prices of these antibiotics which are the dire need of the country.

Mr. J. Reece: The bulk of the antibiotics figure is penicillin and streptomycin from the public sector in the country. But I ask: What do you mean by high prices? High in relation to what? If it is in relation to cost of production, then, if it is a complicated and a complex process, there must be a minimum cost of production

and, therefore, there must be a minimum price which has to be paid. If it is in relation to the results achieved, then, after all, today we can give a patient suffering from Pneumonia 12 capsules of antibiotics and he is cured. Before a cure could take many months. So, I want to know: High prices in relation to what? We say in answer to this question, if the artificial restrain's are removed from the industry, prices will come down because we are constantly trying to cut each other's throat.

Dr. C. B. Singh: Evidence has come from the reputable persons who have appeared before this Committee to the effect that the abrogation of the patent law will bring down the prices and they have said that they will flood the market with cheap drugs. What have you to say about that?

Mr. J. Reece: I may just say one word in reply to that, that is, Italy. In Italy, the prices of drugs are higher than anywhere else in Europe. That is what would happen here.

Dr. C. B. Singh: Talking about research, in spite of the claims made by CIBA, Alambic, Sarabhai and even PFYZER to the effect that they are spending a lot of money on basic research, you will agree that though there was a strong patent protection from 1911 and it is still there, in spite of all this, there has been hardly any research in this country. Of course, something has been done in the last five or six years. But still there has hardly been any progress in the field of research.

Mr. J. Reece: The pharmaceutical industry is a new industry all over the world and has been in existence only for the past 15 or 20 years. Almost every country has been saying the same thing that, before the War, we were dealing only with a few vegetable products, a few simple drugs that required no investment or research and that it is only after the Second World War that the whole technology of pharmaceutical industry has been developed. As you have seen from the progress of our own industry, we are on the threshold, we believe, of being able to make real use of technology that has come to India and we are in a position to make use of patent protection in order to discover more life saving drugs.

Dr. C. B. Singh: Your Association has taken a strong exception to the provision of licences of right. "Licences of right" has been incorporated because of a very important reason. You know the difficulty of the public in obtaining drugs. We, therefore, felt that a provision of this type would be of help to us. But you have taken a strong exception to that part of the Bill. How will you feel if we maintain those clauses and also incorporate that for licences of right, adequate compensation will be paid to the patentee? Will that be an improvement on the present provision in the Bill?

Mr. J. Reece: My colleague, who is more knowledgeable about it, has commented on licences of right. I would like to say something subjective. We are in the process of bringing a great deal of technology to India and licences of right is going to frighten the people away from bringing technology to India. We feel that a provision to bring in drugs in emergencies, for example, during an epidemic of cholera, etc., is already made; nobody will object to that; that would serve the purpose well. But we should not frighten people away from bringing technology by putting in this "licences of right" clause when it is not necessary.

Dr. C. B. Singh: Probably you know the background of 'licences of right' and this brings me back to the unfortunate 4 or 5 cases going on in courts in this country. What have you to say on that part of it?

Dr. H. R. Nanji: I am particularly aware of one case—that of Neo-Pharma. The delay in the licensing procedure in their case has been due

to several factors. For some time I was acting as Consultant to this firm. Neo-Pharma have shifted their stand more than once. In the first instance, they had taken the stand that the process of their foreign collaborator was totally different. After some advice which was tendered to them, it was made clear to them that the process of Archifar clearly infringed the rights of Parke-Davis. Afterwards the stand was shifted and then they asked for a compulsory licence. The stand which has been taken by Parke-Davis is this: they are prepared to give compulsory licence direct to Neo-Pharma but not through a firm which they consider is an infringer of their patent in Italy. Moreover, there are quite a few suits pending against this firm—Archifar—in different countries and if Parke-Davis agree to give a licence in this country, it would compromise their position in other countries.

Dr. C. B. Singh: When the Neo-Pharma representatives came here, they gave an evidence that they tried their best to come to terms with Parke-Davis; they went to America and spent lot of money, but Parke-Davis people more or less rejected their terms for coming to an agreement. Is that correct?

Dr. H. R. Nanji: To my knowledge, that is not correct.

Shri D. P. Karmarkar: You had made observations here about patenting of product *per se*. Is it your idea that, if product *per se* is patented, then no one else will be encouraged to invent another process for the same product?

Dr. S. L. Mukherjee: I may express my personal views in this matter. The maximum protection that could be given to an inventor is product *per se* protection, but in view of our country's development and existing research facilities, etc., I am of the opinion that product by process would be an ideal protection at least for some time to come.

Shri D. P. Karmarkar: This is regarding your observations regarding Clauses 99 and 100. There you say "for the purpose of government". Would you be happy if instead of "for the purpose of government", the words "in public interest" are substituted, public interest meaning defence, security of the country, epidemics, bringing the prices down and things like that?

Dr. H. R. Nanji: Bringing down prices cannot be considered as public interest. Unless you examine all the factors for the price rise, it cannot be considered as a matter of public interest. Defence and other considerations would, of course, be matters of public interest.

Shri D. P. Karmarkar: A point was put up before us sometime ago that, in order to avoid multiplicity of forums for filing suits of infringement, there should be only one forum for the country, so that the party against whom the so-called aggrieved party is proceeding may not be made to run to Madras or Calcutta or Bombay. Would you prefer a single tribunal for this purpose?

Shri S. V. Divecha: Are you suggesting a single patent appeal tribunal?

Shri D. P. Karmarkar: Not appeal, even in the first instance.

Shri S. V. Divecha: According to the Civil Procedure Code, the creditor finds the debtor and not that the debtor finds the creditor.

Shri D. P. Karmarkar: Let us forget the Civil Procedure Code. Let us concern ourselves only with patent laws. In view of the possible number of forums into which a party may be dragged for a possible infringement and considering the number of such cases that may arise, would you think that it will be in the interest of both the parties if there is a single tribunal for this purpose at a central place?

Shri S. V. Divecha: Decentralised tribunal would necessarily be a High Court, I think. If that is so, we would have no objection.

Shri D. P. Karmarkar: The other point is with regard to judicial tribunal. We mean by that a particular kind of tribunal. Dr. Nanji mentioned about Income-tax tribunal, sales-tax tribunal, etc. These have on their panel men of proved judicial experience. These are established under various laws. Do you think these will work and would be enough for your purpose?

Shri S. V. Divecha: They might work.

Shri D. P. Karmarkar: Dr. Nanji also said something about the Price Advisory Commission like the Tariff Commission. Presumably it would be functioning not only with regard to the fair prices for new manufactures, but would also regulate prices of imported products. Would there be any objection to that? I am asking this question specifically because along with patent rights there is the right of exclusive importation for a certain period. There are some cases before us where some people have taken the advantage of that monopoly. I do not want to cite instances. You should be knowing them. Under such circumstances, would this body also function in relation to the fixing of proper prices for imported commodities also?

Dr. H. R. Nanji: Tariff Commission has already instituted enquiries in regard to three or four drugs in the past. While doing so, they will certainly take into account the reasonable price for import. If the import price is regulated by indirect measures like customs duty...

Shri D. P. Karmarkar: Other things being equal. Today the price is very high in spite of all that. The law allows you perfect freedom to fix any price. Under the Essential Commodities Act or the emergency there are no powers. If the consumers are to be protected, there should be some mechanism to advise regarding prices of imported commodities also.

Dr. H. R. Nanji: If the Tariff Commission comes to the conclusion that the prices are very high, there is already a machinery for taking care of the matter. There is a schedule in the Red Book.

Shri D. P. Karmarkar: Red Book merely says what shall be imported and what shall not be.

Dr. H. R. Nanji: There are a number of drugs there.

Shri D. P. Karmarkar: Drugs are mentioned and it says that the prices shall not be more than this. It only regulates the type of drugs. In essence I think you agree that there should be some reasonable mechanism acceptable to everybody to regulate the prices of imported things.

Dr. H. R. Nanji: Yes.

Shri M. L. Jadhav: The Model Law suggests ten year period for the patent from the date of specifications. The present measure also suggests the same thing. Have you got anything to say on this?

Shri S. V. Divecha: So far as the model law is concerned it is true that it suggests that the patent will be valid for at least ten years. I would however invite attention to page 49 of the Model Law. I would read from it:

> "It is, however, to be noted that too great deviations from the generally accepted standards would not be to the advantage of any country because it is in the general interests that rules concerning duration be fairly uniform throughout the world."

Shri M. L. Jadhav: From your observations, am I correct to say that

you have no objection to the use of the patent by Government for epidemic or defence purpose and you only object to its being used by public enterprises?

Dr. H. R. Nanji: You are right.

Shri M. L. Jadhav: Do you think that patent is one of the important factors in keeping the high prices of medicines?

Mr. Chairman: There are several other facts. He said that. He elaborated on that.

Shri M. L. Jadhav: The price of Tolbutamide powder varies between some Western countries, Italian concerns and your member-firms. Can you explain the reasons?

Mr. J. Reece: The chart which we have given sets out two things. One is to demonstrate that prices in India are not uniformly higher than elsewhere as has been alleged. The other is to show that price in Italy is not the lowest in the world. There are differences and variations, and Dr. Nanji explained in his exposition the difficulties in comparing international price. The point I would like to make is that we should not consider one drug, but the fact is that in Italy a consumer is paying more for his drug than in Europe. That is the general principle over the whole range of pharmaceutical products.

Shri Arjun Arora: May I know how many members of this organisation are firms which are absolutely foreign to India having no Indian capital?

Mr. Chairman: He said he could not give the break up. He will send that information.

Shri Arjun Arora: How many of the members are subsidiaries of foreign firms and of the subsidiaries how many are wholly owned and how many are partially owned and in the case of partially owned, who are the Indians who own in part?

Dr. H. R. Nanji: We will send the information.

Shri Arjun Arora: How many members of this organisation are firms which have collaoration agreements with foreign firms?

Dr. H. R. Nanji: We can send it.

Shri Arjun Arora: I would also like to know how many are patentees and how many are licensees of foreign patentees? Is there any member who is using no foreign patent and having no foreign collaboration?

Mr. Chairman: Can you answer that?

Dr. H. R. Nanji: We will send the information.

Shri Arjun Arora: Is there any organisation which has no foreign capital, no foreign patent, but is absolutely *Swadeshi*?

Dr. H. R. Nanji: I have already mentioned the names of Alembic and Unichem.

Shri Arjun Arora: You also mentioned Sarabhai Chemicals who are famous for calloboration agreements. May I know whether your big organisation is so powerful that it can lure away the members of the staff of the Prime Minister's Secretariat and has ever cared to conduct a survey relating to the period during which the cost involved in research was recovered? We have been subjected to long lectures on virtues on patent and we have also been told that patents are necessary because cost is involved in research. So, we would like to know as to what is the period during which an average firm recovers the cost of research of a particular drug and whether your organisation has carried out any survey amongst your members relating to this?

Mr. J. Reece: In answer to this question, I would say that nobody has done any survey on the cost of research done for a particular drug.

Research cost is a general charge on the company. In some cases, as you must have heard already, vast sums of money are invested without any return whatsoever. I may make my point clear. If a company is making pharmaceutical products and marketing them under its own name, at some stage or other, it will have a competitor in the pharmaceutical industry. Even if I discover a new drug I can't guarantee there will be no competitor as Dr. Mukherjee explained. I may put in Rs. 7·5 lakhs as my capital and only get a return of Rs. 5·0 lakhs out of that. In that event I do not get anything from that for the future. Take for example the discovery of a drug that would cure cancer. That would be the most expensive drug in the world if ever it is put on the market. Think millions and millions of rupees that have been spent in trying to discover a drug for curing the cancer. For all the drugs which an individual company makes, it has its own allocation and assessment of the future and as such puts aside a certain amount of its earnings to do research. It may or may not succeed.

Mr. Chairman: We heard CIBA. Is there any other company which has invested money on research?

Mr. J. Reece: There are a number of companies who have done that. If I may submit, there are different ways of trying to do research. In the case of CIBA, they had chosen to put up a research centre with scientists who will try to discover a new drug.

Mr. Chairman: That we have seen. Excepting CIBA is there any other company?

Mr. J. Reece: You yourself have seen in our own case that four or five different teams are working on an entirely different basis.

Mr. Chairman: That was only qualitative control.

Mr. J. Reece: With due respect I say that it is not qualitative control. We have discovered several new process methods. In the near future, they are going to make a major contribution to our company's chief activity. They relate to the utilisation of local raw materials. In this case Indian Chemists have put their heads together to find out the methods of import substitution for the basic raw materials. This is process research, and we expect that it will not be long before we get results from it. Of course research is costly.

Shri Arjun Arora: May I now whether all the expenses that you incur on research of various drugs which you are able to find you put them as normal expenses of the industry?

Mr. J. Reece: It is like that. In certain other countries an amount is allocated for research in order to try and demonstrate the cost. In answer to the question whether we have put up different research sections, I would say that there is now a Glaxo Research Company that does not make any product for sale. It is an investment in research.

Shri Arjun Arora: You may not be doing.

Mr. J. Reece: We have been doing production not in terms of research.

Mr. Chairman: Do you mean to say that research is only an answer. If you refer to the report in the U.S.A. you will find that .35 per cent is on sales promotion.

Mr. J. Reece: I cannot say. The quantum of what is reasonable to spend on research is something for individual companies. Some companies have spent much more than the figures which you have mentioned. Some spend nothing at all.

Mr. Chairman: I am telling you from the Committee Report. It says: From only 1961 onwards 4 per cent of the profits is spent on research and this may be recovered in about two

to three years' time. From the production of about 700 million dollars, 35 per cent or so has been spent on sales promotion. Do you agree with this?

Mr. J. Reece: I do not agree with this figure. I cannot challenge the figures you have stated. But, I cannot agree with the view that the research is a minor part of the pharmaceutical industry. I have no doubt that the question of sales promotion will come up again in some other context. How much is to be spent on research etc. is a matter of opinion. Take for example Hindustan Antibiotics which is a research based unit.

Mr. Chairman: It is a public concern—a Government concern.

Mr. J. Reece: It has allocated one per cent to research.

Mr. Chairman: However, the amount is spent by Government.

Mr. J. Reece: I say that it has allocated a certain amount on research which comes to 1 per cent.

Mr. Chairman: It is only from the percentage of profits that they are making. In their case, it is made by C.S.I.R. or Government.

Shri Choudhuri: Hindustan Antibiotics is a private company coming under the Indian Companies Act. Its research expenses come out from its sales.

Mr. Chairman: Though it is a company, it is a public undertaking.

Shri Arjun Arora: My question leads to so many supplementaries. Now coming back to my question I put to you, your view is that research cost is not allocated to a particular drug. So, there is no question of recovery of the cost on research from a particular drug. You may spend a large amount of money with no results and may spend larger amounts and discover a drug which will not use the large profits. Yet you may discover something which does not cost you much which gives much yield. Is that the position?

Mr. J. Reece: That is exactly the position.

Shri Arjun Arora: Would you tell me which of the Members of your organisation is engaged in real basic research irrespective of the cost?

Dr. S. L. Mukherjee: I can speak only for my organization, Sarabhai Chemicals.

Shri Arjun Arora: You are not appearing only for Sarabhais. You are appearing for the Organization of Pharmaceutical Producers of India.

Dr. S. L. Mukherjee: As I told you our annual turn-over of new compounds in our Basic Research Division is about 200-300. We are also taking advantage of screening facilities as available with the Central Drug Research Institute, Lucknow where we do not have the facilities with us.

Dr. M. M. S. Siddhu: Are you payiny anything for those facilities?

Dr. S. L. Mukerjee: We have tackled this question but they are not accepting any payment.

Dr. M. M. S. Siddhu: So you get it free.

Dr. S. L. Mukherjee: We have got only 20—30 compounds screened by them, so far.

Shri Arjun Arora: While on this subject of research, I would like to know whether the drug industry or the pharmaceutical industry would prefer to have an institution like that of ATIRA in Ahmedabad where the cotton textile industry has combined, collected funds and set up an organization like the Cotton Research Institute?

Dr. S. L. Mukherjee: To my understanding and experience, the development of a new drug requires a tradition, a culture and a definitely different discipline and if you would look around, you will see that the individual companies' research efforts have contributed uptill now everywhere in the world to 95 per cent of the drugs that have been discovered till this date. It is not through Universities and co-operative research associations that the drugs have been manufactured. I do not know the reason, but to me it appears that when we work in the industry, we have a pragmatic approach. We have quite a different discipline. We have perfect team work, which may not be there in Universities or co-operative research associations. Secondly, I say from personal experience of the CBRI, when we approach them to get some drugs screened through their facilities, a condition is imposed on us, that we must disclose the identity of the drug, before they can take up the work. Many private firms would hesitate to disclose the identity of the drug to such co-operative institutions. So, it is research within industry that will give the results. Hayemicin is one such example. Unless you set up research within the industry itself, as also help to create the necessary climate and the conditions for research, it is my considered opinion that it will take a long time for invention of new drugs.

Shri Arjun Arora: May I understand that the drug industry in India is not only a research-based industry but is also an individual based industry in which no co-operation is possible?

Mr. J. Reece: May I just say a few words on this? One of the advantages of putting the research into a commercial company instead of a public laboratory is you select the scientists and you follow up the research done by them internally on a certain project and if they are doing something which will be of no use to anybody, you can call a halt to the Project, and divert them to other more useful avenues.

Shri Arjun Arora: From the national point of view if two or more than two firms are engaged on the same research, the ultimate result is waste in two or three places.

Dr. S. L. Mukherjee: I think competitive research is absolutely necessary. There I differ with the views expressed by the hon'ble Member.

Shri Arjun Arora: Some people seem to think that absence of a patent law gives a momentum to research. What is your opinion on that?

Mr. J. Reece: If there was an abrogation of patents—we are not discussing abrogation of patents and it is also not contemplated by the present Bill—it would stop research. Prof. Ermst Chain, one of the great scientists of our age, has written on the development of Penicillin and he put the whole thing in a nut-shell—'No patents, no new drugs'. Prof. Fleming did not get a patent for his discovery of penicillin but initially no one was interested. It was research in the pharmaceutical industry that developed the means of making penicillin available to the people.

Dr. S. L. Mukherjee: May I supplement one part of Mr Reece's statement? Penicillin was declared as a drug of unstable character, of no human interest at the time of its discovery. That was the declaration of Prof. Raistiric of the London School of Hygiene and Tropical Medicine and he declared that penicillin will not be of any commercial use because it is quite unstable.

Shri Arjun Arora: Coming back to royalty, what do you think should be the fair rate of royalty?

Dr. H. R. Nanji: We have already submitted that. All we want is not to have any ceiling on royalty. In some

cases even the 5 per cent is too much. In other cases it will be necessary to have more.

Shri Arjun Arora: Your conception of royalty is: reward for research.

Mr. Chairman: He wants it to be left for negotiations.

Shri Arjun Arora: Your conception of royalty is that it is a reward for research and they are unable to allocate expenses on research relating to particular drugs. Am I to understand that they want the industry to run profitably but do not expect royalty from each item of research?

Mr. J. Reece: A man may be working on a certain project for 20 years another man may in the course of half an hour discover something. How do you assess it and what value are you going to place on the finished product. You have seen the pharmaceutical plants and you will realise how complex the processes are—very very complex drugs and surely therefore there can be no fixed return for research.

Shri Arjun Arora: So you want royalty to be a matter of bargaining?

Mr. J. Reece: That is correct, Sir.

Shri Arjun Arora: Because you can't suggest any scientific basis for its determination?

Mr. J. Reece: Correct, Sir.

Mr. Chairman: Royalty is paid to the scientist or to the firm?

Mr. J. Reece: To the firm.

Shri Arjun Arora: What is the highest rate of royalty any of your members is paying to any patentee?

Mr. J. Reece: I can give one example. Very recently in England, in a negotiation for royalty on a particularly complex process, the department of the Government which awards royalties, awarded 18 per cent as royalty for this particular process. It was 18 per cent on sales, not on bulk. I can't remember the patent, but I believe the firm was Geigy.

Shri Arjun Arora: I want to know the highest rate of royalty that any of your members in India is paying to a patentee whose patent you are exploiting under licence.

Mr. J. Reece: I would like to be able to give the answer because I am sure it is a very low figure and in some cases no royalty is charged at all. We must look up that figure and give it to you.

Shri Arjun Arora: Also please look up what is the lowest rate that any of your members is paying and send it to us.

Dr. H. R. Nanji: For this information, the best source would be the Department of D.G.T.D. They have got all the data about royalties.

Shri K. V. Venkatachalam: In some cases it is as high as 15 per cent because that was in accordance with the policy of the Government at that time 10 years ago. Now, progressively the rate of royalty is being brought down. It is round about 5 per cent now.

Shri Arjun Arora: I want to confine my information to the members of this body.

Shri K. V. Venkatachalam: What I have said will broadly apply to the members of this body also.

Shri Arjun Arora: No, I want the exact information. Please collect this information—the highest and the lowest rates of royalty that any of your members is paying—and send it to us.

Now, do you agree with the concept that there should be a progressive reduction in the rate of royalty as time passes?

Dr. H. R. Nanji: Royalty agreements are always subject to revision every five years, and at that time Government does bring pressure to reduce it. Sometimes no royalty is paid after five years.

Shri Arjun Arora: Leave pressure alone. Pressure can be rightly applied or wrongly applied and when wrongly applied, it will result in explosions. Should there be a general rule that royalties should be progressively reduced every year or so?

Shri Keith C. Roy: I think the Hon'ble Member may be aware that one of the main features of general collaboration agreements these days is that all new know-how is also made available in addition to that which is made available under the original agreement. Therefore, my submission is that it is not a correct concept to say that the rate of royalty should gradually be reduced.

Shri Arjun Arora: You have told me about what is happening. I want to know your views about what should happen regarding progressive reduction of royalties.

Shri Keith C. Roy: My answer is that it is not a correct concept to suggest that the rates of royalties should gradually be reduced.

Shri Arjun Arora: Are you agreeable to the proposition that the cost of drugs should be such that the consumer is able to get it and that the prices must be progressively reduced?

Mr. J. Reece: As we explained already, in a free area of competition, this is exactly what happens.

Shri Arjun Arora: Should it be laid down that after every two years or so, the prices should come down by a certain percentage?

Mr. Chairman: How can we lay down? It is beyond the scope of the present Bill.

Shri Arjun Arora: Mr. Chairman, I want these experts to tell us how the prices of pharmaceutical products in India can be brought down.

Mr. Chairman: He has already said that there should be no control, taxes should be reduced, raw materials should be supplied at a lower rate and so on.

Shri Arjun Arora: On page 14 of the Supplementary Memorandum on Patents Bill, the table gives the turn-over of the whole industry or only of your members?

Shri Keith C. Roy: As Dr. Nanji said, at the time this survey was made, we had something like 67 members. I think, perhaps, I might state, in order to try and put these figures into their proper perspective, that there are some 1700 or 1800 units in India manufacturing pharmaceuticals. Of these units, approximately 125 are registered with the Directorate General of Technical Development and are considered to be the major units. Of these 125 major units, at the time this report was prepared, we had some 65 members. The production of those 65 members represented over 50 per cent of the total production of the country. That was, Sir, in 1965, Rs. 135 crores. This sample survey, of which the figures are placed on page 14, represents the turn-over of practically half of the total value of the production of pharmaceuticals in India.

Shri Arjun Arora: Could you please tell us how many of these concerns included in the Survey are subject to overseas payments or are all of them subject to such payments?

Shri Keith C. Roy: I will have to explain the details to you. I will send them to the Committee. I am sorry I do not have all the figures with me on that basis.

Shri Arjun Arora: You have said that the overseas payments are 3·1 per cent of turn-over. In case the

total turn-over figures given by you include firms like Unicom which do not make overseas payments in the form of dividends, royalties etc., your percentage is altogether wrong.

Shri Keith C. Roy: I submit with respect, Sir, that the figure is not wrong.

Shri Arjun Arora: Percentage can be very elusive thing.

Shri Keith C. Roy: It may be elusive but . . .

Shri Arjun Arora: 3·1 per cent of what?

Shri Keith C. Roy: Of turn-over.

Shri Arjun Arora: Whose turn-over?

Shri Keith C. Roy: Of the turn-oevr of the units which were surveyed, and who represent half the total production of India.

Shri Arjun Arora: Could you tell us how many of these half the producers of the pharmaceuticals in India do make overseas payments and how many do not and what are their respective terms?

Shri Keith C. Roy: I am sorry, Sir, I have not got the figures with me. I will supply them.

Shri Arjun Arora: My submission is that 3·1 per cent is a cooked figure. Coming to page 20, at the bottom, you have said: "None of the firms producing the imitation products, whose prices were considerably lower than the original, have been able to remain on the market". This is what you say about Italian firms. What is the basis of your assertion that firms whose prices were considerably lower than the original were driven away from the market by concerns whose prices were considerably higher?

Mr. J. Reece: These figures were supplied by a particular person who was interested in this particular subject, but it is not really very difficult to appreciate because we are dealing in drugs, pharmaceuticals and medicines for the cure of sick people and one of the most important ingredients is the ingredient of confidence. If somebody offers you a drug at a very low price, it is natural for many people to immediately question whether it is going to do what the makers claim it would do, or not. There is a story which we tell to our representatives during their training course about the question of confidence and to stress the need for them to be well-equipped and to know their subject. It relates to a man who bet another man: "That I will not be able to give away a guinea for Rs. 10" and the person did not believe him. So that man went out into the street, dressed himself as a beggar, stopped passers by and said: "Here is a golden guinea. Will you please give me ten rupees". And no body took it.

Shri S. V. Divecha: This information which we have was gathered from an official report by Professor Bergami of Italy to the Italian Government.

Shri Arjun Arora: Am I to understand that higher pressure—the salesmanship which firms charging more are able to indulge in because they can afford to spent more on salesmanship—has achieved this miracle.

Mr. J. Reece: Not that at all. It is basically an understandable desire by the medical profession and people who want to get their products like drugs, or food, from companies who are reasonably well established in a particular field and have a reputation, because they know that those companies are not profiteering because they know that the money that have spent on quality control etc. is going to guarantee that product.

Shri Arjun Arora: Indian members of the delegation will perhaps be able to appreciate, in India everything

which is cheap sells faster and if you have any guinea, I am prepared to buy it for Rs. 20 right now.

Mr. J. Reece: I have not got one, Sir.

Dr. S. L. Mukherjee: What is true to public may not be true to the medical profession. We are dealing with selective medical profession. They may not accept the lowest, they accept the best.

Shri Arjun Arora: Doctors take pleasure in prescribing costlier medicines.

Mr. J. Reece: No, Sir, they do not take pleasure. In fact, one of the main arguments we can produce to demonstrate that our prices are reasonable is that they go through the medical profession and it is the medical profession which alone has to decide what to prescribe for their patients; and this is a real control on the question of cost and price.

Shri Arjun Arora: May I know what is the percentage of turn-over that your members spend on advertising, samples, literature sent to doctors, presents made to doctors etc. that is salesmanship?

Mr. J. Reece: It will take a few minutes. Can I make a few general remarks which, I think, are necessary? It is no good discovering a cure for cancer if nobody knows about it. This is the basic postulate. Now, we have to accept it as a cardinal principle that the doctor must have the freedom to prescribe whatever medicine he considers necessary for the treatment of his patients, and the pharmaceutical manufacturers are in competition with each other to satisfy the individual and collective requirements of the medical profession. Thus we are dealing with a limited group of people—doctors—who are going to decide whether or not a product should be used. And the industry never assumes that a doctor is unaware of price because he is not. Now, there is another very important thing which, I hope, will be borne out by the hon. Members who are in the medical profession and who are on this sub-committee. There is a natural resistance to the adoption of new scientific ideas and drugs. There is no guarantee that a doctor will automatically prescribe a drug just because we tell him it is good. And there is another important point, Sir, and that is that it is absolutely essential that the pharmaceutical industry should be in direct and constant contact with the medical profession about the drugs it is making. So this is the whole form of how medical information comes to the pharmaceutical industry. Now we made a survey of our members to find out as to how much we spend on sales promotion and the figure comes to something like 8 to 9 per cent. This figure includes expenditure on advertisements, literature, samples to doctors, etc.

Shri R. P. Sinha: How does it compare with other countries?

Mr. J. Reece: 11 per cent is the figure given in the UK, and perhaps it is not surprising that in America it comes to something like 25 per cent.

Shri Arjun Arora: You claim that some sort of medical education of doctors is part of the responsibility of the industry?

Mr. J. Reece: Far from it. We cannot even dream of giving any sort of medical education to doctors. We only inform them about our drugs and it is for the doctor to judge whether a particular drug is good or bad.

Shri Arjun Arora: Page 36 seems to have been loosely worded by somebody in your organization. You have pointed out that competition is useful.

Mr. J. Reece: With due respect, Sir, I submit that I am talking about Indian conditions. It is quite true that in other countries you can quote the pressure of sales promotion, which does

have an effect and influence on price. In our Indian society we do it to a price lower extent, there is much more information, and much less of what is known as pressure promotion.

In It aly, Sir, there, is no patent protection. From the moment you market a drug, anybody can copy it. It is one of the rules of selling that the company which gets in first gets a major share of the market and so the moment a new drug is know everybody goes all out to do the maximum amount of sales promotion to the doctor. Now the amount you spend, Sir, has no relationship to the type of promotion you do. If I discover a new drug tomorrow, how am I going to contact one hundred thousand doctors in India? How much it will cost me to go and fly all over the country? It is a question of coverage. In Italy, where there is no patent protection everything is spent on promotion to get him (the doctor) first. It is not that in Italy the industry has to spend much more on promotion than anywhere else. Everybody is spending on it.

Dr. M. M. S. Siddhu: Am I to understand that the doctors will choose a drug coming out of a reputed house and the reputed houses need not spend on promotional activities.

Mr. J. Reece: No, Sir, that is not the case. As a matter of fact the houses of repute in this industry have to spend much more than others on promotional activities.

(The Committee then adjourned to meet again at 15.00 *hrs.)*

The Committee reassembled at 15.00 *hrs.*

Shri Arjun Arora: May I know whether any of the very experienced and learned witnesses have come across any cases where patents have been granted, process patents or product patents, even though they should not really have been granted?

Shri S. V. Divecha: I suppose the question is whether we have come across any cases where a patent has been granted which ought not to have been granted, for a process.

Shri Arjun Arora: Both processs and product patents.

Shri S. V. Divecha: This is a matter of statistics. To the best of our knowledge, we are not aware of any such processes, but perhaps the controller would be in a better position to give this information.

Shri Arjun Arora: What precautions would you suggest to ensure that we in this country do not grant patent protection where the patents asked for do not really qualify for such protection?

Mr. Chairman: How can they answar this?

Shri Arjun Arora: What precautions do they suggest?

Mr. Chairman: It is for the controller to say.

Shri Arjun Arora: The witnesses have commented on everything. They can answer this also.

Mr Chairman: How can they say whether a patent is to be granted or not? It is for the patent controller.

Shri Arjun Arora: Suppose.....

Mr. Chairman: There is no question of any supposition. The hon. Member must ask questions within their knowledge.

Shri Arjun Arora: What in their opinion should be the preventive steps to ensure that patents are not granted in cases which do not qualify for such patent protection?

Dr. H. R. Nanji: If they are doing so much of research in the patent office, then normally this kind of thing should not happen.

Shri Arjun Arora: Are they satisfied with the handling of the matter by the patent office in this regard?

Dr. H. R. Nanji: There is no other possibility.

Shri Arjun Arora: How does industry reward the individual scientists who are responsible for inventions? Does industry take away all the profits of the invention on the presumption that the scientist is being paid by it?

Dr. S. L. Mukherjee: There are several ways of rewarding the scientist. There is no set-rule. It differs from company to company and the invention's importance. The first is payment of a lump sum. The second is raising his salary for each invention that goes into commercial production. The third is giving him facilities for further research.

Shri Arjun Arora: The reply is theoretical. Please give specific examples.

Dr. S. L. Mukherjee: For example, for a few patents in India I was rewarded by being given one per cent on the sales of the products.

Mr. J. Reece: Before coming to India I worked in Glaxo Research and my reward was doing that research. Secondly, I had at my disposal the resources of a large compony with all the equipment which they could possibly provide, but for which I would not have been able to fulfil my research ambition at all.

Shri Arjun Arora: Would you like any rules being made by the Government in this respect or are you satisfied with the way that industry is rewarding individuals for their inventions?

Mr. Chairman: It is beyond the scope of this Bill. It does not come under the patent law. Anyway, it is a matter for the Government to look into.

Shri Arjun Arora: It is a matter for this Committee to look into. We can certainly say that one-fourth should be given to the individual responsible for the invention. I am entitled to bring forward such an amendment and I shall press it.

May I know if there have been any inventions by Indians, whether individuals or firms, during the period of the first and second world wars and during the post-war period?

Dr. S. L. Mukherjee: If you mean making a new process for a product which had been patented by other processes, there have been several hundreds by Indians. If you mean discovery of new drugs, we are in the beginning stage, and except for Hamycin and Dermostatia we are not aware of any drug which has come to the market out of Indian invention.

Shri Arjun Arora: So, am I to understand that the patenting of drugs will mean largely rewarding individuals and firms outside India and not within India, because you say there have been no inventions here during the last 50 years or so?

Dr. S. L. Mukherjee: What I said does not mean that we will not reward inventors. If an inventor has done any good to the cause of humanity, wherever he may be, he must be rewarded and his invention must be protected. I do not agree that there have been only minor process improvements. I can say from personal knowledge that we have made processes for anti-malarial and anti-tubercular drugs, and many new processes have been discovered by Indian scientists against the processes which have been patented in India. I feel that at the present stage of research, with the facilities given to the Indian scientists, this is a major contribution.

Shri Arjun Arora: Taking into consideration the present position and equipment for research in India do you think it must take at least 20 years for Indian scientists to be able to compete with foreign scientists in the matter of inventions?

Dr. S. L. Mukherjee: It will depend upon the facilities given to the young scientists and how soon they can come up. The present facilities for basic research are completely inadequate because, if you permit me, I will go a little into the background of the pharmaceutical industry. The pharmaceutical industry in 1948 had a turnover of about Rs. 10 crores. In 1958, the turnover was Rs. 54 crores; in 1964 the turnover was Rs. 135 crores. What we have done, when the turnover is low, is to concentrate on the formulation research.

Shri Arjun Arora: Turnover may not be relevant to invention and research.

Dr. S. L. Mukherjee: I am talking about the background.

Shri Arjun Arora: The turnover may increase merely by increasing the facility.

Dr. S. L. Mukherjee: Without an increase in turnover, there will be no investment, no encouragement for investment of the industrialists towards research. As you will appreciate, research itself is a gamble of the highest order, so far as the discovery of new drugs is concerned. As I said earlier, to create minimum facilities for basic research, it requires Rs. 60 lakhs of capital investment and Rs. 33 lakhs recurring. Unless many units of that nature come into India, we could not achieve results. We cannot say what would be the time that it takes; it may be five years. If you are lucky, you will strike at the results within two or three years. A stroke of luck is always there. People have pursued for 10 years and yet they have not found out a drug. I think hon. Members will realise that once the facility is created, the Indian scientist is not far back in their mental outlook and capacity to go forward for doing good work in research.

Shri Arjun Arora: Will you agree with my proposition that considering the present facilities for research in India, there is a case for a holiday from patens for 10 years to 15 years. just as they talk of a tax holiday?

Dr. S. L. Mukherjee: The present facilities are not adequate enough and as a scientist attached to industry, I feel that the present facilities will be considerably increased during the next 10 years, and within these 10 years we will be able to do something. The other firms abroad have shown that within a decade a lot of things could be done. We hope we will be able to follow them.

Shri Arjun Arora: You have stated the truth but only the half-truth. My proposition is that if we have a holiday from patents for 10 years, there will be an enormous increase of production in the country and there will be a larger turnover and the industry will have a greater fund.

Mr. Chairman: His answer has come.

Shri Arjun Arora: We will be able to get a greater amount of research. What is the harm in reproducing Italy here?

Mr. Chairman: It is a matter of opinion. It is a matter for you to decide.

Shri Arjun Arora: I want him to answer. What Prof. Mukherjee is saying supports my case for a holdiay from patents.

Mr. Chairman: If he supports, you take it. The answer is already given.

Dr. S. L. Mukherjee: Taking a holiday from patents will be thwarting the inventions, and I personally do not like it.

Shri Arjun Arora: May I refer you to page 2 of your original memorandum submitted in January wherein you have thought of some payments commensurate with the value of the inventions. How do you compute the value of inventions? I mean the fourth line from the bottom.

Shri S. V. Divecha: We have stated in the memorandum that the royalty should be comensurate with the value of the invention. There are several cases laid down on the aspect of determining the compensation of royalty payable to a patentee in the case of a compulsory licence, and this subject may run through a lot of time. Briefly, there are certain factors which are taken into consideration: one is the expenditure incurred by the patentee and the time during which the patent has been in force, and secondly, the importance of the invention and the commercial utility. These are some of the factors which the Controller takes into consideration.

Shri Arjun Arora: Does the industry also do the same?

Shri S. V. Divecha: This matter arises before the Controller and the Industry pursues it so that the industry also does in the same way.

Shri Arjun Arora: I may now refer to page 7 of the same memorandum where you deal with a case of basic drugs and products. You say that the cost of basic drugs is usally higher in India than in other developed contries and the cost of finished preparations is in most cases much less than the domestic prices of similar products in foreign countries. How does the industry in India achieve this miraele? Is it by adding some more sugar?

Shri Modi: It was already discussed this morning. Sales promotion expenses in India are eight to nine per cent compared to 25 per cent in other countries.

Shri Arjun Arora: It is said that though the basic drugs are costlier in India, the finished products are cheaper than in other countries. Is it by merely having lesser expenses on sales promotion?

Shri S. V. Divecha: May I invite the attention of the hon. Members to appendix II of our supplementary memorandum which explains in detail the reasons why the cost of basic drugs is high in India?

Shri Arjun Arora: How do you achieve this miracle of making these finished products cheaper?

Dr. M. M. S. Siddhu: The question is, how are you able to bring out this miracle, namely, while the cost of basic drugs is high, the retail price paid by the customer, is cheaper.

Mr. J. Reece: The process is quite simple. In the first instance, the cost of the active ingredient is normally a small part of the total cost of the drug, and we have in the supplementary memorandum quoted the cost penicillin where the active ingredient is four per cent of the cost of the drug and the drug is sold to the consumer at 62 per cent. So, even if you double the penicillin cost, you are not substantially adding to the total cost of the drug. If you go through the whole list of drugs, you will find they are generally cheaper in India than in other countries. I am relying entirely on the report of the Development Council 1962-63. After making a thorough study, they say that ingredients and packing material account for 40 per cent of the cost; promotion expenses come 9 per cent but it is undoubtedly higher in other countries. Administration and distribution cost come to

15 per cent; again they are higher in other countries. Profit they have given as 16 per cent and possibly it is higher in other countries. The retailer's margin in India is given as 20 per cent, but to my knowledge no chemist in England takes less than 33-1|3 per cent and in Germany they take over 40 per cent. In these various ways the elements of the costs are lower here, than in other countries.

The statements that the pharmaceutical industry is making 900 per cent profit and so on arise from the simple misconception whereby somebody takes the price of the actual active ingredients and compares it with the price which the customer pays. They forget everything in between.

Shri Arjun Arora: Your objection to clause 5 is that it is discriminatory in character because in respect of medicine the patent can be only for the process and not for the substance. Will you be satisfied if this condition is applied to all industries and not merely to drugs?

Shri S. V. Divecha: If we get the same treatment as other industries, we are satisfied.

Shri Arjun Arora: If others do not get it and you also do not get it, will you be satisfied?

Mr. Chairman: It is a hypothetical question.

Shri Arjun Arora: We have given them 10 years and others 14 years. If we say it will be 10 years for everybody will they be satisfied?

Dr. H. R. Nanji: We have said that we would prefer to have 14 years. But if the committee says it is impossible, as a very poor alternative we would agree to have 10 years provided we have a provision for extension.

Shri Arjun Arora: There are so many opinions about the date from which this period of 10 years or 14 years should be counted. What is your view?

Dr. H. R. Nanji: There is an indefinite period between the application for a patent and the grant of a patent. To do away with this indefiniteness, it would be better if the period is counted from the date of the grant of the patent.

Shri Arjun Arora: Do you want the period of 10 years to begin from the date the patent is granted in India or from the date on which the patent is granted anywhere in the world?

Mr. Chairman: We are only concerned with our patenets; the question is not relevant and I rule it out. I rule it out of order.

Shri Arjun Arora: I want my question to be noted. My question is this. Do the witnesses agree that the patent protection should begin from the date on which patents for a particular process or product is granted anywhere in the world?

Shri R. P. Sinha: How is it possible....

Mr. Chairman: They are not concerned with anywhere in the world. You ask whether you want it from the date of application or the date of sealing.

Shri Arjun Arora: I will not ask what you want to ask; that you can do yourself better than I do. I am asking you to revise your ruling. Let me put my case like this. Supposing a particular product is patented in England in the year 1960 and its patent is likely to expire there in England (*Interruption*). It appears people have got their firm opinion in the matter. I have my own opinion.

Mr. Chairman: We do not object to your forming your own opinion. I have ruled out your question. If you want to put any other question you may do so.

Shri Arjun Arora: If you do not want me to proceed, I will go out. I have finished. I walk out in protest.

Mr. Chairman: I have given you more than an hour. We wanted to continue with these gentlemen only for half-an-hour. The other witnesses are waiting.

(Shri Arjun Arora then left the Committee Room).

Shri A. T. Sarma: Why is it that the prices in India are higher than those in Pakistan as far as medicines are concerned?

Shri Modi: It would be difficult for us to answer. Unless we know all the conditions in Pakistan, the customs duties there, whether the licences are free, whether packing matrial is allowed to be imported and so on, we will not be able to answer.

Shri A. T. Sarma: Medicine is the product of the work of expert scientists. Therefore, it is expected to be true and everlasting. Why is it that medicine loses its efficacy or popularity within, say, ten years?

Shri Modi: It is a question of advancement. New drugs are coming in and there is improvement.

Mr. J. Reece: The hon. Member is right that science is a search for truth, but we have not reached the ultimate truth in the field of medicine as yet and we are still searching for the final truth.

Shri A. T. Sarma: Therefore, do you agree that these are not final products of science?

Mr. J. Reece: There will be improvement on almost all drugs available today. But they are the best available today.

Shri A. T. Sarma: Do you conduct research work on indigenous drugs?

Dr. S. L. Mukherjee: A lot of Indian pharmaceutical manufacturers carry on research work on Indian drugs. To my knowledge, CIBA is doing very extensive research work Bengal chemicals and others are also doing a certain amount of research work on indigenous drugs.

Shri A. T. Sarma: A number of Indian drugs have been incorporated in the British pharmacopoeia. Do you want that they should be patented in India?

Shri Modi: I do not think that all the drugs in a pharmacopoeia are necessarily patented drugs.

Shri A. T. Sarma: The Bengal Chemicals have produced certain drugs but they have not patented them. Should they not do so?

Shri Modi: In this country, so far we have taken product and process patent, not process *per se* patent. The method of extracting the ingredients are there. Therefore, those products may not be patented.

Dr. S. L. Mukherjee: Besides, Indian drugs are known and associated with therapeutic drugs. We are only developing. If through our own research we find out something like Reserpin from *sarpagandha*, certainly that has to be patented, and people have taken patents for such things.

Dr. H. K. Nanji: It is not only that research is done in a number of laboratories on vegetable drugs, but a number of our members have started having extensive cultivation of vegetable drugs.

Shri R. P. Sinha: Kindly refer to Appendix I of your Supplementary Memorandum which deals with production of basic drugs in the year 1964. The popular feeling in this Committee, and outside also, is that we are not manufacturing all the drugs, particularly from the basic stage, that we use in India. You have mentioned some of the basic drugs

that are being manufactured in India. This would give an idea whether all our requirements of basic drugs are being manufactured in India. They have also given us their chart where they show the production of drugs in this country. The production has been steadily increasing and we appreciate that. The point is whether we are making all the drugs that we require in this country. We are told that there are 900 drugs in use. What percentage of that is being manufactured in India and what percentage is being imported? Secondly, we are told that the drugs that are being manufactured in India are from an advanced stage and not from the basic stage. Our companies, particularly foreign firms, are only packing, tableting and processing the formulations for actual doses. So, what are your plans for manufacturing medicines in this country? There is another related question. We are told that most of you have got a large number of patents in your names in this country but you are working only on a few of them. There are cases where out of 70 or 60 patents taken only 2 or 3 are being worked. Therefore, the allegation is that you are taking the protection of our patent laws to import products and not to manufacture them here.

Dr. H. R. Nanji: First of all, the cost of import of drugs for the last three or four years is of the order of Rs. 9 crores and the total quantum of production of pharmaceuticals in India is roughly of the order of Rs. 140 crores. So, it is not at all correct to say that a large portion is imported.

Shri R. P. Sinha: Rs. 175 crores includes your processing cost which is very much higher than the cost of active ingredients. So, the point that is urged is that what all the pharmaceutical companies are doing is importing basic drugs, formulating them, making them into tablets, packing them and selling them. Therefore, we are interested in seeing that these drugs are manufactured in India. A chart has been circulated to us by the Lok Sabha Secretariat which gives the number of drugs that are being imported and the number of drugs that are being manufactured in India. Why is it that so many drugs are being imported instead of being manufactured here?

Mr. J. Reece: The answer to this question is the industrial licensing provision. You cannot just decide to manufacture a drug here. You have to submit your application to the DGTD, the Ministry of Industry. Then they will make enquiries whether we have the capacity to do this, to do that and so on and so forth. We cannot just simply manufacture a drug in India. There are many reasons known to them why drugs cannot and are not manufactured in India.

Shri R. P. Sinha: The Health Ministry comes and tells us in the Committee that these gentlemen are not manufacturing these drugs even though they have the patent rights for them. So unless in respect of each item you say why you could not manufacture them here, this prejudice cannot be removed from our minds. Secondly, how many of these items are patented and how many not patented? We are told by other witnesses that unless we weaken the patent law it will not be possible for India to manufacture them. Suppose we weaken or abrogate the patent law, is it possible to manufacture all the drugs in India?

Mr. J. Reece: My answer to that would be "no". Merely having access to the actual patent is no guarantee that one can manufacture the product.

Shri R. P. Sinha: Why are you not manufacturing them?

Mr. J. Reece: We are manufacturing as many drugs as we are being allowed to. I hope, we would be allowed to manufacture them.

Shri R. P. Sinha: How many of them are you not being allowed to manufacture?

Mr. J. Reece: I cannot give that information.

Shri R. P. Sinha: Will you send us a complete note on this subject?

Mr. Chairman: Are there drug control or any other restrictions because of which you cannot manufacture them?

Mr. J. Reece: There are two large factories coming up—one in Rishikesh and another in Hyderabad—in the Government sector and no licences are being given for the drugs that are proposed to be made in those factories.

Mr. Chairman: We have another set of witnesses who have made their air bookings for the return journey. So, we wil' break here. We will try to finish the other party and then call you at about 5 o'clock. We may have to sit up to 8 o'clock; otherwise, you will have to come again some other day.

Dr. H. R. Nanji: We are prepared to sit and finish it today.

Mr. Chairman: Then, please wait for about half an hour.

(The witnesses were asked to withdraw and to wait)

II. Indian Chemical Manufacturers' Association, Bombay

Spokesmen:

(1) Shri J. H. Doshi

(2) Shri P. D. Nargolwala

(3) Dr. K. Subramanyam.

(The witnesses were called in and they took their seats).

Mr. Chairman: Gentlemen, the evidence that you give is public. It will be printed and distributed to all the members of the Committee and of Parliament. Even if you want any particular portion to be treated as confidential, it will be printed and given to our Members.

We have received your memorandum and it has been circulated to all the Members. If you want to stress any point or want to make out any new point, you may do so; otherwise, our Members may ask you some questions.

Shri J. H. Doshi: We do not have to make any new point beyond what we have mentioned in our memorandum. We are happy at the contents of the draft Bill because in broad outline it covered all the points that we had made out in our old memorandum presented in 1963 after Justice Ayyangar's Report. We had at that time made out three broad points, namely, that the life of the patent should be only ten years, that only the process should be patented and not the product and that compulsory licensing should be made much easier. All the three points are covered by this Bill.

We have also in the present memorandum covered some of the other clauses, ten or twelve of them, and have given our comments. It is only a question of amending them except one clause whose deletion we have suggested—I think, that is clause 87—because it is already covered by clauses 86 and 88, particularly by clause 86.

If any hon. Member wants further explanation of any of our comments or wants to put us a question, we are ready to answer.

Shrimati Sharda Mukerjee: One of the points you have stressed is that the life of patents should be ten years and one of the things that have been brought up here is that the life of the patent should be extended because the cost of research etc. is so heavy that it would not pay otherwise. What is your reaction to that?

Shri J. H. Doshi: We have said that ten years should be from the

date of sealing of the patent and not from the date of acceptance of specifications. We think that the present progress of technology is so fast and the period of obsolescence so short that ten years is a sufficiently long time.

Mr. Chairman: For other than foods and drugs, it is 14 years.

Shri J. H. Doshi: You have mentioned 14 years.

Mr. Chairman: You have no objection to that?

Shri J. H. Doshi: We have not commented on that. Ours is a chemical manufacturers association. We have commented on the section pertaining to foods, drugs, pharmaceuticals and chemical processes. 14 years period applies to engineering goods on which we have not commented.

Shrimati Sharda Mukerjee: What do you mean by saying that compulsory licensing should be made easier?

Shri J. H. Doshi: That is covered here. We had mentioned it in our Memorandum submitted in 1963 and all the three points which we covered then are covered in the present draft Bill. In between, there were suggestions about complete abrogation of patents. The Cabinet Sub-Committee suggested 7 years. Finally, your draft Bill has come back to the terms suggested by us. So, we can rightly take pride in this matter that you have accepted our suggestions.

Shrimati Sharda Mukerjee: Do you think we have the necessary technological and industrial base to even manage without the assistance of these big people who come here?

Shri J. H. Doshi: I do not think it in any way prevents any manufacturer from coming here. On the other hand, the idea is to force them to start manufacturing here. If that purpose of the Bill is served, this question does not need to be answered.

Shrimati Sharda Mukerjee: Supposing they get better terms outside, do you think this will deter them from coming here?

Shri J. H. Doshi: I do not think any reputable manufacturer can ignore the market of a country like India.

Shri Sham Lal Saraf: For our chemicals and these drugs that you manufacture here, particularly that come under patents for which the validity period is being fixed, will it be possible for our country, with the talent that we have at our disposal, to go the whole hog with our manufacturing programme of producing new processes without taking into consideration what is happening elsewhere? Let me clarify it a little more. Knowing as we do that the know-how within the country is far far less than it is available elsewhere and, secondly, the capital is also needed to be imported into the country, keeping both these angles in view, do you consider that our patent system will be successful when in other countries, the validity period for a patent which is being fixed here is more than what is being envisaged in the Bill?

Shri J. H. Doshi: I have already answered this. I entirely agree with the hon. Member that our technology and know-how is not sufficiently progressed to do everything ourselves. We do need their assistance; we do need their help and we do need their know-how. But, as I said, the Bill is not of a preventive nature. The Bill suggests that the people who want to register their patents here should take early steps to start production of their products in this country.

Shri Sham Lal Saraf: You have not caught my point. My point is that the validity period of those very

patents registered elsewhere in the world is much more, that is, 14 years to 16 years or even a little more. Will it be a sufficient incentive for them to come and work in this country or to invest, if necessary, in the manufacture of chemicals and pharmaceuticals here?

Shri J. H. Doshi: For a while they may not come. But that is my opinion. As I said, how can a reputable manufacturer having a foothold in all the countries of the world afford to ignore a country like India?

Shri Sham Lal Saraf: That is again a matter of opinion. In actual practice, there are other considerations also. Anyway, I come to another question. There are different stages of research, the fundamental research, the basic research and the applied research. Are we fully equipped for it from technological point of view? Then, I will come to the point of view of management.

Shri J. H. Doshi: No.

Shri Sham Lal Saraf: In doing fundamental research in drugs, particularly the life-saving drugs, we know and we see that elsewhere in the world, in the bigger countries and industrialised countries, much more effort is put in in order to arrive at new inventions and new things that can be patented.

Shri J. H. Doshi: We are not equipped. In the research field we have not progressed in a comparable manner as the Western and highly industrialised countries have. We must admit that. Therefore, we want them to come here; we want them to put their industries here and to start the manufacture here. 10 years time is sufficiently long under the present conditions of rapid technological progress and the shorter period of obsolescence.

Shri Sham Lal Saraf: Don't you think these are two separate questions, one of the validity period of patent and the other of making it possible for them to manufacture drugs in this country? Can't there be other provisions introduced in the Bill that will enable us to get as much know-how as possible provided they get sufficient incentive to come with their know-how and also with their capital in case capital is needed?

Shri J. H. Doshi: There are other financial incentives which may be considered.

Shrimati Sharda Mukerjee: You mean royalty?

Shri J. H. Doshi: Royalty or tax relief or tax holiday or the guarantee against nationalisation.

Shri Sham Lal Saraf: So, it is conditional.

Shri J. H. Doshi: If the Committee feels that way, a provision for further extension of the patent life by another four years may be made at the discretion of the Registrar so that they always have a temptation that in case of necessity, the life of the patent will be extended by a further period of four years.

Shri Sham Lal Saraf: There is a network of research laboratories in the country known as national laboratories. The Drugs Research Laboratory has also been set up. May I know, firstly, as to what extent they have been able to make some progress particularly in the fundamental research and the basic research and, secondly, whether there is some proper link established between the research organisations and the manufacturing organisations so that we work out easily the actual manufacturing processes?

Shri J. H. Doshi: Much progress has not been achieved yet. It will take time. Research is a tradition. You have to build a tradition. You should make your chemist or scientist research-minded. They must be watchful. They must know how to

notice the effects of a certain reaction. Although a reaction may take place and they may not notice it. It requires time. As I said earlier, it is a matter of tradition which we have to build up gradually. It will take its own time.

Shri Sham Lal Saraf: My point was specific. There are the laboratories set up by the Government. I too had something to do with some laboratories.

Mr. Chairman: Is there any liaison?

Shri J. H. Doshi: I have not come to the second question.

Shri Sham Lal Saraf: The first question was whether the drug laboratories set up by Government have established some inventive processes.

Shri J. H. Doshi: They have established processes but have not achieved much progress. About the second question, the liaison between research laboratories and the industry is now being established. The process has just started in the beginning of this year when CSIR arranged a seminar or conference here in January. Liaison centres are being set up. A centre in Bombay between our Association and the CSIR has been set up. The chemists from CSIR come to Bombay and meet the members of our Association who are all industrialists and discuss the problems with them. This process has just commenced. Up till now, there was a barrier between the CSIR and the industry and there were a lot of hostilities, but now this barrier is gradually being broken up.

Shri Sham Lal Saraf: The proper link has yet to be established?

Shri J. H. Doshi: As I said, it is in the process of being established.

Shri Sham Lal Saraf: With regard to price factors, this morning we got certain papers in which certain things have been made out. The prices at which drugs and chemicals are available in this country are lower, in most of the cases, when compared to the prices of drugs in America or the United Kingdom. But when compared to Pakistan, our prices are higher. Your Association being such a prominent Association, some of your manufacturers might have their branches in Pakistan also. Is ICI a member of your Association?

Shri J. H. Doshi: Some of the sections of the ICI are our members.

Shri Sham Lal Saraf: Could you throw some light to enlighten us as to why there is such a gap between the prices in this country and those in Pakistan?

Shri J. H. Doshi: That is a question which requires investigation. But I agree that the prices in U.K., United States and some other countries are even higher—I am referring to drugs—than the prices in this country. At the same time in other countries they are lower also. That depends on the patent position. In countries like Italy, the prices of some items may be higher and those of others may be lower. There are a number of factors affecting the price structure.

Shri Sham Lal Saraf: My question is specific. Some members of your association have manufacturing organisations in Pakistan also. Could you tell us, if not now, at least some time later, why the prices in Pakistan are lower—and in certain cases much lower—than our prices?

Shri J. H. Doshi: Will it be possible for you to name the product? We do not think that the ICI have any manufacturing unit in Pakistan to the best of our information.

Shri Sham Lal Saraf: Some of the firms like Hoechst may have..

Mr. Chairman: There are so many factors—tax structure, restrictions, etc. They have no idea.

Shri Sham Lal Saraf: Some of their members have branches in Pakistan also. So let them find out. They will be helping the Committee by that way.

Shri J. H. Doshi: I can find out if names of same products are given to us.

Mr. Chairman: You can find out why the costs of drugs in Pakistan are cheaper than in Irdia.

Shri K. V. Venkatachalam: Here is a statement giving the comparative prices in India and Pakistan. It contains a number of drugs. You can select half a dozen from that list and find out.

Shri J. H. Doshi: It is understandable because Pakistan has no drugs industry. They are importing from all countries of the world. In any importing country, the price structure is lower than that in the country where it is manufactured. Since we started manufacturing, our economy has become an expensive economy, a high cost economy. When we were importing, our price structure was also lower than at present because we could import from Italy, Japan, etc.

Shri Borkar: This list contains some drugs which are imported in India also. The ICI imports them here. There should be some parity in prices.

Shri J. H. Doshi: If it is a comparison of only imported products, the prices should be comparable.

Shri Sham Lal Saraf: We cannot say from the list what is imported and what is not.

Shri J. H. Doshi: We shall find out.

Shri Sham Lal Saraf: It will help the Committee if the hon. witness would kindly get us this information.

Mr. Chairman: You have a copy of the list You may get us the information if you can.

Shri Kashi Ram Gupta: In the previous Act there was a time limit for sealing, *i.e.*, from the date of application to the date of sealing, the maximum limit was 2 years and 3 months. The present Bill has not got such a provision. Are you of the opinion that there must be a provision, as was there in the previous Act, limiting the time of sealing from the date of application to the sealing of the patent.

Shri J. H. Doshi: It is desirable to have such a ceiling.

Shri Kashi Ram Gupta: I wanted your opinion. There is no provision in the present Bill.

Shri J. H. Doshi: I say that it is desirable to have a provision.

Shri Kashi Ram Gupta: The present Bill provides for a maximum of 4 per cent or royalty. Are you agreeable to this?

Shri J. H. Doshi: We have not commented on that, but we think that is should be more flexible. It is 4 per cent free of tax, which normally would come to 8 per cent.

Shri K. V. Venkatachalam: Not tax free. It is 4 per cent subject to tax.

Shri J. H. Doshi: Although we have not commented on this, we believe that it should be more flexible with a certain ceiling. We may put a ceiling of 8 per cent. But it should be fixed by the Registrar or the Government of India depending on the utility of the product. But we should not fix a certain percentage.

Shri Kashi Ram Gupta: When you say 8 per cent you want a maximum of 8 per cent?

Shri J. H. Doshi: Yes, subject to tax.

Shri Kashi Ram Gupta: The legislation can be only upto 8 per cent Is that your idea?

Shri J. H. Doshi: It can be 4 per cent or 5 per cent or 6 per cent, but upto 8 per cent.

Dr. M. M. S. Siddhu: What is the position of our country in regard to the production of basic fine chemicals? How much progress we have achieved and what are the likely prospects because if there is any hardship, the foreign collaborators may not be forthcoming and we may be isolated.

Shri J. H. Doshi: I do not think that we have made much progress in basic fine chemicals.

Dr. M. M. S. Siddhu: In that case, how are you going to base our chemical industry?

Shri J. H. Doshi: We have to import it for the time being.

Dr. M. M. S. Siddhu: What do lou think should be done for a fine chemical in our country?

Shri J. H. Doshi: So many schemes have been thought of and promoted, but unfortunately progress has not been achieved. For instance, take the Hindustan Organic Chemicals; even the base of buildings have not come up; it is a government-sponsored project.

Shri Bade: You have said that clause 87 should be deleted. This has been put in looking to the peculiar circumstances in the country. Clause 86 says that the Central Government will apply to the Controller three years after the sealing of a patent to have the compulsory licences. If you say that clause 87 should be deleted, you do not make a difference between patent in the drugs and medicines and patent of other things. Am I right?

Shri J. H. Doshi: The answer is this. This clause says that the Controller shall grant permission to any person to work the invention. It means that the Controller has no option. He has to grant permission whether the person asking for compulsory licence is qualified technically or financially for it or not.....

Shri Bade: My point is that there is a difference between clauses 86 and 87. Under clause 86 the Central Government will move the Controller three years after the sealing. Under clause 87 those patentees regarding drugs and medicines will be deemed to be licencess of right as soon as they apply. We do not want the foreigners who have the monopoly in these things to take advantage of our poor people.

Shri J. H. Doshi: As far as Government is concerned, they have the power under other sections too. As far as private parties are concerned, they have to wait for three years. You must give some protection to the patentee. After all three years is not a long time. Even otherwise without the know-how it is very difficult to manufacture it.

Shri Bade: Those who have already got it should continue. According to clause 87 they will be deemed to be licensees of right.

Shri J. H. Doshi: They must have been already working for three years.

Shri Bade: Sometimes they may not.

Shri J. H. Doshi: Three years time is reasonable.

Shri Bade: Not that Government should apply to the Controller every time.

Shri J. H. Doshi: Otherwise we shall be washing out the purpose of the Bill. Clause 87 is as good as abrogation. We have tried to compromise so that we do not earn a bad name in the country. If you put in clause 87, it is as good as abrogation.

Shri Bade: There is no royalty.

Shri J. H. Doshi: 87 does not cover royalty. 88 covers royalty.

Shri Bade: If you read 88, you will see that four percent royalty will be given. In 86 Government will apply to the Controller.

Shri J. H. Doshi: Clause 87 is as good as abrogation. It can be slightly amended. But we are definitely against 87.

श्री चोरड़िया : पेटेंट की अवधि कम रहे यह जो सुझाव है यह इसलिए दिया गया प्रतीत होता है कि ताकि दूसरे लोग भी उन चीज़ों को बना सकें इमीटेट कर सकें । आप देखें कि बहुत सीमैडीसिस ऐसी हैं जिनका पेटेंट पीरियड समाप्त हो चुका है किन्तु हमारे निर्माता लोग उनका निर्माण अभी तक भी नहीं कर पाए हैं । अगर पेटेंट की विधि कम रहेगी तो उसका फल यह होगा कि एक तो वे लोग रिसर्च पर अधिक खर्च नहीं कर सकेंगे और दूसरी ओर हमारे यहां के निर्माता उनका निर्माण नहीं कर पायेंगे । ऐसी अवस्था में जो बीमार लोग हैं उनकी जो स्थिति है उसका हल किस प्रकार निकल सकता है ?

Shri J. H. Doshi: I won't be able to reply in Hindi, though I have understood the question. If they do not start manufacturing here, we have to import them for our sick people. Imports are not forbidden. If we are not able to manufacture it till the valid period is over, we will have to import.

Shri V. M. Chordia: In India many medicines are not manufactured even though their ten year period is over. This will hamper the research. How will you balance the two? They do not have the know-how.

Shri J. H. Doshi: Know-how is quite another thing. Process is different from know-how. After the expiration of the patent you may have the process, but not the know-how. We are seeking collaboration for the know-how even for designs and processes which have expired 25 or 30 years ago. We can never believe that after the expiry of ten years we will be able to make everything. We will have to develop our know-how in every case. Till such time we will have to import.

Shri V. M. Chordia: How will you encourage people who want to do research?

Shri J. H. Doshi: There are other incentives. For instance, tax relief.

Shri V. M. Chordia: Tax relief is already given.

Shri J. H. Doshi: That is nominal. It is nothing substantial.

Mr. Chairman: After the patent lapses, anybody is free to develop know-how?

Shri J. H. Doshi: Developing know-how is different. Anybody can have the process. How to convert the process into a commercial product? That is know-how. It takes years.

Mr. Chairman: It has not happened?

Shri J. H. Doshi: Even in respect of processes which have expired 25 years ago we are not able to reproduce in our pilot plants. That is something different.

Shri B. K. Das: You say that clause 48 gives the Government unlimited powers, without processes of law or due compensation. How do you like it to be improved?

Shri J. H. Doshi: The Association suggest that Government should resort to this caluse only in those cases where the patent is not worked out in this country to manufacture drugs in sufficient quantity to meet the requirements of the country and at reasonable prices.

Shri B. K. Das: In clause 48, it is provided that Government may import for its own use in case there is

an epidemic as well as for defence purposes.

Shri J. H. Doshi: For defence and for epidemic, we have no objection. We have made exceptions too. Under normal conditions, unless the party holding the patent is not prepared to manufacture and sell at reasonable prices and to meet the requirements, the Government should not start importing them. By so doing that it will be cheaper, you will be killing all the incentives to manufacturers to come here.

Shri B. K. Das: Then, under what circumstances Government can utilise that power?

Shri J. H. Doshi: For defence and epidemic cases only. Or under such circumstances if it is being produced but cannot be stepped up quickly, then they can import.

Shri B. K. Das: Speaking about compensation, should it not be given? Here compensation is not provided for.

Shri J. H. Doshi: In that case too, compensation should be given to the patentee. That is in case of defence and epidemics too.

Shri B. K. Das: In all such cases, if it is for government's use, compensation ought to be provided for?

Shri J. H. Doshi: Yes, Sir.

Shri B. K. Das: Can you give me any idea as to on what basis compensation is to be paid?

Shri J. H. Doshi: I think it is 4 per cent free of income tax. But, now, as the wording goes, that excludes all taxes current in the country. If it is 4 per cent subject to taxes, then our limit for that is 8 per cent.

Shri B. K. Das: You will be satisfied if 8 per cent compensation is provided for.

Shri J H. Doshi: Yes, Sir.

(*The witnesses then withdrew and the representatives of the Organization of Pharmaceutical Producers of India, Bombay were called in again.*).

(*These witnesses reappeared and they took their seats*).

Shri R. P. Sinha: The point is that I have not got the answers to my question which I put to the witness before. I made a point that there are a number of companies holding a large number of patents and that they are not making use of them. Now, I have got a note prepared by the Ministry and got it circulated to all of us. It says:

The products for which the processes are patented and are being exploited in India are only a few as mentioned below; they are a large number in the list. I may read only one or two.

CIBA:

This firm is holding a large number of patents in India but to the best of our knowledge, they are manufacturing some harmones and some sulpha drugs.

GLAXO:

This firm is also holding a large number of patents in India. But, to the best of our knowledge, they are exploiting only one or two Vitamin tablets. (A)

Hoechst:

This firm's representative is also here; they are holding many patents in India but are exploiting only one. They are doing Tolbutamide.

Parke Davis:

This is a wellknown American firm holding a large number of patents but are exploiting only a few. They are manufacturing Tetracycline.

May & Baker:

They are holding several patents but are manufacturing only chloroprocaine and some sulpha drugs.

Merck Sharp:

This firm is holding a number of patents in India but they are manufacutring only Vitamin B-12.

There is another American Company which is holding 93 patents. They are manufacturing only a few. Like this, there are a number of companies having a number of patents but they are manufacturing only three or four. The note further says that there are a number of companies mentioned therein with and without foreign collaboration who are manufacturing 1,933 pharmaceutical formulas under their own registered proprietory trade names. These foreign companies in India and the foreign firms abroad are surely holding innumerable patents for various specific products and processes. To the best of our information, all of them are having patented formulas in India. This is a very serious charge against the pharmaceutical industry in India. Although you said that their production has increased from ten to twenty fold, we are told that they are not producing the basic things. This is number 1.

Charge Number (2) is that you are holding a large number of patents here but exploiting a few. Therefore, if we weaken the Patent Law, probably others will also exploit them or you will be compelled to take them up.

Dr. H. R. Nanji: The first question I would like to ask the Health Ministry is: certain targets have been fixed by the Development Council for the Fourth Plan and how many of these patented drugs are included for manufacture in that Plan? We have got the targets ready for the Fourth Plan and we would like to know as to how many are included there. If they are not included, that means that their demand is very small and nobody would like to produce them.

Shri R. P. Sinha: You are putting a question to a question. That is not a correct reply. Our minds will not be properly changed on that basis. You have got to explain this point, these allegations against the pharmaceutical industry in India.

Dr. H. R. Nanji: We shall send you a detailed reply after taking into consideration all these points. But we cannot give the answer here.

Shri R. P. Sinha: I want this answer. This is a point which has not been covered in your two memoranda. You have said very general things in your memoranda.

Dr. H. R. Nanji: This also we would like to know—it is said that many firms are holding so many patents which they are not exploiting. Who are they? We would like to have this information from Govt. records.

Shri R. P. Sinha: Is it not a fact that CIBA is holding so many patents? How many patents they are holding and how many they are exploiting and how many they are not exploiting? If not, why?

Mr. J. Reece: The charge that my company manufactures only two products and imports the other patented products is not correct. Some of these, *viz.*, cortisone, hydrocortisone, Plednisolone acetate, etc. are manufactured. Secondly the manufacture of a product depends upon its demand in the country. The charge that we are holding back their manufacture in this country for reasons best known to ourselves is not a valid charge. That is why I would welcome an opportunity and I am sure every company would welcome the opportunity to take this statement and give full details.

Shri K. V. Venkatachalam: I think if you could put the question differently they will be able to answer.

Mr. J. Reece: May I say that the implication against my company that we are importing all our drugs is not correct. Our import Bill comes to

only 7% of the materials used and most of our raw materials are available here.

Shri K. V. Venkatachalam: If patented drugs are imported and are not manufactured in this country, why should they not be manufactured in the country? They are manufacturing certain drugs in this country and certain drugs are also imported in the finished form. Why are the latter not being manufactured in this country?

Dr. H. R. Nanji: The list you have given us is a long list. The first observation I would like to make is: it does not give a complete picture for this reason. Quite a number of items included in this list have recently been licensed by the Government for manufacture in this country. In some cases applications for licences are pending before the Government and I will read out those from this list.

Erythromycin—licence is pending for the last 2 years. Insulin is already being manufactured by Boots. Tolbutamide-Hoescht has got a licence and their capacity is 40 tonnes. There is not the slightest need for importing this small quantity. The quantity imported is 1½ tonnes. They can very well make that quantity. They made only 12 tonnes.

Shri K. V. Venkatachalam: Why have they not made more?

Dr. H. R. Nanji: There are limitations of import licence in certain cases. That is why it is not manufactured upto the licensed capacity.

Then we go to Chlorpropamide—Pfizer have already set up a factory and they will be soon going into production.

Lastly Chlorpromazine—May & Baker has been licensed and they are going to manufacture this drug. I think in fairness this allegation is not correct.

Mr. Chairman: You may give a statement giving the true facts and it will be circulated to our members.

Dr. H. R. Nanji: We will send a detailed note.

Phenyl Butazone—Suhrid Geigy has got a licence.

The second point is: the items included in this list are all items, the demand for which is very small and no manufacturer would think of going into production of small quantities.

Shri Bade: Why do you hold thousands of patents and thereby block the way of others?

Dr. H. R. Nanji: Anybody can ask for compulsory licence. The original charge was that these are being imported and not being manufactured here. Regarding that we shall send you a detailed statement giving the exact position and I would also sugest that you may verify what we say from the D.G.T.D.

Shri R. P. Sinha: What about other companies—Hoescht and Merck Sharp & Dohme?

Mr. Keith C. Roy: The position as regards Merck Sharp & Dohme is—although it does not appear on the list there—in so far as our manufacturing capacity of Vitamin B12 is concerned, we were licensed under the Industries (Development and Regulation) Act to manufacture 30 kg per year which were the full requirements of the country as determined in consultation with the then Development Wing. The target for the Fourth Five Year Plan has been put at 60 kg and we have an application pending with the Ministry of Industry for over 2 years, requesting that we may be allowed to increase our capacity to meet this requirement. As of to-day, no orders have been passed on that case.

In so far as other patents which we hold are concerned, the position is, as Dr. Nanji has indicated, that it is not correct to say that we are blocking the progress of others who wish to exploit those patents. As we have tried to show in the case of process patents you have necessarily, as the law now stands, to take a number of processes and patent them; and out of them perhaps one or two processes may prove to be commercially exploitable. The other processes which are indeed covered by patents are not exploited commercially because they are not economic processes. But, as we have stated, there is nothing whatever to prevent any other person coming and applying for a compulsory licence for those processes and exploiting them, processes which we consider to be uneconomic.

Shri R. P. Sinha: How many of the patents that you are holding are being commercially exploited and how many are not exploited and why they are not being exploited?

Mr. Keith C. Roy: I regret I can't give you that answer straightway. I will certainly obtain it and send it to you.

Shri S. V. Divecha: So far as my company is concerned, we don't hold any patents in India, but our foreign collaborators are holding some patents in India. I don't have any details as to the number of patents which they hold in India and the number they work. I shall try to find that out from them, but in so far as my company is concerned, I can say that we are manufacturing four patented products in our factory in Greater Bombay.

Shri R. P. Sinha: Regarding the statement about this Rs. 9 crore worth of imports that you are making of the basic drugs, will it be possible for you to give us an idea about your plans for making them in India and about what is standing in your way, whether it is due to Government regulations or that they are required in very small quantities?

Dr. H. R. Nanji: Quite a large proportion of this Rs. 9 crores is made up of intermediates which are required for the manufacture of drugs and these intermediates at present could not be manufactured in India because the basic chemical industry does not exist. We still don't have even a simple thing like phenol. We had been promised that the Hindustan Organic Chemicals will go into production five years ago. It still has not started making a single product and that is the reason why we are obliged to import this quantum of Rs. 9 crores. But there has been a constant reduction in the quantum of imports during the last ten years.

Shri R. P. Sinha: I draw your attention to your supplementary memorandum dealing with porfitability. I also draw your attention to another note which I got sent this morning by the Lok Sabha Secretariat to you, in which a statement showing the remittances of profits made by certain pharmaceutical companies during the period April 1963 to March 1966 is given. The names of the different companies are also given. It is very difficult for me now to find out as to how these figures of remittances are to be related either to your net worth or to the capital employed by these companies. Now, in order to find out whether these companies are making unreasonably high profits or they are making reasonable profits, I must relate them to the percentage of your capital employed or your net worth. Will you help me in furnishing the figures for the companies mentioned in this statement so that I might arrive at correct figures?

Mr. Keith C. Roy: Mr. Chairman and Hon'ble Members, these figures were mentioned to me very informally and naturally I have not got all the data here with me, but I can say quite categorically that in respect of Merck, Sharpe and Dohme, the figures shown are totally incorrect.

Shri R. P. Sinha: Are you aware that these figures have been given by the Reserve Bank?

Mr. Keith C. Roy: No, Sir.

Shri R. P. Sinha: If you refer to the first page, you will find that they have been given by the Reserve Bank.

Mr. Keith C. Roy: May I first of all make a statement that in respect of Merck, Sharpe & Dohme, these figures are absolutely incorrect? Whether they have been furnished by the Reserve Bank or not, I can't say but it is stated here....

Shri R. P. Sinha: Can you give me the correct figures?

Mr. Keith C. Roy: Yes, Sir. First of all, if I may take, as I can only take, the case of my own firm, Merck, Sharpe and Dohme, it says that in 1963 the remittances was 71,209 dollars. Now the first point is I don't know to what period in 1963 the figure relates. Is it the calendar year 1963 or is it the financial year ending 1963? In fact, in the case of my company, it happens that our financial year ends in November and, therefore, it is very difficult for me to say to what exact period these figures relate.

Shri R. P. Sinha: I can only give the figures of remittances furnished by the Reserve Bank. I didn't look into the company's figures. This relates to actual remittances in 1963..

Mr. Keith C. Roy: Yes, Sir, I have tried to check the figures on that basis and, therefore, as regards the figure entered in this statement for 1963, I have assumed that, since our accounting year ends in November 1962, this figure of 1963 in the Reserve Bank statement must relate to the dividend which we remitted for the year ending November 1962, which would be sometime during the year 1963. The figure for 1963 in the statement is shown as $ 71,209. In fact, Sir, our remittance for that year was $ 40,840. The figure, of course, was converted at the old rate of one dollar-Rs. 4.76. I take the figure of 1964 in which the remittance in the Reserve Bank statement is shown as $ 147,724. I am presuming that this relates to the remittance for our year ending November 1963. The dividend which we remitted was $ 96,429. Then, Sir, the figure for 1965, which again I presume relates to the dividend which we declared for the year ended November 1964, is shown in this statement as $ 322,431, whereas in fact, it was $ 77,143. I would say with respect, Sir, that these figures are totally incorrect. I would also like to make it clear that although in this case, the Reserve Bank states that they have no information regarding the amounts paid to foreign firms under other heads of accounts, namely, royalty and technical know-how, in the case of my company, there can be no doubt whatever that about any other figures being mixed up within these figures, because Merck in India does not pay any amount of royalty, or fees of any other kind to Merck & Company in the United States.

Shri R. P. Sinha: What about Glaxo? Maximum remittance is for Glaxo.

Shri Keith C. Roy: Yes, Sir. I do not know whether these figures are correct or not.

Shri R. P. Sinha: What is the suggestion of the leader of the witnesses? Will he throw some light on it.

Dr. H. R. Nanji: We will check up the accuracy of these figures and give you the true picture very shortly.

Shri Keith C. Roy: May I just try to answer the Hon'ble Member's

question in regard to the request which he made for assistance in trying to elucidate some of the figures which were set out in the Reserve Bank bulletin. I have, Sir, made a fairly close study of the figures both in the November, 1964, and the November 1965 bulletins which contain certain figures relating to the pharmaceutical, chemical and other chemical industries. I would like to state that, first of all, the figures in the 1964 bulletin which relate solely to the chemical industry are quite incomprehensible even to a reasonably intelligent person, if I may say so. Unfortunately, Sir, there are, as I said this morning, three basic concepts against which we must attempt to measure the financial stability of a company. One is the paid up capital, which means the equity capital; the preference capital and any banks shares that might have been issued. The second concept is the net worth of a company. The net worth of a company is a concept of the paid up capital plus reserves plus the surpluses which come forward each year from the profit and loss account. The third concept is the concept of total capital employed. The total capital employed is the paid up capital as in the first instance, plus reserves and the surpluses as in the second definition plus all the provisions for taxation and borrowings. In fact, Sir, the concept of capital employed is the concept of the total monies used in a business, whether they come from the capital raised or whether they come from borrowings. Now, Sir, if I may take one minute of your time and come to the article in the November, 1964, issue, they have used a concept of total capital employed. Now this I have discussed with one of the Deputy Governors of the Reserve Bank and he has clearly admitted to us—my colleague Dr. Nanji was present at that time—that they have not included reserves and borrowings in the concept of total capital employed. Therefore, Sir, when they arrived, in the November 1964 issue, at a figure of 23% as representing the gross profits as a percentage of the total capital employed, they have related that gross profit to a figure which is not a correct concept of the total capital employed. The second point I would like to make, Sir, is this. That in the 1965 issue of Reserve Bank of India Bulletin, strangely enough, there is no figure at all of total capital employed. Yet the same article does produce a percentage, in the same way as the 1964 issue did, of gross profits as a percentage of total capital employed. But no figure of total capital employed has been given in the article. But with all those limitations, Sir, the figure which emerges from the 1965 issue of gross profits as a percentage of total capital employed is only 13·7% against the 23% taken in 1964 bulletin. My submission, Sir, on these figures, is that they have no relevance as reflecting the true state of the industry as a whole. With those limitations, Sir, I still feel that perhaps I can help the Hon'ble Member in arriving at some view as to where the industry stands in regard to certain basic concepts. In this case, I am referring to the article in the November, 1965 Bulletin, recognising the limitations of the definition which have been given.

Table 3 on pages 1694-1695 of the 1965 issue, compares the status of the industrial group called "Medicines and pharmaceutical preparations" in relation to 28 other industrial groups. This is, in fact, an overall survey of 1,333 companies taken by the Reserve Bank; and, out of the figures that emerge from that examination, they have arrived at figures which they call the national average. If I could take two minutes more and then I will finish, I will try to give you some idea of where the pharmaceutical industry stands in this matter. I will just read the relevant figures from Tables 3 and 4 of that article.

The dividends expressed as a percentage of profits before tax in the pharmaceutical industry is 17·2% against the national average of 29·9%. The profits retained in the business, as a percentage of profits before tax, are 20·6% in the case of pharmaceutical industry against the national average of 18·8. In other words, the pharmaceutical industry is ploughing back into the industry more than the national average. The dividends paid as a percentage of profits.... The dividends paid as a percentage of profits after tax is 45.5 per cent against the national average of 61.15 per cent. Again, the dividend distribution is appreciably below the national average, which again reflects itself in the ploughing back of profits into the industry. I would then pass on to Table 4 and give what we consider to be the three main criteria. Now, I have mentioned that net worth is the total capital *plus* reserves *plus* surpluses. The profits after tax as a percentage of Net worth in the pharmaceutical industry would come to 12.7 against the national average of 9.32. That is to say, Sir, in the pharmaceutical industry the profits expressed on that basis are somewhat higher than the national average. But I would ask you to bear in mind, Sir, that at the present moment the borrowing rates from any commercial bank are something of the order of 8 to 10 per cent. Dividends expressed as a percentage of net worth, which again is an important indicator, are in the case of pharmaceutical industry 5.8 per cent, against the national average of 5.7 per cent. Again dividends as percentage of paid-up-capital are in the case of pharmaceutical industry 10.4 per cent against the national average of 10.3 per cent. So keeping in view the limitations to which in our submission, the Reserve Bank bulletine figures are subject, I would suggest that the position of the industry as regards its profiitability, its dividend, and its retention of profits within the industry compares favourably with the national average figures. And if I can help the hon. Members further in interpreting these figures, I shall only be too happy to do so.

Shri R. P. Sinha: Sir, I am grateful to the hon. witness for the explanation he has given. I wish Mr. Misra would have been here, as he would have benefited; he is also an economist. I wanted to put a few questions in respect of research. Now, so far as basic research is concerned, only one company, *i.e.* CIBA in the private sector, is doing that. In the public sector some basic research is also being done by Pimpri. Now the complaint, Sir, is this that although, as is evident from the figures given by the learned witness himself the profitability figure in the pharmaceutical industry is higher than the general average of proitability in other industries, The pharmaceutical industry is not investing enough moneys in the basic research in this country. What they are doing, as they have themselves explained, is the formulation of a development process research. What we are anxious about in this committee is that in India we should develop basic research. Now I would like to know that although we had this patent law which is quite favourable—as they themselves say that the present law is preferable to the Bill as now before us—is it that your companies have not set up the basic research work in this country? Have you got any of developing basic research in this country? And if so, will that be affected by this present law?

Dr. H. R. Nanji: So far we have not been able to undertake basic research. The quantum is comparatively small. But there are certain fundamental limiting factors which have led to the situation. First of all, as Dr. Mukerjee has indicated, a worthwhile research unit requires a capital investment of something of the order of Rs. 60 lakhs and a recurring expenditure of Rs. 30 lakhs. Secondly, there is the absence in this country of a sound technological base of

organic chemical industry, pero-chemical industry and fermentation chemical industry. These three have not developed and these are absolutely essential for undertaking basic research. Thirdly, research is directly linked with the production. We have given you figures of production in the U.S.A. and other countries and also in India. Production in the USA is of the order of Rs. 1,645 crores per annum; production in India, as you know already, is of the order of Rs. 140-150 crores. Sir, I am quite certain that as time goes on, as production develops, as the technological base of chemical, petro and fermentation industries is built up, basic research definitely will be undertaken in this country, and I am quite certain that in the next ten years we shall see a very substantial improvement of this industry.

Shri R. P. Sinha: But I understand from Dr. Govindachari that basic drugs require chemical research and clinical testing. And clinical testing both at his institute, CIBA institute, and that at the ICSR and other places takes about 6, 7 or 8 years. Now, if this is the position, how to reconcile by having a lower period of the patent and at the same time develop basic research in this country? Now, the difficulty in my mind is this. If we reduce the period of a patent, it will affect, as explained by Dr. Govindachari, the development of basic research. Will you give your idea in this matter?

Dr. H. R. Nanji: I have been a member of the Executive Committee of the National Drug Research Laboratory in Lucknow for some years and this deficiency of clinical facilities in the country has been felt repeatedly in the last three or four years. I must say that the situation has considerably improved and it is hoped that further improvement will take place in the next two or three years, because special attention is being given to this question of cilinical testing. At present, facilities are not adequate. Therefore, it takes a long time.

Shri R. P. Sinha: I would now like to go to clauses. I would like you to tell what is your objection to clause 87(1) (licences). There are cases going on for 4, 5 or 6 years and the big companies which you represent are harrassing the people who want compulsory licence in such a manner that they cannot make use of the provisions of the compulsory licences. This has come to us as evidence. Could you tell us to ensure that you do not permit such a thing happen, i.e. when a compulsory licence is granted a man make use of it and not go into ruination on account of litigation as is being done at the present moment?

Shri S. V. Divecha: Sir, in so far as the Compulsory Licensing provisions are concerned it has been complained that the obligations or the grant of Compulsory Licences causes lot of delay. It is for this specific reason that we have submitted our amendment to clause 87(i) wherein we have specifically provided that Controller should decide the case in three months and the Appeal will also be disposed of in three months.

Shri R. P. Sinha: How can we give this direction to the High Court. Is it possible to give direction to the High Court?

Shri S. V. Divecha: As regards the Appeal against the order of the Controller the Tribunal could be directed by the Act itself to decide the Appeal.

Shri R. P. Sinha: And suppose the Tribunal does not dispose of the case what will happen? I have not seen any such piece of legislation where the time limit is put on the Supreme Court or High Court.

Shri S. V. Divecha: We have suggested a Tribunal.

Shri R. P. Sinha: Now we would like to ask from you there is lot of

complain and very correctly that the advertisement costs in this country are heavy. Now is it possible to reduce the cost of the medicines if they reduce the promotion expenses and advertisement expenses?

Dr. J. Reece: I would submit if the cost on advertising—which is already very modest—is reduced it is very likely to make the drug more expensive for the simple reason that higher volume of production brings lower costs and 7 to 9 per cent is not a large figure and if it is reduced and the drug does not sell, the volume falls down below an economic level and the cost must go up.

Dr. M. M. S. Siddhu: New processes for anti-T.B. and anti-malarial drugs discovered in India were referred to by Dr. Mukherjee. May I know which processes have been used by any other firms who are manufacturing any of these drugs.

Dr. S. L. Mukherjee: It is a personal question which relates to me and I beg indulgence of the member to give a personal answer. I was previously attached with M|s. Albert Davis Ltd. where for my patented process of INH and others, I was personally following the basic production.

Dr. M. M. S. Siddhu: Is any other firm using those processes in India?

Dr. S. L. Mukherjee: Yes. What I was telling was that while in Albert Davis Ltd. I was using those processes for basic production. They were following the processes that I patented when I was there.

Dr. M. M. S. Siddhu: Is it process patented or Product patented?

Dr. S. L. Mukherjee: It is a process patented. We were the first to introduce Talbutamide before even the Hoechst came into the picture.

Dr. M. M. S. Siddhu: Supposing Albert Davis do not allow and we have to go on without that process what will be the result?

Dr. S. L. Mukherjee: I am a joint holder of the patent and I have received no notice from them so far and have left them in 1959. I am not aware of what is the situation here?

Dr. M. M. S. Siddhu: My second point is that much has been said about the need to approach the doctors for the new drugs and if the doctors are not approached the drugs would not sell. The prices will go up. But here is a sample of the literature which is meant only for doctors. Now see the contents. How much information does it contain? Are they only meant for having a look and then be thrown in the waste paper basket? If that amounts to sales promotion and on which large sums are being spent where is the need for such advertisement. This sort of literature which is neither informative nor contains the details. It contains some indications. How anything spent on these can be termed as a means of communication to the doctors.

Further from my personal knowledge I have come to know that the administrative charges on the personnel promotion that is on the representative visiting the doctor is about 1 to 1½ per cent. I am trying to break-up 8 per cent. 1 to 1.5 per cent are the charges on the representative who sees the doctor the rest of it is merely on sampling and literature.

Mr. J. Reece: First of all, when we talk about medical information for the doctor, there is still something more to be supplied to him than these mailings. The medical information that we have to present to the doctor, when we introduce a new product, is exhaustive and detailed and supported by clinical evidence and backed up by formal opinion with the medical reports, and most of the expenditure on sales promotion goes on the introduction of a new product.

I would ask the Members merely to cast their minds over what they

would do if they had to introduce a new drugs, as I had mentioned this morning, a new cure for cancer, to the doctors of India and to get it used quickly.

The second point which the hon. Member has made is quite right. He makes a very good point when he asks what the use is of sending him this literature which merely gives him a few details about the product. Those of us in the pharmaceutical industry, on whom this responsibility lies are quite certain that no doctor would consider prescribing a new product as a result of seeing only a brief statement of the action and advantages. We know that. But, on the other hand, he might be sufficiently interested to seek further information on that product.

If I may submit something which has just occurred to me this morning, here is the booklet on the Indian pharmaceutical industry published by the Govt. of India which if left on your desk you would probably open and look at; after seeing the nice attractive cover, you would probably open and see it, the attractive cover would encourage you to look and see it. This cover, therefore, is worth its weight in gold, because if we do not look into a book we shall never know what is inside it, but if there is a nice cover for the book, we would be tempted to look inside. This is why we are trying to make our literature attractive to the medical profession.

I might mention another point and that is this. This question could be dealt with very effectively by quoting the example of the Soviet Union where under their system of medicine they do not have this type of promotional exercise; and the exact quotations unfortunately I do not have with me just now, but I shall be very happy to supply them. There, the Ministry of Health was bemoaning the fact that their doctors were not using new products and they were actually suggesting that the Ministry of Health should send out more attractive information to doctors to get them to use the new products. Also, they were suggesting that qualified pharmacists should call on the doctors and call on the health centres to tell them about the new products. So, if you do not do it this way, then somebody has got to do it.

Finally, I would like to make one further submission on two more important points. The pharmaceutical companies themselves are anxious to avoid making a bad impression on the doctor or unjustifiable claims, because if they do so they will only damage their own reputation, and the doctor will not accept that company as a proper company in the future.

In the UK, there is an open invitation to the doctors to be taken off the mailing list, but only a minor percentage of them have asked us to take them off the mailing list. I would be quite prepared to supply the hon. Member the figures, because I am sure, and I am quite certain, from my own personal experience, that the cost of medical representation is not as high as the cost on promotional expenditure in our country today.

Dr. M. M. S. Siddhu: I would very much like to receive those figures, because I find that it is about 7 or 8 per cent or more in the case of firms whose balance-sheet is made available to the public. I am saying this, because I am not conversant with the position of those whose accounts are not made public. This question had come up recently in a conference of medical representatives, which I had inaugurated at Allahabad. It was from the medical representatives themselves who were asking for higher wages that this point had cone up. It is more or less from the employees of the pharmaceutical industry that I have got this information. So, I am letting it out to you.

Mr. J. Reece: Thank you very much.

Dr. M. M. S. Siddhu: The other point that comes up in the price structure is the processing cost, which is very high. If that be the sole factor, then in the case of the new drug whose ingredient may be just a very small portion, a few milligrammes or perhaps 0.5 gms. the cost will be very high because largely it is the processing cost only.

How is it that the processing cost cannot be reduced? If that is reduced, then more money will be available for research, and you may not have to say that it is a blind man's approach, because you have to screen thousands of compounds out of which only one may be commercially useful.

Therefore, I would like to know whether the processing cost can be reduced to such an extent that one would be able to supplement the research with the money saved on it.

Mr. J. Reece: The fact of the matter is that new drugs are usually comparatively highly priced, and by 'highly priced' I mean highly priced in relation to other drugs. Our new drugs are very complex things, and they cost quite a lot to produce; quite apart from any money that you may spend on research to discover the new drugs, the cost of the whole equipment and the whole complex technique or process of producing them is very high.

In the pharmaceutical industry where we are competing vigorously with each other not only in price but by product-substitution. this is the safeguard that if allowed to its full range it will ensure that the patient will get the drug at the most economical price.

Every effort is made in striving to reduce the costs of production, because we want to try to get a larger market for our product against either some other therapy or some other company with a similar product; for, as you know in the case of the pyramid, if we price a drug at Rs. 100, only a few people can take it; if we take the cost down to Rs. 50, then more people can take it; if we take it down to one rupee, then millions can take it, and there are millions who will take it, the lower the cost; so, the lower the cost, the greater the off-take and the more it raises the prosperity of the particular company. Let me assure you that every effort is made in a competitive situation to reduce process costs. But new drugs are expensive and new drugs are difficult to make.

Dr. M. M. S. Siddhu: I would like to refer you to the interlocking system which has been brought out by these administered prices, where a particular firm which has got a patent right allows some one to manufacture it but does not allow that firm to market it; by 'marketing' I mean the processing; they will be ab'e to sell the bulk to X, and X will market it. By this method, they are able to keep up high prices. Through this interlocking system of buying from one company and selling it to the other, it has been found, that they make very high profits running up to a huge percentage. Another case is that of Pfizer, reported in the Sunday Times, of buying from a firm in Hungary and making a profit of 1,000 per cent. Here, it is not the processing, it is the bulk supply, and therefore that point that it is out of the processed product is being compared with bulk rate is not quite correct. It is abuse of a patent, that is all I say.

Mr. J. Reece: The on'y thing I can say is that this is not the general way the industry as a whole goes about this type of thing.

Dr. H. R. Nanji: If I may add, so far as this country is concerned, if there are any such instances, Government have got adequate powers to investigate.

Dr. M. M. S. Siddhu: Neither the doctors who prescribe know it nor the patients who buy such medicines, whether they are costly or cheap the

patient has to buy them, otherwise he has to leave the doctor. Therefore the patient is in a very bad situation.

Mr. J. Reece: Even in the cases you mention, the companies themselves operating within a total orbit do not make vast and enormous profits. The net result is something which the American Anti-Trust Department considers reasonable and the patient must be in good hands when he is in the hands of a doctor both from his treatment point of view and his economic point of view. Amongst other things I would like to submit that we must also not lose sight of the fact of the value to humanity that these drugs have brought about, because, in the final analysis, while people formerly had died or had to undergo long an expensive treatment, are now being cured. Unfortunately mankind has been able to solve our problems in the wrong order, namely disease first and then population control. This is the tragedy of mankind if I may say so If we had discovered the solutions in the other order, first population control and then eradication of diseases, we would not be in such a position.

Dr. M. M. S. Siddhu: It is contended that most of the drugs coming in the market are likely to go out of the market in a short time because of improved drugs taking their place. In order to cover their cost, they have to keep the price high. If that is so then a ten year period is more than sufficient because 90 per cent of them will go out of the market within that time. Those that stay on will be because of the reputation of the firms behind them. And the doctors, having once got the habit of prescribing a particular drug by its trade name, I am sure, would go on writing the same thing even after ten years if that drug is worthwhile to be used.

Mr. J. Reece: That is correct. The doctor, even though you may present him with something which is obviously better, will not accept it immediately. The point about risk is this. If I am putting up a plant for a particular compound, I have to invest my money, my time, talent everything in that plant, and the fact of the matter is that it is quite likely that somebody else will come along with an improved product and my plant will be useless. This is what is meant by risk. When you go into the pharmaceutical industry, you are exposing yourself to very great risks because somebody else maycome up with something better. Even with a marginally better product, he has simply to get the doctors to prescribe it. So, for new products for the high rate of promotional activity they do, they have to get returns.

Dr. M. M. S. Siddhu: Certain drugs which have been proved to be useless clinically for certain diseases are still being advertised and doctors approached. Comparative data on medical research done all over the world is available and articles appear once in three years or so, but that is not advertised, nor is it mentioned anywhere that particular drugs have become useless. Therefore, through your literature you not only propagate certain things, but you are actually misleading the public.

Mr. J. Reece: I wish it were as easy as all that. We do not and we never deliberate set about to mislead anybody, because it is not in the interests of the industry. If we do not write, somebody else will. That is competition.

Shri Bade: You have objected to Clause 48 along with Clause 95(3). Coming to Clauses 84 to 90, suppose there are certain patentees from foreign countries coming here and taking out patents, but not manufacturing the drugs here, should the Government take any steps against them or not?

Shri S. V. Divecha: In sof ar as Clause 48 is concerned, we have already made our submission.

In so far as this is concerned, we feel that firstly there are ample provisions under the Act for securing against the abuse of a patent right. These provisions are contained in the provisions regarding compulsory licence under clause 84.

Also, under clauses 99 and 100 of the Bill, the Government can make use of an invention which will also include, in my opinion, importing of patented products from abroad. Our submission is that there are ample provisions in the other clauses of the Bill for making use of the invention for the purpose of the Government. Clause 48 does not provide for any appeal or judicial review or any fair or adequate compensation. Neither does it give an opportunity to the patentee to be heard.

Shri Bade: We have the same provisions in the Act of Japan..

Shri S. V. Divecha: There is no such provision which the hon. Member is referring to, in the Japanese, legislation. The laws of Japan only provide for a compulsory licence where the patentee does not work an invention in the country.

Shri Bade: We have seen that there are so many companies which take patents and they are not manufacturing the drugs here. They are only importing the medicines from outside and thus they deprive our scientists and our country of indigenous research work. In order to mitigate it, do you feel that we should have provision in the Act?

Shri S. V. Divecha: We do have such a provision in the Act clause 84.

Shri Bade: It only refers to compulsory licence.

Shri S. V. Divecha: For non-working also.

Shri Bade: The Government would apply to the Controller and the Controller will say that it is compulsory licence and that is after three years after sealing.

Shri S. V. Divecha: In so far as food and drugs are concerned, in our amendment we have suggested that the application can be made at any time after the sealing of the patent.

Shri Bade: Clause 48; this is only for Government use.

Shri S. V. Divecha: We have special objection to that clause, because it is widely and vaguely drafted. Secondly, it is completely redundant, because clauses 99 and 100 provide ample means to the Government to do what they want to do. What we are mainly objecting to is that any person should not be authorised by the Government to import the article from non-patented sources and to distribute it as he pleases. There is no provision regarding compensation and no appeal or reference to the high court.

Shri Bade: Is there such a provision in the patent law of other countries?

Shri S. V. Divecha: No other patent law in the world contains such a provision.

Shri B. K. Das: How is it that it affects fundamental rights? Is there any rule or authoritative opinion about that?

Shri S. V. Divecha: Our organisation has taken legal opinion, and we have been advised that some of the provisions of the Bill are such—

Shri B. K. Das: About clause 48, at page 3 of your original memorandum, you have said that this clause militates against fundamental rights of the citizen of India which have always been held as sacred to this country and to democracy. I was asking whether you have consulted legal opinion and whether you were advised like that.

Dr. H. R. Nanji: We have taken legal opinion on that.

Mr. J. Reece: I shall explain it. The situation is that a patent is not always a product, and out of the many patents registered, only one or two products come along. (As a *quid pro quo*, immediately, the benefits of research done by other countries they are made available to us straightaway. The problem with the "Government" clause in pure and simple terms is this: if it is left wide open for Government under any circumstances to bring any drug from any other source at any price it chooses, you will be bitting at the very essence of the pharmaceutical industry in India, because the definition about the Government use is so wide to enable any interpretation to be put on it. The circumstances should only be emergent circumstances.

Shri Bade: All the processes are blocked out, and if research is done in America, what is the use of our scientists? Our scientists cannot take advantage of any process because all processes are locked up.

Mr. J. Reece: They can. We can apply for compulsory licence tomorrow. About 700 drugs are not even patented but are not made in India. There must be capital, technology and the willingness to take risks.

Shri Bade: From 1911 to 1965, nobody has taken the advantage of compulsory licence, simply because the procedure is long. We are cutting it short. The present Bill will mend the whole thing, but in the previous Act, the process was very long.

Now, the Haffkine institute has issued a memorandum which reads as follows *inter alia*:

"The following facts throw interesting light on this issue. Hoechst had taken out patent in many countries of the world including Japan, for their processes described in Ind. Pat. No. 58716. They claim that the process patented by Haffkine Institute *vide* Ind. Pat. 64323 is already covered by Hoechst Pat. (I, P. 58716). However, one month after Haffkine Institute filed their patent in India, Farbwerke Hoechst applied in Japan (and possibly in other countries also) for an additional patent, covering the manufacture of Tolbutamide by process similar to that of Haffkine Institute. If their contention that the process of Haffkine Intitute is already covered by them is valid, then that or similar process would not be novel or new and as such could not be subject matter of further patent.

Another interesting fact is that the Hoechst patent in Canada for Tolbutamide (same as Indian Patent No. 58716) was challenged in the court of law and was revoked on grounds such as (i) too wide a claim, (ii) covering more than what the inventor invented, (iii) not a manner of new manufacture, (iv) no utility is not all the products produced by the process have utility as claimed etc."

So, Haffkine Institute says that it was patented and then it was challenged in the high court in Canada. The case was lost. If such a thing happens, we must plug the loophole.

Shri S. V. Divecha: So far as Hoechst and Haffkine are concerned, the Hoechst patent has a priory date of 8th May, 1956. In that they have claimed several processes for the manufacture of new sulphonylureas. The Haffkine Institute, probably after examining the patent specification of Hoechst, invented a so-called invention for the process to manufacture the same kind of sulphonylure as which process was disclosed some years ago in the chemical literature. Therefore, we have been advised and it is our confirmed opinion that the patent of Haffkine Institute is completely dependent on the patent of Hoechst. The carrying out of the process described in the Haffkine patent would infringe the patent of Hoechst. This matter is *sub judice* and I shall

prepare a detailed note and I can give it to you.

Dr. M. M. S. Siddhu: Is it a fact that the same process was got patented in Japan after their original one?

Shri S. V. Divecha: In so far as this matter is concerned, we have to obtain the details from the patentee himself. I did not know that this question would be asked, and it relates to something—

Shri Bade: I am also a lowyer; that is *sub judice*. But this subjcct is not *sub judice*, that is, whether you have lost the case in Canada.

Shri S. V. Divecha: So far as Canada is concerned, this is the first time I hear about it. We shall obtain detailed information and I shall certainly be pleased to give it to the Committee.

Shri R. P. Sinha: The Haffkine Institute have shown that they could produce the medicine at one-fourth the price.

Shri Bade: For six years the case is pending, because everytime they are taking adjournments.

Shri S. V. Divecha: Adjournments have been taken sometimes by us and sometimes by the other side also. In fact, Haffkine Institute is not a party to the suit.

Shri Bade: I know.

I have a booklet where it is said:

"As stated in the USA Senate Report No. 448, 'even under liberal interpretation of research allowed by the internal revenue survey research costs of the 20 major drug Companies represents only 6:4 per cent of the total sales dollar.'

The said Senate Report states:

"India, which does grant patents on drug products, provides an interesting case example. The prices in India for the broad-spectrum antibiotics Aureomycin and Achromycin are among the highest in the world. As a matter of fact in drugs generally, India ranks amongst the highest priced nations of the world—a case of an inverse relationship between per capita-income and the level of drug prices.

Tolbutamide costs only $1:85 for 50 tablets in many European countries, but in India it costs $3·57. Chloropamide costs only $1·41 in Italy, but $4 in India and so on. So, this is the general criticism that the patent-holders have created a monopoly. In your memorandum, there is no specific reply to this critcism.

Shri Keith C. Roy: I think that booklet has not brought out clearly enough the total results of the Kefauver hearings. The total result of the two years of the Kefauver hearings were two small amendments to the Patents Act which had no impact whatever on the operation of the Act. In so far as this famous statement is concerned, I have made a detailed study of the price—factors on which it is based. It is fair and proper that the Hon. Members of this Committee should know what are the basic facts on which this statement has been made. The Kefauver Committee asked the Department of State to collect price data on a certain number of products in different countries. The State Department supplied a very great deal of data and, out of that, the Kefauver Committee took only 12 basic ingredients which were being sold and manufactured in various countries other than the US. In so far as India was concerned, out of the 11 tables in which this information was set out, India was mentioned in only 6 of them. Regarding the statement that the prices of aureomycin and achromycin are highest in India it is correct so far as aereomycin is concerned. It is not correct in so far as achromycin is concerned. The price structure of four other products in regard to India was correctly given.

Shri Bade: Regarding achromycin, what is the correct position?

Shri Keith C. Roy: This is given at page 42, table 20 of Report No. 448—The Report of the Committee of the Judiciary, United States Senate made by a sub-committee on anti-trust and monopoly. The price of achromycin is shown as 128 in India and as 134 in Belgium. So, India is not the highest priced country. The price is expressed in terms of percentages, not in terms of actual money. So, *prima* facie the statement of Senator Kefauver about achromycin is incorrect.

Shrimati Sharda Mukerjee: I think your main objection is to the licence of right and royalty which is now fixed at 4 per cent maximum and which you consider is too low. I have before me some figures given on page 49 of your Supplementary Memorandum. You have given here the figures relating to sulpha drugs. The production in 1964 was 252·94 tonnes and in 1965-66 it has gone up to 1274 tonnes. Could you tell us what is the imported content in this, what percentage of it is imported?

Dr. H. R. Nanji: I will not be able to give you the exact figures for sulpha drugs. Generally the import content has gone down over the years.

Shrimati Sharda Mukerjee: I have another list here, giving the figures mostly about mycin drugs, and I find that out of 24 drugs listed there only 5 of them have some indigenous content. These are all very important drugs. From the point of development of our industry we are interested to know what proportion of it is imported.

Dr. H. C. Nanji: We will be preparing a detailed note on this statement giving all the facts, indicating what drugs are already being licensed for manufacture and all that.

Shrimati Sharda Mukerjee: Could you not tell me at least approximately what quantity is produced indigenously and what quantity is imported?

Mr. J. Reece: We are collecting the data and it is being supplied.

Shrimati Mukerjee: The point that I am making is this. We have had an unpleasant experience recently when the Indo-Pakistan hostilties were on. At that time this particular industry was almost coming to a halt because so much of the material was being imported.

Shri Roy gave us some figures about profit retained, profit ploughed back and all that. If the import content is high and the imports are from your main companies abroad, then how much of the profits are ploughed back and how much of the profits are retained take a different shape altogether. It also contains the technological know-how fees. That also has to be taken into consideration. If the thing is processed here and research is carried on here due to which the import content over the years has been reduced, then the profits retained, profits ploughed back, the shape of the capital and all that sort of thing would have a different meaning. It is really not to create any insecurity among the people who come from outside and invest in our country that we are doing this, it is because we wish to give a better opportunity to the people of this country to use and exploit their ability and the raw materials that are available here. It is from that point of view that you must look at this licensing of right. Over the years we find that there has been very little progress in this country as far as this industry is concerned.

Shri S. V. Divecha: In so far as the progress achieved by the industry is concerned, I would like to invite the hon. Member's attention to page (1) of our Supplementary

Memorandum, where we have given the figures of increase in production and saving in foreign exchange.

Mr. J. Reece: People are bringing their technology and their know-how to India willingly and building up the indigenous industry. We have seen large plants, large chemical plants being built in this country. The whole pharmaceutical industry is on an international basis. During the last trouble one of our great advantages was that we had a great deal of indigenous production within the country. This is going forward and it is going forward rapidly and we want it to go forward further. Once a technology is developed it will become self-generating. This is what is happening here. All industries are made to do more and more. But ultimately it will take time. The trouble with licence of right is, it does frighten people away. Licence of right is a frightening phrase. It has a certain connotation in many countries. We say, it is not necessary to put licence of right provision. Why frighten people away when the same protection is available within the law?

Shri B. K. Das: You say it is more a psychological thing.

Mr. J. Reece: Certainly. Licence of right has a connotation to everybody. It means something in other laws. If we put it in our law and however much try to qualify it, still it is there as licence of right.

Shrimati Sharda Mukerjee: In this eight year old report, Justice Ayyangar has mentioned that all other countries put this restriction of compulsory licensing. The only exception is U.S.A. which has a very different economy from ours. Our country requires a certain amount of protection and the Bill itself provides for a licence of right under certain conditions.

Mr. J. Reece: The intention of our Association was to present a compulsory licence clause. If that can be done, there is no need for licence of right. If there is no need, why should we put in a great barrier which otherwise is not there?

Shri Shyamnandan Mishra: I have been unfortunately mostly absent from the meeting. So, I do not know whether my questions have been already covered. Still, I would venture to ask two questions purely for the sake of clarification.

We are indeed very glad that this pharmaceutical industry has made tremendous progress in India. This is indeed a matter of great satisfaction. Yet one has a feeling that in the matter of research, we have to go a long way in this country in this field. It is also true that it is quite impossible for individual units to go in for any meaningful or significant research activity. It was mentioned in the forenoon that for any significant research activity a minimum amount of Rs. 30 lakhs would be required. That being so, naturally the question arises in our minds whether some kind of joint research programme could not be evolved and worked out by the pharmaceutical industry as a whole. We have got the example of A.T.I.R.A. and a similar one in Bombay so far as textile industry in India is concerned. The hon. gentleman on the other side knows that in the United Kingdom they have a joint research organisation for the steel industry, for example, B.I.S.R.A. That being so, would it not be quite proper for the pharmaceutical industry of this country to explore the possibility of having a joint research programme, or, have they already made some progress in that direction?

Mr. Chairman: The answer has come. They said they have not done that. They are thinking on that line.

Shri R. P. Sinha: They said they do not want joint venture.

Shri Shyamnandan Mishra: The financial contribution by Government for such research activity is quite significant. It is of the order of 50 per cent in the case of A.T.I.R.A.— 50 lakhs by the textile industry and 50 lakhs by the Government. If you do not want to avail of this opportunity, that means you want to depend on foreign patentee.

Mr. J. Reece: The reason why we do not want it is that we believe that we can do better research on our own because there will be an element of competition.

Shri Shyamnandan Mishra: The amount set apart is 3 per cent of the total turnover. In order to have 30 lakhs, there should be a turnover of 10 crores. When will that consummation take place and hownmany companies will come under this in India?

Dr. S. L. Mukherjee: I have explained to the hon. Members of this Committee that basic research can be done only by large companies. It will be futile to do scientific research in a basic way so far as small companies are concerned because the risks involved and the expenditure involved are too much. As you have rightly pointed out, only companies with a turnover of 10 crores and over can think of doing this. Today in India such companies are very few and those few are seriously thinking of doing this research.

Shri Shvamnandan Mishra: Only thinking of?

Dr. S. L. Mukherjee: They have already started doing. Ciba is doing; Alembic is doing and Sarabhai is playing a small part in it in a small way. For others it is a waste because unless you do it on a minimum scale, there will be no result forthcoming. The money we spend must be fruitful. That is the main aspect about it. Secondly, taking the lead of the hon. Member's idea on research in a meeting organised by the CSIR in Delhi in last December I had pointedly suggested that if Government could have a screening centre where we could give, without disclosing the identity but by paying whatever reasonable amount is required, that might lead to a solution. It is worth consideration by the Members of the Committee and the Government. Through the universities and various other sources and industries we could produce thousand of compounds a year without any difficulty. But there is no facility for screening.

Shri Shyamnandan Mishra: Alternatively, would it not be possible to have a kind of research levy from individual units which cannot do research and utilize that amount in research activity by Government.

Dr. S. L. Mukherjee: I already explained in the morning that the research for the development of new drugs requires tradition, requires culture and that if you analyse the discovery of new drugs you will find that 95 per cent of the drugs were discovered by the industry. I firmly believe that it is the industry which can deliver the result, not Government institutions.

Shri Shyamnandan Mishra: As it lies largely in the field of intangibles, I would not pursue this matter further. Should not the period of validity be governed by the speed with which technology is getting obsolete and the drugs are getting out of use in the modern world? If so, why should there be so much of insistence upon the period of patent validity being so long ?

Mr. J. Reece: The answer to your question is that, on the whole the trend of patent protection round the world is to extend the period of time for the life of the patent, because it is becoming more and more difficult to discover and develop drugs; and it is not a simple matter of discovering

something today; five years later it is going to be out of date. So, there is very good need for a good period of time, a good length of time for patent protection.

Shri Shyamnandan Mishra: Is there no consideration for the speed with which technology advances and the drugs become out of use? Should not that be the most important governing factor, so far as the period of patent validity is concerned?

Mr. J. Reece: When you take out a patent, somebody is going to compete with it after some time. Also even if we allow it to run for the full period, the law of diminishing returns sets in.

Shri K. V. Venkatachalam: Could you give us the figures of imported finished drugs? If, as you say, the production in India is of the order of Rs. 150 crores, which is a very sizable quantity, why do you not manufacture those drugs which are now being imported?

Mr. J. Reece: The demand for those medicines is so small that it is not worth putting up a plant.

Shri K. V. Venkatachalam: So, the large bulk of our requirements are made in this country now?

Dr. H. R. Nanji: Yes:

Dr. M. M. S. Siddhu: You have referred to the import of drugs worth only Rs. 9 crores as against the production of drugs worth Rs. 150 crores A lot of chemicals are imported and used by the pharmaceutical industry. So, what is the import content of these Chemicals.

Dr. H. R. Nanji: This Rs. 9 crores consists of intermediates and basic products; not chemicals.

Shri K. V. Venkatachalam: Could you give us an idea of the proportion of patented and non-patented drugs in India, firstly, in terms of number and, secondly, in terms of value of the end product?

Dr. H. R. Nanji: At the moment, we do not have those figures; we can supply them.

Mr. J. Reece: The portion of non-patented drugs is much higher than those of patented drugs.

Shri K. V. Venkatachalam: We would like to have precise information both in respect of value and number.

Shri S. V. Divecha: It is difficult to get that information. May I invite your attention to page 45 of our memorandum? We have actually conducted a sample survey on sale of pharmaceuticals containing patented ingredients.

Shri K. V. Venkatachalam: Supposing the total consumption is Rs. 200 crores. How much of it would be patented drugs?

Shri S. V. Divecha: The sample survey has revealed that the sale of patented drugs was approximately 32 per cent of the total sales. There again the definition of patented drugs has been rather wide in the sense that we have also included those drugs which are patented and which do not enjoy exclusive monopoly or exclusive right.

Dr. M. M. S. Siddhu: Suppose medicine ABC has got ingredient B alone patented and not A or B. Will you include it?

Mr. J. Reece: In certain cases we have. We are talking of patents in terms of monopoly. If you take Vitamin A and B complex, everybody is making it. There is no monopoly.

Dr. M. M. S. Siddhu: You cannot have a formulation ABC if C, which is patented, is not put into it to make the formulation. It is something like a filter, which is necessary for an engine. If you do not put the filter, you do not have the engine.

Mr. J. Reece: If I have got a patented drugs and nobody else has got it, I can do what I like. That is one type. The other type is that there is a product which anybody can market containing one or two patented drugs.

Shri S. V. Divecha: I would like to invite your attention to Appendix 6 and Appendix 7 of our Supplementary Memorandum which give classification of drugs in common use. We have indicated in the list drugs which are patented and those which are not patented.

Shri K. V. Venkatachalam: My last question is this. You were saying that the further development in the pharmaceutical industry at the intermediate and lower level will depend on the development of fine chemicals, fermentation and petrochemicals industries. What is the percentage of these industries? Have you taken any steps so far as this is concerned?

Dr. H. R. Nanji: Development of petro-chemicals industry does not come under the purview of the pharmaceutical industry. But there are big giants in the chemicals industry who are certainly going very fast ahead with the petro-chemicals industry and also with the fermentation industry.

Shri K. V. Venkatachalam: Will there be development in the next three or four years?

Dr. H. R. Nanji: Yes.

Shri K. V. Venkatachalam: What about fine chemicals?

Dr. H. R. Nanji: The Hindustan Organic Chemicals Factory is there.

Shri K. V. Venkatachalam: That has been there for several years. What is your expectation?

Dr. H. R. Nanji: The difficulty has been that for several years, applications from the private sector were turned down on the ground that the Hindustan Organic Chemicals will be manufacturing certain intermediates. Fortunately, this policy has been changed during the last two or three years and now licences are being granted for the manufacture of intermediates and chemicals which are required.

Mr. Chairman: You have told us only about yourself. What is the function of your Organisation?

Dr. H. R. Nanji: We shall send you the detailed booklet which gives all the details.

Mr. Chairman: Can youh give us the main objectives of your Organisation?

Dr. H. R. Nanji: The main objectives are to look after the interests of the members, to cooperate with the Government and, generally, to increase the standards of working of the industry.

Mr. Chairman: Is it a registered body?

Dr. H. R. Nanji: Yes, Sir.

Mr. Chairman: How long has it been registered?

Dr. H. R. Nanji: About a year ago.

Mr. Chairman: Only a year ago? Were you under any other name before?

Dr. H. R. Nanji: There was another association which had included not only manufacturers but also wholesalers and distributors. It was felt by many of us that it is absolutely essential to have a separate organisation of manufacturers only and that is why this organisation was started.

Mr. Chairman: Thank you.

Dr. H. R. Nanji: On behalf of my colleagues and myself, I should like to thank you for the courtesy you have extended to us and also for the patient hearing given to us. Thank you.

(The witnesses then withdrew)

The Committee then adjourned.

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965.

Friday, the 12th August, 1966 *at* 14.00 *hours.*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Seth Achal Singh.
3. Shri Bibhuti Mishra.
4. Shri P. C. Borooah.
5. Sardar Daljit Singh.
6. Shri Basanta Kumar Das.
7. Shri H. K. V. Gowdh.
8. Shri Mathew Maniyangadan.
9. Shri Braj Behari Mehrotra.
10. Shri Bibudhendra Mishra.
11. Shrimati Sharda Mukerjee.
12. Shri P. S. Naskar.
13. Shri Chhotubhai M. Patel.
14. Shri R. Ramanathan Chettiar.
15. Shri Sham Lal Saraf.
16. Shri A. T. Sarma.
17. Dr. C. B. Singh.
18. Shri K. K. Warior.

Rajya Sabha

19. Shri T. Chengalvaroyan.
20. Shri P. K. Kumaran.
21. Shri Shyamnandan Mishra.
22. Shri M. R. Shervani.
23. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*

3. Dr. A. Joga Rao, *Controller General of Patents, Designs and Trade Marks.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

LEGISLATIVE COUNSEL

Shri R. V. S. Peri Sastri, *Deputy Legislative Counsel, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Incorporated Law Society of Calcutta.

Spokesman:

Shri B. P. Ray

II. Council of Scientific and Industrial Research, New Delhi.

Spokesmen:

1. Dr. S. H. Zaheer, *Director General, C.S.I.R. and Ex-officio Secretary to the Government of India, Ministry of Education.*

2. Shri Baldev Singh, *Industrial Liaison and Extension Officer, Directorate of Research Co-ordination and Industrial Liaison, C.S.I.R.*

3. Shri R. B. Pai, *Patents Officer, C.S.I.R.*

I. Incorporated Law Society of Calcutta.

Spokesman:

Shri B. P. Ray.

(The witness was called in and he took his seat).

Mr. Chairman: Mr. Ray, whatever evidence you give will be printed and distributed to the members. It will be laid on the Table of the House. Even if you want any portion to be confidential, it will be printed and distributed to our members. We have received your memorandum. It has been circulated to all the members. If you want to add anything new or supplement it, you may kindly do so.

Shri B. P. Ray: Sir, I do not think that any part of my evidence given here need be treated as confidential. My main points concern Chapter XXI of the Patents Bill, incorporating therein clauses 125 to 132. I represent the Law Society of Calcutta. It is a Socity whose members are Solicitors enrolled in the High Court at Calcutta. There are many Solicitors as also Advocates who have been for years past practising as Patent Agents. I cannot say definitely, but from random samples taken of Advocates and Solicitors in Calcutta—specially my office where we have a number of them, it would not be incorrect to say that at least 75% of the Solicitors and Advocates on the roll of the Calcutta High Court do not possess a Degree in

Physical Sciences or Engineering. It is a common feature, Sir, that at that stage in their University career when they are permitted to opt for a specialized line, students who opt for a Science Degree or an Engineering Degree do not generally take a Law Degree thereafter. We, therefore, Sir, view with great alarm the formidable restriction included in sub-clause (c) of clause 126 of the Bill which seeks to make it law that a person shall not be qualified to have his name entered in the Register of Patent Agents unless he has obtained a degree in Physical Science or Engineering. I may be permitted to ask, Sir, what is the rationale or underlying principle of this requirement? In the Report of the Committee presided over by Hon. Mr. Justice Ayyangar it had been stated that in India there is no recognized organization or Institute of Patent Agents corresponding to the Chartered Institute of Patent Agents in the U.K., and from there it has been recommended in that report that certain classes of persons should only be registered as Patent Agents, and from the practical point of view each of those classes required the possession of a Degree in Physical Science or Engineering or equivalent scientific or technical qualification. In the first place, Sir, may I be permitted to ask what is really "physical science". It has not been defined in the Bill. I have myself looked into Webster's Dictionary and the Concise Oxford Dictionary, both under the entries "physical" and "science". But I have not found any clear definition given in those Dictionaries of those words in that combination, *viz.* "physical science". May I be permitted to ask what is a physical science? Is Botany, Geology, Biology or even Hygiene a branch of physical science and, if so, what will be the strict relevance of a degree in those subjects in the context.

Secondly, Sir, if I may be permitted to make a humble submission. I wish to state that a degree in physical science or engineering without adequate legal training cannot possibly equip a person to draft applications and documents which are necessary in connection with patent cases. The subject of patents, I submit, envisages the entire dominion of human invention. A degree in physics or chemistry or pharmaceutics will be of no particular use in a patent problem relating to engineering or *vice versa*. I, therefore, submit, Sir, unless a patent agent is expected to specialise in omniscience it is difficult for us to see how a degree in one of those science subjects will be of use in a problem arising from any of the other science subjects.

I then come to the difficulties from the practical point of view which particularly touches my profession. There are many solicitors practising as patent agents. My firm has been practising as such and advertising as such in the Law Directories and Law Journals for a long time and practically all over the world. Although the word 'advocate' has been used in clause 126 the words "solicitors and attorneys" have been omitted although these words occur in the Ayyanger Committee Report. We have already dealt with in our Memorandum as to the type of work a solicitor does and under English Law, as far as I know, solicitors are practising as patent agents although certain restrictions have been placed on the qualifications of patent agents. We, therefore, feel, Sir, that the words solicitors and attorneys" have been omitted from the Section without reason. Secondly I submit that there are many solicitors & advocates who have been practising as patent agents and the qualifying requirement of a science or engineering degree will throw them out of practice. This will cause, firstly, great hardship to the individuals concerned and, secondly, the value of the great experience built-up by them will not be available to the inventors. The problem of patent law is essentially a problem of law and the application of law as such is something in which lawyers are expected to be specialists.

Thirdly, Sir, if the Bill is passed in its present form, for years to come the practice of patent agents so far as lawyers are concerned will be turned over to persons who happen probably accidentally to have an engineering or a science degree. A lawyer and an engineering degree is, as far as I know, a rarity and this will tend to create, at least for years to come a monopoly which will be a monopoly of those lawyers only who happen to have a science degree and that does not necessarily mean that they are the best in the line or that it will provide the best assistance that an inventor could expect to obtain when he comes forward with a patent application. I also submit that this will deprive the Controller of assistance from experts at a time when such assistance is all the more needed having regard to the complications likely to arise from administering this Act which is new and much more comprehensive than the Act which is intended to be replaced. Our submission, therefore, Sir, is that the restriction should be removed altogether, at least it should not be brought into force unless an institute of patent agents has been established on the lines of the Chertered Institute in the U.K. It is felt that the restriction must be retained in the Act even now, the enforcement of that requirement could be postponed until such time as we were ready for it and it is not uncommon for different provisions of an Act to be brought into force at different times. These are the submissions which I wish to make.

Mr. Chairman: You have no objection if we make this applicable to future entrants and allow the existing solicitors and advocates practising to continue.

Shri B. P. Ray: That will meet my point to a large extent if the requirement of science degree is not imposed.

Mr. Chairman: Some technical knowledge for a patent advocate is necessary that is why probably that has been introduced.

Shri Sham Lal Saraf: As far as present practising advocates and solicitors are concerned, I think, our hon'ble friend has made a good case for them but what about future. At least somewhere it must stop.

Shri R. Ramanathan Chettiar: Excepting that you cannot appear for the purpose of specification you can appear for other purposes.

Shri B. P. Ray: That is true because clause 132 provides for that. But my submission is that a very important part of a patent lawyer's job is the specification and matters connected therewith and to take that work away from the practising advocates who have devoted their lifetime practice to it would be really robbing them partly of their living. It would also enhance costs in the sense that the administration of the law to that extent would become much more expensive because we will no longer have the benefit of the built-in experience of a large number of practitioners.

Shri R. Ramanathan Chettiar: Let me understand you clearly. Filing of specification is of technical nature. So it can only be done by the prospective pharmaceutical entrepreneur whosoever is putting up the industry or whosoever is incharge of the drug industry—I mean the legal aspect. So why do you think that filing of specification is a very important feature as far as the filing of the specification before the Controller is concerned.

Shri B. P. Ray: A patent application starts from the drafting of the specifications. A client comes to us. He may be an expert in that line as often as he is not. When he comes to us to draft specifications which comply with all the requirements of the law, he expects us to do so in such a way that there is no alteration or correction to be made. In other words, to draft specifications is a matter of art and it is more in line with a lawyer's

equipage than anything else. So far as technique is concerned, as I have told you, a mere science degree in physics will not help him when he touches a problem of chemistry, engineering and *vice versa*. As I just now said, no patent agent can be expected to specialise in omni-science. His knowledge will naturally be limited. It is in the field of the lawyer's activity. It is his educational training which probably enables him to do better than others namely, to frame documents which not only comply with the law but also with the above branch of law.

Dr. C. B. Singh: The idea is that we want the cadre of patents to be so adjusted that the work of patent law is better done. I hope you will agree that a graduate in science—whether it is physics or chemistry or engineering—will be a better patent agent than one who does not possess that. There are many advocates who are science graduates and there is no doubt about that. I think those who have not got the science qualificatioins must practise something else. Anyway don't you agree with me that a graduate in Science will be a better patent agent than anybody else?

Shri T. Chengalvaroyan: In cases of lawyers being patent agents, on questions which involve engineering or scientific aspects, do they not consult the specialists in that line and incorporate their view? I think that is the practice.

Mr. Chairman: That he has stated in his memorandum.

Shri B. P. Ray: I have stated in my memorandum as to how exactly a patent lawyer works. He is not expected to know all branches of inventions. But, then, he is suited to draft documents which really form the very basis of an application for patents. Whether he succeeds or fails is a matter of luck. It is easy for him to get proper asistance from technicians or scientists.

Shri P. S. Naskar: You referred to something that is obtaining in England. So far as patent agents are concerned, would you tell the Committee as to what qualifications are necessary for one to act as a patent agent under the English Law?

Shri B. P. Ray: If you will kindly refer to page 6 of my memorandum; I have stated that to become a patent agent, one should be a member of the Chartered Institute of Patent Agents.

Shri P. S. Naskar: I want to know as to what are the qualifications required to become a member of the Institute?

Shri B. P. Ray: I have dealt with this in the last para of my memorandum. If it is to be done in a phased manner, then we should prescribe the rules, syllabi, curricula and the qualifications to be attained by a person before he becomes a patent agent. It would be too early to impose this sort of a restriction viz., to become a graduate in physical science or engineering to be useful in any way.

Shri P. S. Naskar: We have to make some move in this respect. Till such time, you know, under the existing rules, anybody can be called a patent agent in India. I can even become a patent agent. We find that everybody is declaring himself to be a patent agent just for some consideration. And no qualification is necessary in India—I am, however, subject to correction—to-day for one to become a patent agent. Will you leave this matter as it is or do you want to keep the monopoly with the lawyers only?

Shri B. P. Ray: No, Sir. All that I wanted to say is this. We should build up experience in the practice of the Patent Law.

Shri P. S. Naskar: Do you agree that to be a patent agent, one must have more than legal qualifications?

Shri B. P. Ray: Yes, Sir. But, the thing is this. If you prescribe a particular course or if you establish an institute on the lines of the Chartered Institute of England I have no objection. Just as we become solicitors after our being with a Solicitor for five years in the same way the patent agents should become patent agents. There cannot be any objection to that. But, to substitute that by this shortcut method, if I may be permitted to use that word, will not serve the purpose.

Shri P. S. Naskar: This is a means to an end. It is not a shortcut method.

Shri B. P. Ray: I would submit most respectfully that at present this method will probably be more than counterbalanced by the harm which it will do to the patentee, to the administration and to the profession as also to the inventors.

Shri R. Ramanathan Chettiar: You say that it will do harm to the Administration. Would you kindly elaborate that point?

Shri B. P. Ray: The Administration will not have the benefit of the experience of all the lawyers who have been practising in that line and who do not possess a science degree.

Shri R. Ramanathan Chettiar: I hope you will agree with me that the present Patent Act is a very outmoded one having been passed in the British days in 1910. With the changing conditions of our economic as also the new developments in science, particularly in the pharmaceutical industry, don't you think that a lawyer patent agent, apart from his legal knowledge, should have some experience of scientific knowledge as well? That is why, as my hon. friend Shri Naskar put it correctly, it is a means to an end. I am only reiterating as to what my friend has said. We want a lawyer who has not only got the legal acumen but also a scientific knowledge to help the administration.

Shri B. P. Ray: If the scientific knowledge were properly channelled and a syllabus or curriculum were framed by which the adequacy of knowledge can be rightly measured, probably, I have no objection. But, before we have actually established an Institute of Pantent Agents on the lines in England, I suppose, this will not meet the purpose.

Dr. C. B. Singh: Don't you feel that we should maintain the qualifications which will be necessary for future courses especially for this type of work? That is a very important thing; we should have a cadre of specialists for this purpose. The time may come when it will be worthwhile to have this qualification for the patent agents.

Shri T. Chengalvaroyan: There is this practice now obtaining before the Income Tax Appellate Tribunal that lawyers as well as Auditors are allowed to appear. Suppose there is this alternative qualification of a patent agent being a solicitor and a scientific man, have you any objection to that?

Shri B. P. Ray: I have no objection at all because it is not my object at all to restrict Patent law practice to advocates and solicitors only.

(The witness then withdrew)

(Thereafter the representatives of the Council of Scientific and Industrial Research were called in).

II. Council of Scientific and Industrial Research, New Delhi

Spokesmen:

1. Dr. S. H. Zaheer, Director General, C.S. & D.R. & *Ex-officio* Secretary tothe Government of India, Ministry of Education.
2. Shri Baldev Singh, Industrial Liaison & Extension Officer, Directorate of Research Coordination & Industrial Liaison, C.S. & I.R.

3. Shri R. B. Pai, Patents Officer, C.S. & I.R.

(*The Witnesses were called in and they took their seats*)

Mr. Chairman: The evidence that you give will be printed and published and given to all our Members and also laid on the Table of the House. Even if you want any portion to be kept confidential, it will be printed and published and given to members and laid on the Table of the House. We have seen your memorandum and it has been circulated to all our Members. If you want to add anything and stress upon anything, you may please do so. Thereafter our members will put some questions.

Dr. S. Husain Zaheer: We have already submitted in broad outline. I am in full agreement with the proposed Act. I feel that the existence of a system of patents where 90 per cent are foreign patents has obstructed the growth of certain industries in the country, chiefly the chemical industry with which can be related the pharmaceutical industry and has resulted in high prices in the pharmaceutical industry also on account of that in the agricultural chemicals connected with that. I feel that the provisions which are now proposed to be made in the Act are very much in the right direction although my personal feeling is that they are also a compromise.

The compulsory licensing provisions, in the past, have not been of much assistance in view of the inordinate delays which compulsory licensing provisions entail.

The Patent System has come in the way of indigenous manufacture, for example paludrine, radio opaque dyes, reactive dyes and pharmaceuticals like tolbutamide. Indian entrepreneurs refuse to undertake manufacture of patented items because they cannot depend upon compulsory licensing provisions because it takes years to get through. Therefore, my view is that no patent should be granted for the manufacture of compositions or end use of pharmaceuticals, fine chemicals and drugs. No patent should be granted for any item for its end use. The decision to permit manufacture under compulsory licence should issue within one year from the date of application for compulsory licence.

The high prices in India of a number of these drugs—for e.g. chloromycetin, tetracycline hydrochloride—I feel, are due to the patent system. The prices in India are very much higer than the international prices. Italy is a good example.

It is sometimes said that the removal of the patent system will reduce the expenditure on scientific research on these items. Factually it is not so. In America about 350 million dollars are spent by pharmecutical firms and chemical firms on scientific research while in India the total expenditure is less than Rs. 1 crore and 80 per cent of this also is from State resources.

Similarly, for food items also, I think the patent system, especially patenting of processes and patenting of trade names for food items also is not conducive to development of food technology and development of food trade in the country.

Patent system, in my view, has proved detrimental to starting of new industries in the country. This position has been fully admitted by the two earlier Government Committees on Patents.

Secs. 22 and 23 have been of no use as foreign firms have adopted dilatory tactics. The compulsory licensing provisions have been practically of no use because of the tortuous legal process involved. We have failed to get from May & Baker licence for sulphathiazol in spite of intense litigation. Similarly, for ICI's paludrine. Hindustan Anti-Biotics has lot of trouble with foreign patentees

even with regard to the manufacture of penicillin and tetracyclin although they got them under WHO patents. Litigation is still in progress with a very well-known German firm and the Indian firm has asked for the revocation of the patent and it is going on for several years. Therefore, no patent should be granted for process of manufacture or of the end product in pharmaceuticals, insecticides and food and chemical products. If this is considered an extreme step, then at least the provisions which are now contained in the Bill should be accepted.

These are my general views.

Dr. C. B. Singh: How many patents have been taken by the National Laboratories recently either for drugs or chemicals or dyes or something else?

Dr. S. Husain Zaheer: Nearly 1,200.

Dr. C. B. Singh: How many of them are being utilised?

Dr. S. Husain Zaheer: We may say between 150 and 200—that is over 10 per cent.

Dr. C. B. Singh: Have you taken any patents outside India?

Dr. S. Husain Zaheer: Yes, Sir, we have taken about 200 patents outside India.

Dr. C. B. Singh: Is that bringing any foreign exchange to this country?

Dr. S. Husain Zaheer: No, Sir.

Dr. C. B. Singh: How is that?

Mr. Chairman: Are you not getting any royalty on this?

Dr. S. Husain Zaheer: From abroad, no, Sir. From India we are getting. Although we have taken about 200 patents, none of them is being utilised, though we are making efforts to utilise them. Of course, there are reasons for it. We have not been able to evolve any proper machinery for exploiting them. Normally, either these local firms that are there contact the interested parties or they appoint agents. We have also appointed agents, but they are not proving very useful.

Dr. C. B. Singh: Won't you agree that taking up of the patents by foreigners depends entirely on the utility and the advantages that can be had by the producing firms? If those patents were of that order, probably they will take it up, use it and advance it. Is that a correct assumption?

Dr. S. Husain Zaheer: I daresay it is partly correct, but partly also utilisation depends upon the agency efforts of a middleman who is able to convince the exploiting parties that they are useful and that they can go into production. I will cite in that connection one example. A drug with which I had some connection was synthesised in a laboratory which now belongs to the CSIR and we wanted to take a patent, but the authorities did not allow us to take a patent. Now that drug is being manufactured and sold all over the world. But initially we were not very keen at that time. We just published it; we were more interested in scientific research. We did not take any patent in India. And that drug is now being utilised extensively all over the world.

Dr. C. B. Singh: That supports my view.

Dr. S. Husain Zaheer: I am not sorry about it.

Mr. Chairman: Is it not a disincentive to our inventors?

Dr. S. Husain Zaheer: No, Sir. As a matter of fact, in this particular case, it has not proved a disincentive because we are still carrying on a very big school of research on these types of drugs.

Dr. C. B. Singh: You know that in Pimpri, we have taken a patent for one of the antibiotic products, Haemycin. This patent is being talked about

by American firms and they are prepared to pay even a high royalty. If that patent was taken outside, don't you think the country will get benefit and we will be earning a large amount of foreign exchange if it succeeds?

Dr. S. Husain Zaheer: Sir, in this particular case, I am doubtful. Here we are concerned only with a developing country like India and it is with particular reference to India that I am speaking. I am not against patents, for example, in Germany or the United States, but I am definitely against patents in India.

Dr. C. B. Singh: But why you are against patents in India?

Dr. S. Husain Zaheer: As I have explained in my opening remarks, there are two important reasons: one, it obstructs development of indigenous industry and indigenous knowhow and two, it leads to artificial high-pricing of some of the essential drugs which are required for the health of the population of this country and for the economic development of our country.

Dr. C. B. Singh: I don't know, Sir, if the witness is aware that the question of high price is a highly disputed one. Several witnesses have come and given evidence. It is a highly disputed point. Any way, we will not talk about it with him now.

Recently we went to the CDRI and there we found that there are very great chances for certain important things and if patents are taken outside, we are likely to get a large amount of benefit. So, if Indian scientists under your guidance are able to produce some new drugs or chemicals, which are of such an order that they will be patented in the outside world and will bring in a large amount of foreign exchange, don't you think it is advisable to have those patents taken out in this country as well as outside?

Dr. S. Husain Zaheer: This is what exactly I would like to repeat, that I am not in favour of taking these patents in India, but in a country like the United States where the system is very well established and methods for exploitation also are available and where we have no say whether patents should exist or should not exist, as long as it does exist, if it can bring some benefit to this country, I am in favour of it. For example, we have actually entered into agreements with two firms in the United States—the CDRI and the regional laboratory at Hyderabad—for the testing and patenting and later exploiting of drugs developed and worked in that laboratory. But we have made an exception. We have given them the world rights and a share of royalties except in India.

Dr. C. B. Singh: Now there are three types of patents: process patent, product patent and a combination of the two, product by process patent. Out of these three, our Bill describes patent by process alone. What have you to say on that?

Dr. S. Husain Zaheer: I personally would not give any patent either to the product or to the process.

Dr. C. B. Singh: Knowhow is somebination of the two—product by process?

Dr. S. Husain Zaheer: My personal view is, I would not advise Parliament or Government to allow any patent on either the product or knowhow or process knowhow....

Dr. C. B. Singh: Knowhow is something different.

Dr. S. Husain Zaheer: I am against any patent for product or process or product-*cum*-process.

Shri R. Ramanathan Chettiar: One fundamental point. Mr. Chairman, the learned witness being Head of the C.S.I.R. has been kind enough to come here to give evidence. From the beginning uptil now, he has been saying that he is against patents and he has also made a remark that if he were to advise Parliament and the country,

he is against patents for process or even for product. Sir, once the principle having been conceded and Parliament having brought forward a Patent Bill and it is being discussed by the Select Committee. I think it is too late in the day for the learned witness to....

Mr. Chairman: One can express one's views. We may accept it or we may not accept it.

Shri R. Ramanathan Chettiar: No, Sir, if he has come with that prejudged view, we are helpless.

Shri Sham Lal Saraf: It is for you to bring him out.

Shri R. Ramanathan Chettiar: Sir, let my remark be recorded.

Shri Sham Lal Saraf: Why should we prevent him?

Shri R. Ramanathan Chettiar: Mr. Chairman, I would like my remarks to be recorded.

Mr. Chairman: All right. Let them be recorded.

Shri M. R. Shervani: It is absolutely unfair remark. It is in a way intimidation of the witness. He has come here to give his frank opinion. Why should we....

Mr. Chairman: It is for you to accept it or not.

Dr. S. Husain Zaheer: Let me say, Sir, I am against patents for process, for product or process-*cum*-product in the fields which I have enumerated.

Dr. C. B. Singh: Here in our Bill, we have mentioned that in case of dispute the final decision will lie with the Government. Will you say anything on that?

Dr. S. Husain Zaheer: I think that is very great advance that it is not justiciable but it is by an executive decision. Government takes a decision, whether to allow or not to allow it.

Dr. C. B. Singh: People have come to say that if you leave a decision to the executive, it cuts at the very root of the judiciary.

Dr. S. Husain Zaheer: We already have many decisions which are executive decisions. It is the overall well-being of the industrial development and also of the country which is involved here and Government, I believe, is fully justified in taking authority into its own hand to take a decision in public interest.

Dr. C. B. Singh: You agree that in the present state of advancement we are in need of foreign capital for our advancement. Do you agree or you do not agree?

Dr. S. Husain Zaheer: I think we do need for investment, but it should be on mutually agreed conditions.

Dr. C. B. Singh: But you agree to the need for foreign capital here. Don't you?

Dr. S. Husain Zaheer: Yes, but perhaps not in the fields which I have enumerated.

Dr. C. B. Singh: That is in drugs, chemicals, food stuffs.

Dr. S. Husain Zaheer: Broadly 'No'.

Shri M. R. Shervani: You have stated that industrial development has been retarded by the existing patent law and the present one, although an improvement on the same, is a sort of compromise. May I ask if you could suggest as a further inducement to industrial growth that the 10 years term be reduced to 7 years in drugs. I will explain it. In our Bill, we have given a 10 years period as the life of the patents on drugs and food stuffs. In view of your definite opinion that patent system retards industrial growth and research, would you recommend reduction from 10 years to 7 years?

Dr. S. Husain Zaheer: I am personally in favour of that.

Mr. Chairman: Shri Chettiar:

Shri R. Ramanathan Chettiar: In view of the pre-judged views of the learned witness, I, as a protest, am not participating.

Mr. Chairman: That is all right.

Dr. S. Husain Zaheer: What is the pre-judged view? I have given it in writing.

Mr. Chairman: He is not a Member of Parliament.

Shri R. Ramanathan Chettiar: He has not given in writing.

Mr. Chairman: In the Memorandum, he has said he is against all.

Dr. S. Husain Zaheer: The whole purpose of this meeting is that I have been called to give my views.

Mr. Chairman: That is his view. You may or you may not accept it.

Shri B. K. Das: There are other witnesses who have also said that. I do not know what objection my friend is taking. Dr. Zaheer, you have said in your Memorandum on page 15 that "reference to CSIR may be excluded from the definition of clause 2(1)(h) unless the original clause 41(10) referred to above is restored". Would you kindly explain this? What is the difficulty?

Dr. S. Husain Zaheer: Sir, we are a registered society of the Government and we would not like to exercise the authority of Government. It is the executive body of Government which should exercise that authority. They can ask for our advice and we will be very happy to give that and in fact it is our duty to do so.

Mr. Chairman: It is included there as Government undertaking. You are considered part of the Government. Your institution is tried to be included as a Government institution like hospitals, like universities. You have got any objection to that?

Shri R. B. Pai: There are certain penal provisions in the Bill under which if the Controller General asks for some information about the extent of exploitation and the Officer Incharge of Government undertaking is not able to satisfy him, then he is liable to be imprisoned. There are some penal provisions like that. That is one thing which we will be calling upon ourselves by being included in the Government undertakings, whereas we do not see any corresponding advantages by that inclusion. Formerly we had requested that we may be included as a Government undertaking, because there was a provision in the draft bill at the earlier stages that Government undertakings would be excluded from the application of provisions regarding compulsory licences, which would have been very advantageous for the Government undertakings.

Mr. Chairman: You refer to the original clause 41(10).

Shri R. B. Pai: I suppose so. That clause has been removed. There is really no benefit in being a Government undertaking. At the same time, we would be liable to this.

Shri B. K. Das: On page 16, you say the method of testing should be made patentable. Will you kindly explain this?

Shri R. B. Pai: We had a very good invention from the Central Leather Research Institute for a microscopic method of testing the wool to find out whether a particular sample of wool is good or bad. By chemical treatment followed by just looking into the microscope, we could vividly see picturesquely whether the sample was good or bad. That was a method of testing and a very meritorious invention. But under the existing law we could not patent that invention. Methods of testing can be very useful industrially. Just as a

process can be useful, a method of testing is also a type of process which is industrially useful and such processes are patentable in U.K.

Mr. Chairman: Are there any other countries?

Dr. S. Husain Zaheer: In the U.K. it is patented.

Shri R. P. Sinha: I will like this to be noted. If there is something which is used in the United Kingdom, that method should be looked into. We should incorporate that also.

Shri B. K. Das: That process includes testing also.

Dr. S. Husain Zaheer: Yes, Sir.

Shri Sham Lal Saraf: Mr. Zaheer, in the present state of development in our country it is an established fact that unless you get the knowhow or encourage research and inventive capacity in the country, perhaps the country may lag behind. Now keeping that in view and also keeping your views in our sight that you are absolutely against getting things patented, may I know what other ways would you suggest that would help in creating scientific knowledge within the country successfully?

Dr. S. Husain Zaheer: I think, Sir, that the progress in our scientific and technological levels has been quite adequate to supply the requirement of the country in these fields—chemicals, pharmaceuticals, agricultural chemicals, food, etc., these particularly. I would also, however, point out one thing, Sir, and that is that authorship certificate may be permitted to encourage further indigenous scientific work in the country.

Shri Sham Lal Saraf: That is quite a separate subject to be dealt with. But here I would like to know that keeping the present progress made in these pharmaceutical, chemical, food, processing industries in view, may I know if Dr. Zaheer is aware as to what percentage of it has come nder the Patent Law or has been registered under the Patent law?

Dr. S. Husain Zaheer: Sir, more than 90 per cent are foreign patents. And major products—some of which I may name, Sir, like Chloromycin, Tetracyclin, Tolbutamide—and even the intermediaries of these are covered by patents.

Shri Sham Lal Saraf: The hon. witness has not caught my point. As far as manufacture is concerned, what percentage of it has come under the Patent Law? I could say it is hardly 2 per cent. Therefore, 98 per cent of it is absolutely free for people to manufacture. 2 per cent of the lot are very important to life-saving drugs. I would ask Dr. Zaheer whether he knows of any inventive institutions that would go to help the country by manufacturing all the types of these life-saving drugs?

Dr. S. Husain Zaheer: We would certainly be able to develop process which can make these life-saving drugs. We may not be able to invent new life-saving drugs and if incentive and encouragement are given that will probably encourage to develop life-saving drugs.

Shri Sham Lal Saraf: I would like the hon. witness to tell us what incentive would he recommend to be given to scientists?

Dr. S. Husain Zaheer: The main thing is the development of a healthy indigenous industry free from the obstruction of patents which will itself be an inducement for scientists to assist and help these industries and they will become part of the industry itself. It will give them necessary encouragement and the excitement for better work and hard work.

Shri Sham Lal Saraf: May I ask the Director-General, CSIR, in these physical laboratories all over the country, so far how many such inventions have they found out which are patent or non-patent that have been translated

into practical work, whether in the factory or in the field? Would he be able to tell us?

Dr. S. Husain Zaheer: Sir, the investment of the scientific effort which is required for progress in original type of drug research is not adequate in the country. It is not comparable to what is being done in a country like Japan. Japan has attained a certain very great degree of self-sufficiency in this because of bigger investment and because of non-existence of patent laws.

Shri Sham Lal Saraf: There is a patent law in Japan.

Mr. Chairman: The patent law is there in Japan for a number of years. That is what the witnesses who came before us, told us.

Dr. S. Husain Zaheer: Sir, there is a general expectation that foreigners could not expect patent protection in Japan, and it is only recently that the situation has changed somewhat. They were allowed freely the utilisation of foreign know-how in the country. But the reply to the hon. Member on my right, as I have said in the beginning, is that discoveries of new drugs in the country have been almost nil. But the development of knowhow processes where patents have expired or where patents have either been bought or licensed, have been done in collaboration with people who have taken patents. There is one case where an entrepreneur developed the know-how at the National Chemical laboratory of a very important dye. He was threatened by the foreign patent-holder for prosecution. He went ahead and he said, 'All right, you can threaten me but still I will go ahead. I want to be in a position where I can bargain with you better'. He went ahead and eventually this patent-holder had to sell his patents to him and this material is being made by the Indian partner.

Shri Sham Lal Saraf: The hon'ble witness has said that today we are not rich in the know-how and secondly we are not in a position to manufacture life-saving drugs because the reasons are obvious. How does he propose to bring this country in line with the rest of the countries in the world who have gone far ahead of us in the scientific field?

Dr. S. Husain Zaheer: I am sure, taking two or three important drugs, for instance, Chloromycin, Tetracyclin and Tolbutamide, within a very few months we will be able to develop indigenous know-how to make these life-saving drugs irrespective of the Patents.

श्री ब्रज बिहारी मेहरोत्रा : सी० एस० आई० आर० में जो रिसर्च हो रही है इंडेजनस मैडीसिस के लिए तो क्या इसलिए कि पेटेंट के मुआफिक नहीं है और चाहते हैं कि नो हाउ लोगों के पास पहुंच सके और उससे लोगों को सस्ते में फ़ायदा पहुंच सके ?

डा० एस० हुसैन जहीर : जी हां एक वजह यह जरूर है।

श्री ब्रज बिहारी मेहरोत्रा : दूसरी चीज मैं यह पूछना चाहता हूं कि यह जो इंडिजनस मैडीसिस के बारे में आयुर्वेद और यूनानी मैडीसिस के बारे में रिसर्च रही ही है उस में आपको आयुर्वेद की और यूनानी किताबों की फर्स्ट हैंड नौलिज मिलती है तो क्या यह अच्छा नहीं होगा कि आयुर्वेद के और यूनानी हिकमत के वहां जो साइंटिस्ट्स हों वह भी रक्खे जायें आपके इंस्टीच्यूट में उससे बहुत फ़ायदा होगा ?

डा० एस० हुसैन जहीर : जहां तक आयुर्वेद और यूनानी मैडीसिस के विद्वानों का ताल्लुक है उनसे हमारा ताल्लुक हमारा राब्ता बहुत करीबी हो गया है लखनऊ में लेकिन साइंस के तरीके और मैथड्स एक हैं और उनमें हमारा कोई तफरका नहीं कर सकते चाहे वह यूनानी हो, आयुर्वेदिक हो या एलोपैथिक मैडीसिन हो अगर वह साइंसी तरीका अखत्यार करते हैं और साइंटिफिक थिंकिंग के मुताबिक काम उनका हो तो वह साइंटिस्ट्स

हो जाते हैं और उनकी जगह जरूर हो जाती है ।

श्री ब्रज बिहारी मेहरोत्रा : शायद मैं अपने सवाल को साफ़ नहीं कर सका । क्या आपके यहां जो साइंटिस्ट्स हैं उन में ऐसे साइंटिस्ट्स भी होंगे जो खुद आयुर्वेद के विद्वान हैं यूनानी के विद्वान हों और साइंटिस्ट्स भी हों तो फर्स्ट हैंड नौलिज ज्यादा कारामद होगी आप के सी० एस० आई० आर० के लिए ?

डा० एस० हुसैन जहीर : ठीक बात है । एक ऐसा इंस्टीट्यूट ख़ास तौर से आयुर्वेद दवाओं के लिए कायम किया है जामनगर में और उस से हमारे लखनऊ के इंस्टीट्यूट से बहुत काफ़ी और करीबी के ताल्लुक़ात हैं ।

श्री ब्रज बिहारी मेहरोत्रा : मैं यही पूछ रहा था कि क्या यह ज़रूरी नहीं है कि ऐसे एक दो इंस्टीट्यूशंस हों ?

डा० एस० हुसैन जहीर : मैं बिलकुल आपकी राय का हामी हूं ।

श्री ब्रज बिहारी मेहरोत्रा : आपके सी० एस० आई० आर० में अगर आयुर्वेद और यूनानी के विद्वानों को भी रखा जायेगा तो उनकी फर्स्ट हैंड नौलिज आपको ज्यादा यूजफुल साबित होगी ।

डा० एस० हुसैन जहीर : आप बजा फरमाते हैं । वहां हर किस्म के साइंटिस्ट्स हों चाहे वह आयुर्वेद के हों यूनानी के हों या एलोपैथी के हों और ऐसा होना जरूर कारामद साबित होगा ।

श्री ब्रज बिहारी मेहरोत्रा : शुक्रिया ।

श्री विभूति मिश्र : आयुर्वेद में चाहे यूनानी में जमाने दराज़ से दवाओं के फारमूले लिखे हुए हैं । उसकी खूबी यह है कि जो उन जड़ी बूटियों को लेकर उचित ढंग से औषधि तैयार करे तो दवा ठीक उतरती है उसी तरीके से यह पेटेंट्स हैं जो पेटेंट कराते हैं तो पेटेंट की जो इनग्रीडियंट्स और कम्पाउंड्स हैं उन को उसी तरीके से लेकर ढंग से अगर बनायें तब वह दवा ठीक तरीके की निकलेगी । आज तक आयुर्वेद या यूनानी में किसी ने पेटेंट नहीं कराया लेकिन हजारों लाखों वर्ष से वह दवाएं चल रही हैं बाकी आज यह पेटेंट की प्रथा चल गई है जिसमें एक आदमी को एक मोनोपली दे देते हैं जो कि मेरी समझ में तो मुल्क के लिए नुकसानदेह है लेकिन मैं जानना चाहता हूं कि आपकी राय उस बारे में क्या है ?

डा० एस० हुसैन जहीर : मैं बिलकुल माननीय सदस्य से उस में सहमत हूं ।

श्री विभूति मिश्र : इसके मानी यह हैं कि आप पेटेंट के कानून के खिलाफ़ हैं ?

डा० एस० हुसैन जहीर : जी हां ।

श्री विभूति मिश्र : मैं जानना चाहता हूं कि जिस समय सरकार इस पेटेंट कानून को लाई उस समय उसने आप की मिनिस्ट्री से या आप के डिपार्टमेंट से कंसल्ट किया था ?

डा० एस० हुसैन जहीर : हम ने अपनी तहरीरी राय पेश कर दी थी और आपकी जो राय है उससे वह बहुत मिलती जुलती है ।

श्री विभूति मिश्र : सरकार की तरफ से जो लोग इस बिल को लाये हैं मैं उनसे पूछना चाहता हूं कि जब साइंटिस्टस की राय इस पर इस किस्म की थी तो वह आख़िर कौन सी जिम्मेदारी पर इस पेटेंट बिल को आगे लाये हैं ? यह मैं आप से नहीं पूछता हूं ।

Shri P. S. Naskar: That we shall discuss among ourselves. You may please ask the questions to the witness now.

श्री विभूति मिश्र : अब तक जो पेटेंट का कानून रहा है और हिन्दुस्तान में जो आगे बनेगा उससे दवाएं सस्ती रहेंगी या महंगी रहेंगी ?

डा०स० हुसैन जहीर : अब तक जो रहा है उसकी वजह से दवा महंगी रही है बाकी अब जो तजवीज़ पेश की जा रही है उससे मुझे उम्मीद है कि दवाओं की महंगाई में कमी होगी ।

श्री विभूति मिश्र : हिन्दुस्तान एक गरीब देश है और यहां प्रति व्यक्ति आमदनी का औसत बहुत कम है 20 या 25 रुपये के करीब है तो ऐसे लोगों के लिए आप के पास इस पेटेंट बिल में कुछ सुझाव हैं जिससे इस देश की गरीब जनता को सस्ते दामों पर दवाएं सुलभ हो सकें ?

डा० एस० हुसैन जहीर : मेरी राय है कि सरकारी बिना पर नेशनल ड्रग्स जो कि ख़ास तौर से लाइफ़ सेविंग चीज़ें हैं वह सरकार द्वारा नेशनल स्केल पर न बनायी जायें और यदि ऐसा किया जाता है तो दवाओं की कीमत कम होगी ।

श्री विभूति मिश्र : हम लोगों ने घूम फिर कर इस समस्या का अध्ययन करने का प्रयत्न किया है । जो दवाएं बनाने वाले हैं वह कहते हैं कि बाहर से हमारे पास चीजें आती हैं जिनके कि कारण दवाओं के दाम यहां पर ज्यादा बढ़ जाते हैं तो क्या आप कोई ऐसा सुझाव दे सकते हैं कि बाहर से जो यह दवाएं आती हैं उनके बदले यह कम्पोजिट चीजें यहां इस तरीके से मिल जायें ताकि हिन्दुस्तान की जनता को सस्ती दवा मिल सके ?

डा० एस० हुसैन जहीर : जी हां सिर्फ 50–60 दवाएं ऐसी हैं जो कि वाकई ज़रूरी और लाइफ़ सेविंग कही जा सकती हैं बाकी जो हैं वह सिर्फ़ कम्पोजिट मिक्सचर्स हैं लेकिन आपने जो सवाल किया है कि इन दवाओं के बनाने में जो इंटरमीडियरी दरमियानी चीजें लगती हैं वह भी हम फिलवक्त नहीं बना रहे हैं बाज उन में से पेटेंट के भी अन्दर हैं और हम उनको बना भी नहीं सकते । हम उन्हें बना नहीं रहे हैं वह चीजें भी हमको बड़े ऊंचे दामों पर हमारे हाथों में बेची जाती हैं जिसके माने यह होते हैं कि जो प्रोडक्ट्स हम बनायेंगे उनको इम्पोर्ट करके बनायेंगे तो उनकी कीमतें लाजिमी तौर पर ऊंची रहेंगी । यह पेटेंट बिल अगर मंजूर हुआ तो उसका लाज़िमी नतीजा होगा कि हमको वह चीजें अपने देश में बनानी पड़ेंगी और हम उनको सस्ते दामों पर बना सकेंगे ।

श्री विभूति मिश्र : चंडीगढ़ में एक फाइजर नाम की दवाएं बनाने वाली कम्पनी है उसकी 90 लाख या उससे ज्यादा की पूंजी लगी हुई है । उस का हिसाब हमने देखा है तो मालूम हुआ है कि 30–35 लाख रुपया साल में उसको नेट प्राफिट होता है । अब इस तीस लाख की वह बाहर से दवाएं मंगाते हैं तो क्या आप ऐसा नहीं सोचते हैं कि हम यहां स्वयं अपने वहां दवाओं का इंतजाम करें ताकि वह किसी विदेशी कारपोरेशन से दवाएं लें हिन्दुस्तान में स्वत: यहां के आदमियों को दवाएं बनाने का अधिकार दें ?

डा० एस० हुसैन जहीर : मेरी यह राय होगी कि इन्हें अपनी देसी आदमियों से बनवायें ।

Shri K. K. Warior: I understand that the CSIR have been in the earlier days taking more patents but they have discontinued that in the later period. Is there any cogent reason for that?

Mr. Chairman: They do not want any patent now.

Dr. S. Husain Zaheer: As long as the Patent system exists we are also taking patents but we are much more strict now than we were about four or five years ago. But we are very much stricter than we were about four or five years ago. We first assess the

value of the patents and then we go in for patenting. Formerely we had no idea or no new thought about this. Thereafter a little improvement was made. We used to go in for our own Indian patents. This tendency we are trying to discourage.

Shri K. K. Warior: We are given to understand that even now the C.S.I.R. have got certain processes which they are not willing to get them patented although the process is entirely new and it is valuable novelty.

Dr. S. Husain Zaheer: Inspite of our strict control, the number of patents that we took over was very much considerable. Last year we took about 115.

Shri B. K. Das: You are in favour of the C.S.I.R's continuing to act as patent Agents and this is what you have stated in your memorandum on page 4.

Dr. S. Husain Zaheer: Yes, Sir.

Mr. Chairman: Do you want your Patent Officer to act as an agent for foreign firms for the assessment of the value?

Dr. S. Husain Zaheer: My colleague will answer this question.

Shri R. B. Pai: In Russia, we have the Chamber of Commerce which acts as the patent agents for foreigners who want to take out patents in Russia. This is on an obligatory basis. Now, there is a suggestion that since the C.S.I.R. have got its own patent unit for helping the scientists to take out patents, we can extend this service to foreigners so that the foreign exchange which now goes from India as patent fees to patent attorneys who are of foreign nationality can be earned by us for our own country.

Mr. Chairman: Do you want the foreign patents to route through you?

Shri R. B. Pai: We do not want that to be routed through us on a compulsory basis. But, we can do that on a voluntary basis. We can do that to start with.

Shri B. K. Das: Your idea is that in that way you will be helpful to the foreigners and some foreign exchange earnings will be there in the whole to trade.

Dr. S. Husain Zaheer: The idea is no doubt to earn foreign exchange.

Shri Shyamnandan Mishra: I am not quite sure whether my questions have already been covered. However, one or two questions occur to me just now. Firstly, since the C.S.I.R. are concerned with research and development primarily, would they be good enough to tell us what steps they have taken to see that when a particular drug industry is not in a position to undertake the research on its own, the C.S.I.R. undertakes the research and development on the basis of a kind of united effort in a few units?

Dr. S. Husain Zaheer: We have proposed this to the Indian Pharmaceutical Manufacturers Association to form a Research Association actually two days ago when I was in Bombay. Speaking with their representatives, they said that the nature of their operations undertaken was such that they were inhibitive from taking a cooperative research. But, still, they want to do this. On the other hand, there are now parties who are coming to some of our own laboratories and sponsoring research in our laboratories and paying for them; but, they are managed on an individual basis and not on a team basis. But, I understand that a group of pharmaceutical manufacturers in Bombay comprising of four or five parties is considering to take this up.

Shri Shyamnandan Mishra: Here, my point is this. Suppose the individual units take a stand that they could not do this on a cooperative basis. Would it not be possible for the C.S.I.R. to undertake the research

on their behalf on the basis of making a matching contribution which the Government is always willing to share?

Dr. S. Husain Zaheer: An effort has been made to form a research association. We will give them 50 per cent of their expenses that they spend. But, they have not yet formed their association to undertake that job. However, they are coming to our existing laboratories and asking us to work for them on payment.

Shri Shyamnandan Mishra: Would it not be possible to make it a compulsion that they should make some contribution?

Dr. S. Husain Zaheer: That was the recommendation of the Scientists and Industrialists. We are actively pursuing that with the Ministers of Finance and Commerce and Industry.

Shri Shymanandan Mishra: Let me ask about the foreign collaborations which are occurring just now. Whether the C.S.I.R. is convinced that if these foreign collaborations which are taking place just now are permitted to take steps in the same way, then there would be many unnecessary patents also taken out in India. Are the foreign collaborations in any way responsible for many patents to be taken out in India which may not be considered necessary?

Dr. S. Husain Zaheer: Yes, Sir. 90% of the patents in India are of foreign patents. It reacts and that leads to foreign collaborations. I can tell you as an example Tetracycline. It is covered under patent. We have to go to a foreign party if we want to make this drug in our country either by buying that or by persuading them to come here to set up a unit for this purpose.

Shri Shyamnandan Mishra: What is particularly important is that in the name of import substitution, at the moment, unnecessary things are being produced in India and many foreign collaborations are taking place. The term 'import substitution' is so fasionable that under this term, many things are being done in this country. Whether the C.S.I.R. has a particular role to play in this regard and whether they consider it necessary or not when many patents are being taken out in India because of foreign collaborations which are not necessary to-day. We are incurring a loss in terms of foreign exchange because of this.

Dr. S. Husain Zaheer: I am quite in agreement with you. When foreign collaborations take place, they must be closely scrutinised by technical people, by economists and by competent people who are able to give their unbiased and objective view on the necessity of such foreign collaborations.

Shri Bibudhendra Mishra: Has there been any case where the technical know-how has been taken by some party—I do not exactly remember the name of the party—from one of the national laboratories which subsequently has been found to be not workable.

There have been cases where it has been workable, *e.g.*, Vit C. Are there any case in the negative?

Dr. S. Husain Zaheer: The actual passing over of the know-how after a process has been patented is not done by CSIR but is done by the National Research Development Corporation which is not a part of CSIR. It is a separate society. Just at the moment the Director-General of CSIR happens to be the Chairman of that Corporation. My personal view is and I have also tried to persuade the NRDC as Chairman at a Board meeting that before we pass on the know-how and before we receive any lump sum royalty we must ourselves ascertain that the process is commercially workable.

Mr. Chairman: That is being done now?

Dr. S. Husain Zaheer: It is being done now very strictly and I would say in recent years any case of the type that you are mentioning is not most likely to occur. Earlier there was one case of aluminising which was a very important one where one of our laboratories has claimed and they have done a very good work and they sold it. There was one other case of manganese where we received a fair amount of royalty. But on close examination we found that it still required to be done. Therefore we have withdrawn our objection for holding up their work till we complete the know how and in another six months we feel we will be able in a position to say, 'We are now ready and go ahead'.

Mr. Chairman: How many of your processes have been patented and accepted by the industry in India?

Dr. S. Husain Zaheer: About 150—200.

Mr. Chairman: Industrially?

Dr. S. Husain Zaheer: About 150—200 patents have been licensed and about 80 are in production.

Mr. Chairman: Is there any liaison between the industry and your Department?

Dr. S. Husain Zaheer: We have taken very active steps in that direction. During the last few years there is a complete Directorate for liaison and co-ordination which establishes very close connection with the industry, in taking problems from them for research and in passing out our completed process to them and helping them and we have also established a design and engineering unit which helps the laboratories as well as the entrepreneurs who take our licenses to work out these processes so that these can be commercially exploited. We have formed also in collaboration with the Chemical Manufacturers Association a liaison bureau one of which works in Bombay and the other one is in Calcutta. We are in close touch with the Chemical Industry—taking out problems from them for research in the laboratories and passing out our know-how to them for exploitation.

Mr. Chairman: All the three organisations, *viz.*, The CSIR, Defence Research Organisation and the National Research Development Corporation—are working in close collaboration with each other or is there anything to be desired?

Dr. S. Husain Zaheer: There is so much to be desired for close collaboration.

Mr. Chairman: What are the methods you would suggest?

Dr. S. Husain Zaheer: We have taken some steps to have this collaboration. For example, the CSIR has organised a special unit which we call the Defence Co-ordination where we try to coordinate not only with the Defence Research Organisation but with scientific and technological problems of defence which we have and we can offer solution to them in our laboratories. During the last $3\frac{1}{2}$ years we have actually taken nearly 175 problems and 84 of them have been solved and given over to them for exploitation. Similarly with the industries. The NRDC is a very small organisation really but the Corporation is established by having the present Director-General of CSIR as the Chairman and a number of Directors of the Laboratories of the CSIR are members of the Board of NRDC. Therefore we have close collaboration with the industry. In the 8 corporate industries we have very close collaboration, *viz.*, textiles, cement, tea, synthetic fibres, jute. There we have close collaboration and also we give representation to the Defence Science personnel in our executive councils and our Scientific Advisory Committees of the laboratories which formulate the research programme of the laboratories. So, in that way we are trying to get together, but I am afraid I am not satisfied with it. It should be much closer than this.

Mr. Chairman: Am I right when I say that all the National Laboratories are working under the CSIR?

Dr. S. Husain Zaheer: That is the name given. Of course apart from National Laboratories there are other laboratories which are not called National Laboratories but which are also working under the CSIR. We have got 34 institutions and 8 corporate institutions.

Mr. Chairman: Is there exchange of notes about the work done by each laboratory, for *e.g.*, as between these laboratories and the NRDC and the Defence Research Organisation so that there is no overlapping?

Dr. S. Husain Zaheer: One of the foremost functions of our own co-ordination and liaison unit is to keep a record of the scientific work going on in the different laboratories and when there is parallel overlapping work or work of similar type it is the duty of this organisation to bring the scientists from these different units where similar type of work is being done. For *e.g.* solid state physics and ferrites—there are 2 or 3 laboratories working on them. We bring them together and under the inspiration of the co-ordination unit the problems are discussed in all broader aspects and framed out depending upon the availability of equipment and scientists. They meet every year to discuss the progress made. But the NRDC itself does not do any research work at all. Actually it is only a very small office—with an executive director, a Secretary and a few clerks and only they peddle our processes and get the licence fee. Their work stops there. I think that is unsatisfactory. As I said earlier, they ought not to peddle our processes unless they have got a machinery and they are themselves convinced that those processes are workable.

Mr. Chairman: You told the Committee that you are against patents for chemicals and articles of food. But you know that one of the inventions in the Pimpri factory is Hyamycin and they have taken out a patent in America and they are getting Rs. 7½ lakhs royalty. If patents are abolished, anybody would be then free to use the processes and inventions that your scientists have made. Would it not be a disincentive to scientific inventions?

Dr. S. Husain Zaheer: I have made it clear that I would not advise abolition of patents in the United States. It is the state of our economic development which induces me to recommend that patents here should be abolished in these fields. I would be against taking a patent for Hyamycin in India but I would not be against taking a patent for it in the United States.

Mr. Chairman: If you are not willing to give protection in your own country for your scientists how can you ask for protection in another country?

There will be double-dealing. You must have some standard.

Dr. S. Husain Zaheer: We want another type of protection or inducement or encouragement, that is, diverting our attention to find out processes of manufacturing cheaply and economically medicines which are to-day covered by patents. Our gains will be much more at the moment by not allowing patents....

Mr. Chairman: If there is no patent law, anybody will be free to utilise your inventions anywhere in the world. How do you protect it?

Dr. S. Husain Zaheer: I have not the power to recommend that patents should be abolished in the United States....

Mr. Chairman: No, no; if we abolish the patent law here, anybody from U.S.A. or U.K. or Germany can exploit your invention and manufacture it in their country and also in this country.

Dr. S. Husain Zaheer: As long as they manufacture in this country, I

would have no objection at all. I would certainly be free in selective cases to take a patent where the patent system exists even though I may not take a patent here. As I mentioned to you, the agreements which we have arrived at with some American firms to utilise and patent our discoveries and inventions will apply to the whole world but not to India.

Mr. Chairman: I want to know how you are going to protect your own scientists here. They will exploit their inventions in India.

Dr. S. Husain Zaheer: I have suggested the authorship system. Even then, numerically, the number is so small that it is insignificant. Ninety per cent of the patents are foreign patents. The gains you will get in utilising these 90 per cent of patents will for outweigh the losses which you might suffer in not having patent protection.

Mr. Chairman: You yourself said that you have taken 1,200 patents.

Dr. S. Husain Zaheer: All of them are not in the field of drugs and pharmaceuticals.

Mr. Chairman: May be. Patents give protection for a particular period to the inventor to exploit his inventions. If you don't have any patent, anybody can come and exploit them.

Dr. C. B. Singh: If the SCIR does not patent a thing, somebody else will get it patented. As long as the patent law is there, it is better to get them registered as patents.

Dr. S. Husain Zaheer We are compelled to do so, as long as the patent law is there.

Mr. Chairman: You say "the system of utilisation of CSIR patents approximates to the Authorship system. It is felt that the CSIR system should be extended to Indian inventions in general." What is the system you are following now?

Shri R. B. Pai: The idea of the Authorship Certificate is that the exclusive privilege will vest with a statutory body or with the Government. Now the inventors take out patents here. But the patents are taken out in the name of the Council of Scientific and Industrial Research which is a public registered society anl also a statutory body. Now no one can blame the CSIR for exercising its monopoly privilege in a way that is not conducive to public welfare. So the idea that we suggested is that if we have the Authorship Certificate system, the inventor will get an authorship certificate but the monopoly will not rest with him. There won't be a private monopoly, but the State will take over the patent and exploit it and just as the CSIR does, give the inventor a liberal amount, say, Rs. 40 out of every hundred rupees....

Mr. Chairman: It does so at present?

Shri R. B. Pai: Yes. We can have the same sort of thing for drugs and pharmaceuticals also. For instance, we can say 'we won't give you the ordinary type of patent, but we will give you an authorship certificate so that the exclusive privilege rests with the Government and the patent may be exploited by the Government. If it is a profitable work, we will give a proportionate share of the value of the social utility of the patent to the authors, or if he has assigned it to a manufacturer, to the manufacturer or whoever steps into the shoes of the author." In this way, the patent can be used in the best interests of the country. There may be exclusive licences; there may be non-exclusive licences as we are doing it. We may grant it to a public body or to a private manufacturer. The freedom will be there and the discretion in every case will be exercised by a statutory body. That is the idea.

Mr. Chairman: On page 17, you have said "....patents should be granted for other plant inventions

such as a sexual reproduction (*e.g.*, by techniques such as grafting, budding, cutting, layering, division and the like) of new varieties of purely commercial plants, ornamental trees, flowers, bushes, hedges, etc." Is it prevalent in any other country?

Shri R. B. Pai: Yes, Sir, the plant patent system prevails in the U.S.A. and now there has been an international agreement between the U.K. and some other countries where new species of plants are granted a special protection. So this is an important field where our workers in the field of agricultural science will have a scope to practise new ideas in the field of generating new species of plants or biological inventions.

Dr. S. Husain Zaheer: There is a rose-breeder in England whose annual income from royalties is over £10,000. He gets, I think, three shillings on every rose plant which he has bred. We will have no objection to ornamental trees, but the commercial side should be protected with patents.

Mr. Chairman: You say on page 24, 'the practical difficulty of making a world-wide search has already been referred to. Novelty should be judged only with reference to what was known in India on the date of the patent." Is that method prevalent in other countries also?

Shri R. B. Pai: In a very large number of countries. I think it is prevalent in U.K. and all Commonwealth countries: There novelty is judged in the light of what was public knowledge, what was publicly known, in the country on the date on which the patent application was filed. This is a very economic system as compared with the American system where they go in for a world-wide search with a huge army of examiners. A tremendous amount of expenditure is incurred by the Patent Office, but still they are far from being able to catch up with the terrific pace of technology in the world. In any case, if a person in India makes an invention and somebody might have made it in a very remote part of the world and the information may not have reached this country at all. So why should this patent be invalidated? He has given some new knowledge to this country. Therefore, this should be patented.

Dr. C. B. Singh: There is a possibility that he might have copied it and brought it over here.

Shri R. B. Pai: If the knowledge has reached this country, then he has done a service to this country by bringing this knowledge promptly and disclosing it to our country.

Dr. C. B. Singh: But the one who first got it patented will object to it; won't he?

Shri R. B. Pai: That will be the case if we adopt the world system. But the system which is now worked in England and in many other Commonwealth countries is that the knowledge is judged by what was known in the country on the date the patent application was field.

Mr. Chairman: That means steeling somebody else's property.

Dr. S. Husain Zaheer: They are stealing oniy if it is known in the country.

Shri B. K. Das: Search should be of knowledge available in the country, not outside India, as has been provided here in the Bill.

Dr. S. Husain Zaheer: Outside knowledge also if it has reached India becomes Indian knowledge.

Mr. Chairman: On page 31, it is stated penal clauses require revision to ensure that bonafide inventors are not discouraged from filing patents. What is your suggestion for this?

Shri R. B. Pai: If the idea of Patent law is to encourage the inventor and to give him protection and a pat on

the back, he should not be threatened with imprisonment for not furnishing whatever information the Controller may ask for. As worded, the Controllor is free to ask for anything—there is no strict limit to what he may ask for—and if the inventor fails to provide that knowledge within a few weeks, it is stipulated that he could be sent to the prison. This may deter a large number of inventors from applying for a patent at all. It may be much better to keep it a secret and try to exploit it as a secret process or just publish it and not to bother to take out a patent.

Mr. Chairman: What are the functions of a Patents Officer in the C.S.I.R.

Shri R. B. Pai: To help our inventors to take out patents.

Dr. S. Husain Zaheer: Something similar to Public Patents Attorney, a kind of internal patents officer who drafts our patent applications, who checks up whether the application is right or not.

Mr. Chairman: Recognised as Patents Agent also?

Dr. S. Husain Zaheer: For other parties also.

Mr. Chairman: We have introduced a clause in the provisions regarding Patent Agents that whoever wants to be a patent agent should have some Degree in Science or Engineering. Does it in any way affect you?

Shri R. B. Pai: I am not in favour that provision so fas as Degree is concerned. Let us take the most advanced country—U.S.A. for instance. What is required is that the man who wants to practice as a patent agent should have the necessary legal and scientific background. This is interpreted in U.S.A. to mean that if a man has his name entered in the Bar of a District Court of a State Court—he is a Barrister—he is presumed to have the necessary academic scientific background. Apart from that let us take the case of the U.K. There are provisions which say 'if a man has worked in a patent agents' firm and is over 25 years, he is an experienced man in the line and they do not bother about this Degree at all. This is for the first time that such a provision is being brought in this country and there are very competent and experienced patent agents who have been in the line for over 25 years nearly, they have got the necessary technical and scientific background by working in colaboration with inventors. We should not be very rigid about this.

Shri K. K. Warior: Have you come across a similar provision in any other country?

Shri R. B. Pai: I am not aware. I think there is no country in the world where a Degree in Physical Science or Engineering is regarded as an essential qualification. I have tried to look into this matter. There are two things—one is for the new entrants. For that Australia is one of the countries where they insist on a technical degree. But taking the case of people who have already been in the line, there is no country in the world which would debar a man from registration just because he does not have a degree. If we admit a raw graduate to become a patent agent, the idea of excluding a man who has been in the line for 25 years, who has done brilliant work, whose work is appreciated, is not reasonable.

Dr. S. Husain Zaheer: Some safeguard to protect such people who have attained efficiency through actual practice over a certain period of years, we suggest, would be desirable.

Shri B. K. Das: For new entrants?

Dr. S. Husain Zaheer: Perhaps, you can.

Mr. Chairman: Do you think there is sufficient arrangement for basic re-

search in India in the laboratories under your control. You know all process research is a result of basic research.

Dr. S. Husain Zeheer: We are not equipped properly for some sophisticated type of research like space research, or some very expensive type of nuclear and atomic research, but for other types, I think our Indian laboratories are reasonably well-equipped. Some of the University laboratories also, but not all. My personal view is much more basic research is required to be done, particularly in the Universities, especially in fields like Mathematics and things of that type. CSIR is spacially convening a conference in October where we are inviting brilliant mathematicians from all over the world who have spread out and gone away to come and discuss with us and recommend to us what method should be adopted to encourage the study of Mathematics and methematical research in the country, because we feel this is the basis of all physical research. For actually all types of science, Mathematics is the basis.

Mr. Chairman: Is there close liaison between the University CSIR and the University Grants Commission?

Dr. S. Husain Zaheer: There is no formal liaison with the University Grants Commission. Our Reviewing Committee had recommended formation of a Liaison Committee between the University CSIR and the University Grants Commission, but the Univedsity Grants Commission was not particularly favourable to that idea. Because of the reluctance from the U.G.C., we have dropped the idea of forming a formal committee. We have got a kind of Expert Committee on which representatives of CSIR and some University Science Professors sit together and advise us how collaboration could be developed. But there are any fields—for example about 70 per cent of scientific research in the Universities is financed by the CSIR—these schemes of research are approved by Research Committees of the CSIR where predominantly professors from the Universities are members. It is they who sanction research schemes in the Universities. Then we give a very large number of research fellowships which are mostly in the universities—nearly 80 per cent are in the universities. These are meant to induce people to take up science as a career and for training in resarch, because we feel that unless brilliant students take science as a career and get training in research, our talent will be dried up. Also a number of CSIR laboratories are recongnised bases for Ph.D. work and also a number of CSIR laboratories actually do regular teaching work in special branches of technology for neighbouring universities.

Mr. Chairman: What is the progress that the CSIR has made in its laboratories regarding import substitutes and export promotion.

Dr. S. Husain Zaheer: We have tried to reorient all our programmes. We must say that to some extent we have attained success. But we are still moving forward. After all, I do not want to be in the defensive. but I feel that science is rather new in India and at least the interest in the investment in science is even now not quite adequate. It is something about which we may not feel complacent but we cannot also feel apologetic. I think we have, on a rough calculation which was made about two years ago, saved the country about 22 crores of foreign exchange, which, of course, is not very much, considering that our annual budget now is Rs. 17 crores. But still it is only indicative of the manner in which we are moving forward and we feel that if we make this calculation four years hence this figure would be more than doubled.

Mr. Chairman: How are these problems taken? Are they referred to by the Ministry or the laboratory takes them on its own?

Dr. S. Husain Zaheer: Each laboratory takes up its own problems. Of

course, as I mentioned to you earlier, we have established a coordination—a liaison—unit, which establishes contacts with the technical Ministries of the Government of India. They are regularly in touch with their corresponding industry both in the public and private sectors and the administration. Then in our scientific advisory committee and executive councils of the laboratories as well as in our Board of Scientific and Industrial Research, we have representatives of private sector industry, public sector industry and Government economic and technical Ministries. So, in this way we try to pick out the problems which are of interest to industries and then based on the results of our research the industry, both in the public and private sectors, have their utilization. Also, the industry asks us to do any particular type of research in which they are interested.

Mr. Chairman: Coming to the Patent Bill, we have for other patents 14 years, for food, chemicals we have 10 years. One argument advanced before us is that even the 10 years period is too small and unless we give 4 to 5 years for technical know-how to be translated into industrial production, afterwards it will only be two to three years left. If we reduce the period, no benefit will come to India; we will not be able to get any knowhow from the advanced countries. What is your view?

Dr. S. Husain Zaheer: As I have suggested earlier, Sir, the period could be reduced from 10 years to 7 years. I do feel that if there is any patent of the kind of 7 years period, it will ensure a reasonable return. I am not particularly enamoured of foreign firms investing in our pharmaceutical industry. And they will be pharmaceutical or food or chemical industries generally, except one or two cases where we have not adequate technique. If the patents are removed I can assure you that we will be in a position to develop the knowhow, manufacture, etc. with our own resources. Only the profit will be less; it may not be 30 or 50 per cent. Our expenditure on development will not be 70 to 75 per cent, but prices will definitely come down at least for life-saving drugs. We will be able to meet the situation particularly if patents are also removed from the intermediates, because intermediates are important and we can manufacture intermediates also connected or required for the manufacture of these drugs or chemicals, on which you are proposing to apply this Act.

Mr. Chairman: Do you want 7 years from the date of specification, of the date of sealing?

Dr. S. Husain Zaheer: Date of application; the date of filing the complete application.

Mr. Chairman: There are three dates—date of application, date of specification and date of sealing.

Dr. S. Husain Zaheer: Date on which complete specifications are filed. That would be considered as the date of patent. 7 years from that time.

Shri R. P. Sinha: I wanted to know from the learned witness if he has given his thought to this problem. He is an eminent scientist of our country. I would like to ask him about purely scientific aspect and connected with pure research. You see we have now established very many research institutes all over India and you are coordinating in the CSIR. You have got a buget of Rs. 17 crores. I undersand there are two types of research: one is basic research and the other is applied research. Now, we would like that the process of research should be quite substantial, although it is difficult to force the pace of research, as I understand it. But we would like some tangible results. But there is another aspect and that is we would like to know how much commercial use we can put to our research that is being done. Now, you have taken about 200 patents out of that. 200 are being

commercially used. Is it possible that at least in time to come a part of our research expenditure could be met from the income, from the research work on patent? You can say that I do not believe in that; research should be financed by the State. Now, in the debate that is going on we say that public sector factories must pave their way; they must be commercially profitable. I am not talking of the basic research; I am talking of applied research. The community is paying for that applied research work. The community is entitled to ask from this organization how much you are giving to the community by way of concrete results. Now, could you give us some idea how applied research could become self-sufficient, or at least a good portion of it is self-sufficient while that is being exploited by the country.

Dr. S. Husain Zaheer: I think it can do. I can give you one example of a laboratory where I worked for 16 years which is now earning nearly 30 per cent of its revenue expenditure through receipts but not from royalty and others also. That is also a small part. But it gets its receipts from fees for doing certain work and from selling some specialised products which it makes. I am strongly of the opinion that the applied research can to a very large extent be made self-supporting and should be made self-supporting.

Shri R. P. Sinha: Do you think we should limit our research more particularly to basic research to the public sector, that is Government laboratories financed by the State, or do you want extension of research in the private sector as well?

Dr. S. Husain Zaheer: I would not lay hard and fast rule. During the last 7 or 8 years, CSIR has been actively assisting in the development of scientific research by private industries by the formation of cooperative research associations. We have 8 such active associations in the country today where the expenses are shared. 50 per cent is shared by the members of the association, that is, by private industry, and 50 per cent is shared by CSIR While I am in favour of encouraging this, as has been pointed out in our third reviewing committee report which we have drafted, our technological development or the interest or support to research has not been so much developed to an extent that we can rely on private enterprise, to support it to the extent that it is required for the economic and industrial development of the country.

An hon. Member: Is it project orientated?

Dr. S. Husain Zaheer: All programmes of CSIR laboratories as well as cooperative research laboratories are project orientated.

Shri R. P. Sinha: In other countries there are some research organisations which finance such research projects or research as a whole without any motive of compensating for all the expenditure on research. But I understand that some of the investment on research is on the basis that they will become commercially exploitable. The inventions will become commercially exploitable and therefore they will recover back the investment on research. Now, this we are told, is possible only under a patent system. Now if we do not have that—I am talking completely of India—how can the Indian research develop? Parliament is responsible for financing all those things. Take private industry. How can we expect that development to take place unless they are in a position to recover back expenditure on research by investing something which they can commercially exploit and recover back?

Dr. S. Husain Zaheer: I do not think that it is necessary to patent the process before you can commercially exploit it. It is possible to commercially exploit a process and earn profits, without the necessity of patenting it.

Shri R. P. Sinha: The learned witness feels that research should be

extended and it should be self-supporting. How to do it? I do not think the learned witness is competent enough to answer that question. One more question. When we abrogate patents here, should we not take advantage of patents somewhere else? I wonder if it is possible. There is this question of reciprocity. An American firm is willing to pay 7½ per cent for heymicin of Pimpri; the USA Government is not according sanction to it. USA Government is not prepared to grant that because they are looking to what we are going to do here. I wonder if the witness is aware that there is always a question of reciprocity. If we abolish patents here, we can't take advantage of what is there somewhere else.

Dr. S. Husain Zaheer: I am not aware that such reciprocity is obligatory. However I am prepared to forgo the advantage in the present stage of our development because the gains we are likely to get will fall out in place of the losses which we might suffer.

Dr. C. B. Singh: If the research work in each and everyone of your national laboratories is problem or project orientated, will it be helpful?

Dr. S. Husain Zaheer: I agree with you. They are now project orientated in almost all our laboratories. Allocation of funds, time-limit, time-target of equipments required, all are project orientated. I would submit to you some of the reports of the laboratories.

Mr. Chairman: You said that the tribunal will avoid delays? What do you suggest as the composition of the tribunal? Suppose the committee recommends such a tribunal. What would you suggest to be its composition?

Dr. S. Husain Zaheer: I would like to leave it to the Ministry because the cases might vary from one to the other and therefore the type of scrutiny might also differ between one and the other. I would not like to have a permanent tribunal.

Mr. Chairman: You do not want a permanent tribunal. Would you like to have an ad *hoc* tribunal?

Dr. S. Husain Zaheer: Yes *ad hoc* tribunal for specific groups of cases.

Mr. Chairman: Thank you very much.

Dr. S. Husain Zaheer: Thank you.

(The witnesses then withdrew)

(The Committee then adjourned)

MINUTES OF EVIDENCE GIVEN BEFORE THE JOINT COMMITTEE ON THE PATENTS BILL, 1965.

Friday, the 26th August, 1966 at 14.40 hours.

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman.*

MEMBERS

Lok Sabha

2. Shri Dinen Bhattacharya.
3. Shri Bibhuti Mishra.
4. Shri P. C. Borooah.
5. Sardar Daljit Singh.
6. Shri Basanta Kumar Das.
7. Shri V. B. Gandhi.
8. Shri Kashi Ram Gupta.
9. Shri Prabhu Dayal Himatsingka.
10. Shri Mathew Maniyangadan.
11. Shri Bibudhendra Mishra.
12. Shri Chhotubhai M. Patel.
13. Shri Naval Prabhakar.
14. Shri Sham Lal Saraf.
15. Dr. C. B. Singh.
16. Shri K. K. Warior.
17. Shri Balkrishna Wasnik.

Rajya Sabha

18. Shri Babubhai M. Chinai.
19. Shri D. P. Karmarkar.
20. Shri Shyamnandan Mishra.
21. Shri R. P. Sinha.

REPRESENTATIVES OF THE MINISTRY OF INDUSTRY

1. Shri K. V. Venkatachalam, *O.S.D.*
2. Shri B. N. Atrishi, *O.S.D.*
3. Dr. A. Joga Rao, *Controller General of Patents, Designs and Trade Marks.*

REPRESENTATIVE OF THE MINISTRY OF HEALTH

Shri S. K. Borkar, *Drug Controller of India.*

REPRESENTATIVE OF MINISTRY OF LAW

Shri R. V. S. Peri Sastri, *Deputy Legislative Counsel, Legislative Department, Ministry of Law.*

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. Directorate General of Technical Development, Government of India, New Delhi.

Spokesmen:

(1) Dr. B. Shah, *Industrial Adviser.*

(2) Dr. P. R. Gupta, *Development Officer.*

(3) Dr. S. S. Gothoskar, *Development Officer.*

II. Dr. M. L. Dhar, *Director, Central Drug Research Institute, Lucknow.*

I. Directorate-General of Technical Development, Government of India, New Delhi.

Spokesmen:

(1) Dr. B. Shah, *Industrial Adviser.*

(2) Dr. P. R. Gupta, *Development Officer.*

(3) S. S. Gothoskar, *Development Officer.*

(The witnesses were called in and they took their seats).

Mr. Chairman: Gentlemen, these witness are Government witnesses. They cannot give any opinion on the Bill. They have been summoned here only for factual information. So, I would request you not to place them in an embarrassing position. You can ask only factual information from them.

Shri K. K. Warior: Whichever question is not in order, you will please let us know.

Mr. Chairman: Gentlemen, whatever evidence you give here will be public and it will be given to our Members and laid on the table of the House. Even if you want any particular answer to be confidential, that will be printed, published and given to the Members of Parliament. Now, you can give your opinion if you have any on the Bill. Afterwards, our Members will put to you some questions

Dr. B. Shah: I have no opinion to offer on the Bill. I have already summitted to the Committee the answers to questions sent to me.

Shri Sham Lal Saraf: I have seen a report complied by Dr. Shah which is very much appreciated. Keeping in view the idea behind this Patents' Bill that is on the anvil at the moment, I would ask him two or three questions.

He is known to the Industry and is known everywhere. May I know, keeping in view the know-how in which we have a great paucity in the country to-day and which we mostly import, how the Technical

Directorate of the Ministry of Commerce and Industry, at the moment, is able to help the country in knowing more and more about the technical know-how in the pharmaceutical industry?

Dr. B. Shah: The technical know-how is very much different from laboratory processes and or specifications in patents and so on. The technical know-how is developed with the technical experience and competence of workers in the country. It very much depends on them, to translate these laboratory processes into commercial production. We have to gain more experience in this field. In fact we have been fortunate to have contacts with the many advanced countries of the world since a long time and we are progressing towards that direction. By gaining more experience in traslation of processes to commercial exploitation, in the form of pilot plant operations, semi-commercial operations and also in the erection and construction of large-scale units this technical competence and experience will improve.

There is a considerable need for more experience in this field. With the development of the industry, this is slowly coming up and the people are also getting considerable experience by working with the firms abroad and with the technical collaboration with these firms and also during the process of construction of factories.

Shri Sham Lal Saraf: The Directorate of Scientific and Industrial Research has a net work of laboratories in the country. May I know if his Directorate is in a position to coordinate the different efforts and the different processes evolved in the Drug Research Laboratory in order to make the know-how or the process available to the entrepreneurs or any people who would like to go into the business? And when these inventive processes are passed on to the persons concerned whether in the factory or in the field, do you see whether the pilot project has actually been put up in some of the laboratories in order that the finished end-product can be taken up for commercial production?

Dr. B. Shah: This is developing in our laboratories. In fact as I have already mentioned this is the main lacuna now in our research in the country. Industries also have research laboratories where similar work is being undertaken. For example, you might have heard of the Vit. C. project which was recently worked by the N.C.L. All the process details were worked out by that laboratory. But it has taken 2-3 years for H.A.L. to translate it into commercial production. Hindustan Anti-Biotics is now in a position to design and build a large plant. But this gap in our research effort has to be bridged. Now, the National Laboratories themselves are trying to put up their own pilot plants to make their processes more commercially feasible and acceptable to the industry.

As far as licensing is concerned, we see that whether there is a local know-how available of equal competence, it is given preference to any foreign know-how, for putting up units in the country.

Shri Sham Lal Saraf: Keeping in view the stage that we have reached and also keeping in view the fastness at which the modern scientific world is going, do you consider that the import of know-how is necessary and might continue for some time more to come? If that be so, may I know for what period these patents should be permitted? What should be the duration of patents?

Dr. B. Shah: If we have to go forward and catch up with the rest of the world, we certainly need to import technical know-how and construction and design facilities for large-scale plants and so forth. Moreover, even in the rest of the world these are progressing so fast that it is very difficult to cope up with them if we start work-

ing on them and trying to investigate what has already been discovered. We would rather use those energies to develop processes and know-how that have not already been developed in the other parts of the world. It is very difficult to say how long it will take. It all depends upon the efforts and also on our scientists and assistance we get from abroad for catching up with the rest of the world.

Shri Sham Lal Saraf: About the period of patent he has not said anything. He is in favour of importing the know-how. Naturally it will come under the Patent Law. What period would you recommend for the duration of the patent? To-day it is 16 years. In this Bill 10 years is suggested. From your vast experience what would you think should be the reasonable period for a process patent or a product patent?

Dr. B. Shah: That would really depend upon the willingness on the part of the collaborators to give us the know-how. When the protection is for a shorter period, I mean, if they are willing to be satisfied with a shorter period and are prepared to give us the latest know-how, then the period is not a very important factor. If they think that the period is too small for them to realise the costs they have incurred on the development of the know-how, then a longer period may be given.

Shri Sham Lal Saraf: We are framing a law. Under the law you cannot have different periods for different people. You will have to treat them all on par. What shall be the reasonable time limit for duration of a patent—10 years or 16 years?

Dr. B. Shah: As we develop our own know-how and there is a free flow and exchange of know-how between our country and other countries —that is what we call, two-way traffic—I think most of these things will become unimportant. It is only where we continue to pay money for the know-how and do not get anything in return, and the know-how we can offer has yet to develop, the period and other things really assume great proportions. But it is mainly the willingness with which we can get the know-how from manufacturers abroad that will decide the actual period that we should fix for protecting the flow of know-how into this country.

Mr. Chairman: That depends upon what amount you are prepared to pay them.

Dr. B. Shah: In other words, it is so.

Dr. C. B. Singh: Dr. Shah with his experience as Industrial Adviser to the Government of India and with our desire for improvement of our industry in all spheres will you please answer one straight question? It has been suggested that complete abrogation of the Patent law will help in this direction? People have come forward and said 'You abrogate the patent law. You will see industry will advance by leaps and bounds.' What is your opinion on that?

Dr. B. Shah: As I just now mentioned, it is the technical base that we develop in the country and the way we use the scientific research made abroad for our industrial progress—that is the most important thing. As long as we do not have this technical base, competent and experienced men to translate into commercial production chemical processes and research work done elsewhere, we will continue to need certain amount of assistance, at least till we are able to reach the same level of competence as that of the other advanced countries.

Dr. C. B. Singh: In short, you do not agree with that view?

Dr. B. Shah: I don't think so.

Dr. C. B. Singh: Quite right. Now how can you remove this lack of experience for translating laboratory processes to what you call actual products? This is our weakness. The laboratory processes we know but to bring out, as a commercial

proposition, the products and put them in the market, lack of experience comes there. How can we remove this lacuna? You are an Industrial Adviser; you should be able to tell us.

Dr. B. Shah: We are now depending a good deal for this sort of translation on people who have gained a certain amount of experience of large-scale production, construction of factories and designing of plants and factories abroad. In fact there have not been many many facilities in the country to acquire it. We would certainly need a large number of people of this type who actually will be the future builders of our industry and we would certainly need assistance for training in this field by people who have had this experience or by giving them facilities to gain this experience abroad.

Dr. C. B. Singh: Modern countries like Germany or Japan—I am told—are very highly advanced and you agree that by the end of the last World War, they were completely razed to the ground. Could you tell us how these countries have made such phenomenal advance in the industrial field?

Dr. B. Shah: This is very easy, because the people who really build the industries were there. Although the factories were destroyed, the men who had this technical competence to design and build plants were there. It is not merely the processes and factories that decide ultimately our competence in industrial development. The young men who are now working in the modern units and who are bringing modern technology into this country and who are playing a very vital part in building up of factories—they are the builders of our future. It is not merely dependent on the laboratory workers, the people who are doing experimental research work in the laboratories, but on those people who are doing work in the factories in India and abroad and have brought with them all the experience of modern technology with them. Even if the factories are razed to the ground, they will be able to duplicate the equipment and build the factories again and with their experience regenerate the whole economy.

Dr. C. B. Singh: Do you think that foreign capital and foreign equipment and plant both in Germany and Japan played an important part in this direction?

Dr. B. Shah: Some resources in men and material might have helped; but the main builders are the competent technicians and scientists which they already possessed which we don't possess to the same extent.

Dr. C. B. Singh: You said that for quite some time we will need foreign know-how and foreign experience. What can we do to attract this foreign know-now to this country?

Dr. B. Shah: There are many ways of attracting this know-how. Government already has a policy in this matter. We have allowed considerable foreign participation. We have paid technical fees for bringing in processes, design and other work and also protected them so far against . . .

Dr. C. B. Singh: Supposing we make the patent law very weak, will that attract foreign know-how?

Dr. B. Shah: I think that is for you to judge.

Dr. C. B. Singh: No, no. You are an industrial adviser and this is a very important and simple question. We want a clear opinion from you on this point.

Dr. B. Shah: In this connection, I would refer you to the report of the ECAFE when certain studies were made for the ECAFE region countries South East Asian countries—and some of the difficulties were discussed by the ECAFE conference about their trying

to get know-how for ther development. Some of them are even prepared to pay quite a handsome amount of money for technology and so on. But it was felt by the committee that since they did not have proper patent protection, they would not be able to attract really good know-how and one of the recommendations was that they must first protect the know-how before they can attract foreign know-how.

Shri Prabhu Dayal Himatsingka: You said that we will require technical know-how to catch up with the rest of the world. That is to say, you think that getting the know-how will be more convenient for us than to start finding from scratch?

Dr. B. Shah: Yes. If we try to cover the ground that has already been covered in other countries, we will always remain behind because they are progressing now in geometrical progression in the field of science. If we go on trying to cover what has already been covered in science, all our scientists will be employed in that kind of work, but if we get the technology that has already been developed from other countries, our present resources can be used for further progress and for maintaining our level of industrial growth as in other advanced countries.

Shri Prabhu Dayal Himatsingka: Supposing the patent of a product expires. Ordinarily, is it easy or difficult to manufacture that product without getting the know-how from the party?

Dr. B. Shah: There are two ways; either you have to work out your own know-how or you have to get it from the party. As I said already, for working out the know-how, you need a considerable amount of technical competence and experience and till that is developed, it will be much easier to get it from the parties straightway rather than waste several years trying to work out what the party has already got.

Shri Prabhu Dayal Himatsingka: Therefore, the expiry of the period of a patent, in itself, will not be of much use unless we have got competent persons who can do the follow-up work?

Dr. B. Shah: Yes, Sir.

Shri K. K. Warior: May I know whether Technical Development has got an advisory body?

Dr. B. Shah: We have got a development council.

Shri K. K. Warior: Who are the members of the development council?

Dr. B. Shah: There are about 30 members and the Chairman is Mr. A. V. Modi. In that council, there are representatives of owners of industrial undertakings, technical men in the undertakings, representatives of consumers, representatives of trade (chemists and druggists) and labour representatives.

Shri K. K. Warior: What is the any discussion on this Patent Bill in your council?

Dr. B. Shah: Yes, Sir.

Shri K. K. Warior: What is the general consensus?

Dr. B. Shah: The council has always recommended that the patent is very necessary for the development of industry.

Shri K. K. Warior: You want a stricter or a weaker law?

Dr. B. Shah: They have not gone into the details, but generally they have supported it.

Shri K. K. Warior: What was the consensus about the existing Act and the present Bill? Was any difference felt or. . .

Dr. B. Shah: Unfortunately during this period *i.e.* after the Bill had

come in, it has taken a lot of time for the council to be reconstituted. Only recently it was reconstituted and they didn't have much time to discuss these aspects.

Shri K. K. Warior: Generally, are they for or against this patent law?

Dr. B. Shah: Generally, they are for this patent law.

Shri K. K. Warior: Any representatives of the Government undertakings in this council?

Dr. B. Shah: Yes.

Shri K. K. Warior: What is their opinion?

Dr. B. Shah: I think you interviewed some of the representatives of the Government undertakings recently.

Shri K. K. Warior: What is their opinion according to your knowledge in your association with the council?

Dr. B. Shah: Well, Sir, some of the industrial undertakings have done very well and they have taken out patents for some of their drugs discovered in their research laboratories. I feel they would naturally be for patents. They have taken world patents for some of their drugs which earn very good foreign exchange for the country.

Dr. C. B. Singh: What is the total number of such patents?

Dr. B. Shah: There are about two or three drugs for which they have taken out world patents. The recent one Antiamabin, is going to be most fruitful because the terms offered are very good.

Shri K. K. Warior: I understand from some source that our Government pharmaceutical industry is not fully represented and their views are not taken into consideration in the development council. Is that a fair criticism?

Dr. B. Shah: No, Sir, the Managing Directors of both public sector pharmaceutical industries are there.

Shri K. K. Warior: But the views of those who are not falling in line with the general thinking in the council are not taken into consideration?

Dr. B. Shah: That is not correct. We always send the minutes for circulation and the dissenting views will also be recorded.

Shri K. K. Warior: You said that the general feeling in the ECAFE was that unless protection is given for the know-how, know-how will not come into this country.

Dr. B. Shah: Yes.

Shri K. K. Warior: Now, how can a patent law give any protection to know-how?

Dr. B. Shah: Probably the feeling was that once a know-how is known anybody can use the patent and the know-how can pass on from one party to another, who has not paid for the patent.

Shri K. K. Warior: Is not the know-how quite different from what is patented?

Dr. B. Shah: Yes, Sir. They are two entirely different things.

Shri K. K. Warior: How is it that a patent law can protect the know-how? Know-how whenever it comes is known and it can be given. Only the process or the product can be protected.

Dr. B. Shah: But the other man can't undertake production without infringing the patent although he may have the know-how.

Shri K. K. Warior: Now we are providing patent right only for the process. Suppose there is a new process through some new know-how. Is that to be excluded?

Dr. B. Shah: If we are only going to have process patent. Certainly other processes can be worked. There is no restriction at all.

Shri K. K. Warior: Then where is the question of protection to know-how. Proection to know-how with regard to a particular process, that is all the protection. According to the Development Council and your knowledge, how much of our development has been blocked by this existing patent law. Has it blocked also the development of technical know-how in our country?

Dr. B. Shah: Sir, as I have already mentioned, development of the industry has been mainly handicapped for want of this technical competence to translate processes and even our own laboratory processes to commercial production. This is playing the main part in our not having been able to catch up with the rest of the world. Other aspects are very minor.

Shri K. K. Warior: Now we are told that at least in the drug and pharmaceutical industry, we have almost 99.9 per cent know-how and we can manage without any form of foreign collaboration.

Dr. B. Shah: It depends on the product. Where the processes are fairly simple that we can develop with our existing competence, we have put up plants without foreign collaboration, but where the processes are more complicated, where several steps in the reaction are involved and where even a small fall in yield in each stage would mean a considerable increase in cost, we have had to take know-how from abroad.

Shri K. K. Warior: When a process or a product is available by paying a lump sum which can be realised from the consuming public, is that not creating a sense of complacency even amongst our own industrialists and investors not to go in for all these expenses on research and for our own inventions and development of know-how. Now sugar is available from foreign markets at a cheaper rate. If we take it, there is no necessity for developing our own sugar industry and loading the consumers with all the prices. The Bill is essentially intended for our own research development and development of our own technical know-how and our own industry.

Dr. B. Shah: There is some protection of the industry. If we produce something, we naturally prevent it from being imported and a competition being set up within the country. Somebody may be prepared to dump sugar in our country and kill our industry. That is the sort of protection which pharmaceutical and chemical industries are getting today. When anybody develops his own process and puts up a factory, we see that it is not being prised out by somebody bringing in imports and ruining the industry. That is what has been the object of the present import regulations and the Industries Development and Regulation Act.

Shri K. K. Warior: We have provided in the Bill that Government can in spite of all the patent rights import whenever there is an emergency or whenever there is a critical situation in the country like epidemic, drugs for the consumption of the country. Do you think that this patent right must be given to those industries which are only importing either in the form of the last stage or an intermediate stage just to cover the provisions of the law and then having it packed here and given to the consumer. Can we not block it? Why should we give that protection?

Dr. B. Shah: Whenever we set up a production unit here, we see that it is not just from the penultimate stage, but there is a regular development from basic raw materials which should ultimately become available in the country. That is the object of the Industries Development and Regulation Act. Most of the industries set up have been based on basic raw materials that we are either producing in the country and are ultimately going to produce.

Shri K. K. Warior: Is that the case in the pharmaceutical industry?

Dr. B. Shah: Yes, Sir, we have achieved basic production in most of the products.

Shri K. K. Warior: I am a layman, I do not know, but those people who are in the know of things, especially those engaged in the pharmaceutical industry in the private and public sectors have complained that only the penultimate stages are coming here and we are paying through our nose for the intermediate stages and only packing and labelling is done as a matter of fact, and the reason is that the patent law is giving the protection. What is your experience?

Dr. B. Shah: Pharmaceutical industry initially developed by merely processing imported bulk drugs. That was the first activity. But progressively during the last 8 to 10 years, Government have followed a regular policy of encouraging basic manufacture within the country. As you might see, substantial portions of the drugs are being made in the country from basic chemicals and intermediates and we are also setting up units to produce these very intermediates, because these intermediates cannot be made by the pharmaceutical industry; they come within the purview of the chemical industry. So we are setting up units to produce these intermediates in separate units. Actually we are bulking up the demands of other allied industries like dyes, plastics, rubber chemicals, and so on, so that we could have economic units for manufacturing these intermediates to feed these industries. As you might see, for nearly Rs. 18 crores worth of bulk drugs that we are producing, which are being processed into finished pharmaceuticals, we are importing only about 2½ crores worth of intermediates. It has been planned that HOC will produce nearly 1½ crores worth of intermediates required by the drug industry. The synthetic project in Hyderabad will produce a crore worth of intermediates. The fertiliser plants will also produce certain solvents and this alongwith the production from petro-chemical complexes, the balance requirements will be met. Then there are private chemical industries which are coming up with production of several required items. We have planned in India production of basic pharmaceuticals from intermediates and basic chemicals in the pharmaceutical industry. We have planned production of these chemical intermediates in the chemical industry. These two activities have been dovetailed. It is only when it is uneconomic to make goods (our demand being low) that we may continue to import. Where we feel that we should certainly not burden the industry with very expensive intermediates made in small quantities, we may continue to import them and pay for them by means of export of items which we can make more economically and in which we can compete in the world markets. For example we have developed our export of plant products to nearly 1½ crores. That is last year's exports. We have put up units which make the intermediates for hormones from plants which are growing widely in the Himalayas. We have put up recently for Menthol a unit which is going to export nearly 25 lakhs worth of Menthol from this country. Where we think we are in a more suitable position to produce and compete in the world market, we are concentrating on those lines rather than on items where we find we will always be out-beaten in price by other countries which have various other facilities. We have got varying climatic and soil conditions. We can very well produce a number of plant products. India is known as the botanical garden of the world. Our approach in planning has been to produce only the intermediates which we can make economically at competitive prices and produce more of them so that we can export them to the world markets.

Shri D. P. Karmarkar: In respect of industrial development in general, and the drug industry in particular, is it more often that we have gone

to them to make offers or they have come to us and made offers? Which is the trend?

Dr. B. Shah: This is where the Industries Development (Regulation) Act comes into play. In some cases people have come up for making some profitable items from their side. We have had people who come up with projects that are more economical for us and which will help in the development of our industry. We have screened these offers when they come to us. In some cases we have persuaded them to come up with schemes where we felt that they will be helpful to us. Indian Investment Centre is doing a good deal in this respect and we give them from time to time items for which we need collaboration and the lines of development that we need. So this has been more or less a very regulated development.

Shri D. P. Karmarkar: I appreciate that. Coming to the drug industry, can we say it is fifty-fifty?

Dr. B. Shah: Yes, it is both ways.

Shri D. P. Karmarkar: Has it been our policy in the past, other things being equal, to invite foreign collaboration and develop our industry, particularly drug industry, as early as possible? Has it been our own anxiety?

Dr. B. Shah: Wherever there is equivalent skill available in the country our own scientists have been given preference. Where we wanted the know-how, the technology or processes and so on, we have had to invite people from outside.

Shri D. P. Karmarkar: I put it like this: Had it been our anxiety during the last ten years, particularly during the last five years, to speed up as much as possible our industrial development and the drug development?

Dr. B. Shah: That is certainly true.

Shri D. P. Karmarkar: Have we been seeing to it that as much of our advantage should be protected as possible with foreign collaboration?

Dr. B. Shah: Yes.

Shri D. P. Karmarkar: In cases where we thought it was not so, have we rejected that?

Dr. B. Shah: Yes.

Shri D. P. Karmarkar: So far as our own law is concerned, have you any suggestions to safeguard our interests as much as possible in respect of the return that we may give to the foreign collaborators?

Dr. B. Shah: After all, most of these are foreign agreements. There have been various committees of Government known as the Foreign Agreements Committee, Capital Goods Committee, which have been mainly concerned with the objective to see that the payment is not excessive, compared to the return that we get and all these aspects. We have the Industries Development (Regulation) Act and various regulations. It is ensured that they get a reasonable return.

Shri Babubhai M. Chinai: Will you kindly refer to your answer to question 5(b)? Will you explain more clearly what you mean by "technical base"? How far the country has acquired modern technology to build the industry on its own?

Dr. B. Shah: Sir, by "technical base" what is implied is the technical competence and experience of the workers to be able to work out the necessary details on their own to make a process commercially successful. In other words, it is the experience for translating the process specifications or even laboratory processes developed by research laboratories into commercial production. In comparison with advanced countries we are lagging behind in this respect.

We should be able to produce all items where comparatively simpler techniques are involved without much foreign assistance, but where more complicated techniques involving a large number of steps are involved it has been necessary to obtain collaboration for establishing commercial production.

Shri R. P. Sinha: I would refer the witness to the statement which he has given along with his replies on the question of First Five Year Plan targets. He has also given the Fourth Five Year Plan targets. He has also explained the shortfalls that have taken place in some of the items. And mostly I find that this is due to the fact that the public sector units have not gone into production. So they have to lag behind. Then am I to conclude from this that so far as the targets set for the private sector in the pharmaceutical industry are concerned, they have been achieved?

Dr. B. Shah: Sir, it appears from the statement that the public sector has lagged behind very much but this is because most of its units are nearing completion and there has been some marginal delay in getting into production within the plan period due to various factors. And it has happened that most of the private units have come up but here are also cases where there have been delays and they are also completing their construction work by the end of this year.

Shri R. P. Sinha: I want to refer to anti-leprotic drugs for which you have given "Production was low as under assistance programme considerable amount of this drug was being imported."

Dr. B. Shah: It means that certain quantity of this drug was given probably very cheap or almost free by UNICEF. This is a peculiar Phenomenon for the market of this drug. In this case it is not a leper who goes to purchase the medicine in the market but some Leper Associations or some Philanthropic bodies which buy and UNICEF supplied large quantities to the Government and hence the capacities were not fully utilised as these were being probably distributed free.

Shri R. P. Sinha: Isn't it proper that we must develop the production from these units so that we may become self-dependent? How has it lagged behind?

Dr. B. Shah: As I have already said the capacity is there and they can always produce whenever required. They produced it to a particular stage so that whenever time comes they can convert it within a short period to the finished product.

Shri R. P. Sinha: In reply to question No. 1(f) you have said "The value of production of bulk drugs is estimated at Rs. 18 crores|annum. This along with an import of bulk drugs of Rs. 7 crores is processed to finished pharmaceutical preparations with a sale value of Rs. 150 crores." Now I would like to point out Rs. 18+Rs. 7 crores come to Rs. 25 crores. Now Rs. 25 crores worth of bulk drugs is valued at Rs. 150 crores drugs so far as sales is concerned. This appears to be a very high proportion. Now, is this a correct thing? Have you made proper technical assessment that the same values are correct or do you think there is good deal of profiteering in this sale.

Dr. B. Shah: There is considerable amount of work that is undertaken between a bulk drug and its conversion to a finished drug. It costs considerable amount of money in the from of other ingredients, maintenance of aseptic conditions and various manufacturing operations to convert bulk drugs into dosage forms. In this case the margin might be about 5 to 6 times. It is quite low as compared to other countries. If it is an injectible preparation the mark-up is very high—it is about 1 to 10. If it is tablet it is hardly 1

to 2. 1 to 5 is an average. It includes packaging, the cost of glass bottles or vials with aluminium seal, etc. in which the finished product is marketted.

Shri R. P. Sinha: Do you mean to say this also includes the cost of advertisement and cost of educating the doctors.

Dr. B. Shah: Yes, Sir. Certain kinds of promotional expenditure are also included in the cost.

Shri R. P. Sinha: Have you studied whether this mark-up is reasonable and the people who are manufacturing are not profiteering? What is your system of checking up these things? How do you check up that marking up is correct?

Dr. B. Shah: Before a licence is given to a firm these prices are also looked into now. Actually they are asked to give full details. Various break-ups are given by them and they are being scrutinised by the Government.

Shri R. P. Sinha: Do you mean to say the manufacturers cannot put up their prices and they have to get the sanction before they can sell at a particular price?

Dr. B. Shah: It is so now.

Shri R. P. Sinha: It has been represented to us by many witnesses and also the Drug Controller has circulated to us a statement of prices in which it is alleged that the prices of these products in India are very high and we are also told that the manufacturers are profiteering. Mind you, they are not making profits but they are profiteering. What you say is contrary to the above. You say you keep a control and, as such, do not allow the prices to be charged over and above what you give them authority to charge. How shall we reconcile the two points of view? Secondly we are told that even in a country like Pakistan the drugs are very much cheaper than the drugs sold here. Could you give us some information as to whether the prices are reasonable? Secondly, why the prices in this country are higher than Pakistan? Have you checked up the customs duty and excise duty in Pakistan? Let us know the correct position and comparison of prices in these countries.

Dr. B. Shah: I have not received this statement. I will check up and let you know. You can always make a statement by selecting a few things where others prices are lower and ours are higher. It is a very fallacious thing. You have to see the general trend of cost of drugs of the entire range of products and by mere selecting a few and getting a statement prepared you can prove anything you want.

Shri R. P. Sinha: Mr. Chairman, I would like to repeat to you one thing that all the cost statements that have been given to us, so far as prices are concerned, are from two sources—One from the witnesses, foreign and Indian, they have given to us the prices obtaining in India and outside. Two sets of such figures have come to us. One set of figures tell us that prices are cheaper in India. The other set tells us that these prices are very high in India. The other point is his telling us that the prices are very costly. The Drug Controller has given to us some statements showing that prices in India are very much higher than prices in Pakistan. As technical expert of the Government Mr. Shah may please give us a proper assessment so far as this aspect is concerned. I request you that all those figures given to us may be sent to Mr. Shah. He has promised to give us his own assessment. This may be sent for his proper notation on each of these things. He may give us his considered opinion on this aspect of the question. In reply to Q.4(a) you have said that in case of finished drugs, the committee has observed that the cost of basic drug is high in India; but the cost of

finished preparation is much less than in foreign countries. What is this about?

Dr. B. Shah: This is the finding of one of the committees of the development council, the technical sub-committee of the development council. They have given these figures. They have compared with other countries, Italy, UK, USA and so on. This is the conclusion which they have drawn which I have quoted here.

Shri R. P. Sinha: Were you a member?

Dr. B. Shah: Yes.

Shri R. P. Sinha: Do you stand by this report?

Dr. B. Shah: This appears to be....

Shri R. P. Sinha: We would like to have the details. You have given the conclusion only. What are the details from where you have drawn all these conclusions?

Dr. B. Shah: These are given in the Report. I have got a copy of the Report.

Shri R. P. Sinha: Sir, we would like to have all these things sent to us in cyclostyled form or in whatever manner you like. Members may like to study on those facts. For that we should have the factual data.

Dr. B. Shah: I have already given.

Shri R. P. Sinha: What is the page number?

Dr. B. Shah: Page No. 21.

Mr. Chairman: This is different.

Shri R. P. Sinha: Let it be circulated to us. On behalf of Shri K. K. Warior, I want to ask one question. What is the meaning of the word 'International price'? Is there anything like 'International price'?

Dr. B. Shah: I do not know what is the context in which it is used. We buy certain drugs in the world on tender basis. We get various quotations. This varies from period to period. We buy streptomycin on world tender basis and our prices have varied considerably, sometimes it has gone as low as 105 and it has gone up to as high as 200. It is all a matter of supply and demand in the world market and the price it fetches. It is something that is varying depending upon the supply and demand position.

Shri R. P. Sinha: About the research programmes for basic drugs in our country, are you satisfied that research programmes for basic development of drugs in this country is satisfactory? If not do you think what we should encourage such research in the private sector industry-wise?

Dr. B. Shah: It is very essential for the industry to establish more independent research laboratories to undertake all the three spheres of research—producing new drugs, improvements to existing processes, as well as formulation research. There is considerable work being done on development research with regard to formulations and process improvements. But very little is being done on the development of new drugs. On this sphere, we need a large number of laboratories to come up.

Shri R. P. Sinha: The ECAFE Committee went into it. What is the committee's report?

Dr. B. Shah: These are certain countries which are very much underdeveloped than us. There, the very question of basic manufacture of drugs and even formulating units being set up and things of that sort were taken up. They don't have the personnel to do such advance research yet. Their technology is still far, far, behind. This aspect does not come up to the front in this report. This committee has recommended that research should be encouraged with regard to

plant products that are grown in these countries.

Shri R. P. Sinha: One last question. You say basic research is important. We were told that it requires lot of money to make investment in research. Could you tell if it is possible to attract foreign know-how and foreign capital for research work because I understand that many of these foreign big research units and pharmaceutical companies are negotiating with the Government of India for setting up such laboratories in India? Do you think that they will be attracted to come to set up the research laboratories in India for basic research, if we encourage or plan for that?

Dr. B. Shah: There have been several proposals made by foreign firms to set up independent research laboratories but they are all awaiting the outcome of your report before they finalise their programme.

Shri R. P. Sinha: What do you mean by that?

Dr. B. Shah: They want to see how patent law is going to be amended by you.

Shri B. K. Das: You have given your opinion that progress of pharmaceutical industry in our country depends more on collaboration with other countries. But we have certain Indian companies, advanced companies also which have no collaboration. Is it your opinion that there would be greater progress if they take up foreign collaborations?

Dr. B. Shah: Even some of the Indian companies have been utilising foreign know-how and have availed of this know-how to catch up with the rest of the industries. A firm like Alembic for instance. They have put up a penicillin plant. The cost was high. They did get collaboration from a Japanese firm for improving their methods. They would have been able to solve it themselves, but it would have taken a long time and meanwhile they would have to face uneconomic production. So even these firms which are Indian firms have availed of this know-how by getting into foreign collaboration by getting some assistance on lump-sum payment basis and improved their technology.

Shri B. K. Das: Do you think that there are any provisions in our present Bill which in the opinion of collaboration companies will work as a great disincentive?

Dr. B. Shah: This is a matter of opinion, which I would not like to enter.

Shri B. K. Das: We have provided for process patent and not for product patent. Which one will be more helpful for the successful development of our pharmaceutical industry?

Dr. B. Shah: I would like to be excused from expressing my views on this subject.

Shri V. B. Gandhi: We find that your evidence has been very interesting and it will be of benefit to us. The principal object of this legislation is that the pharmaceutical industry in this country should grow and that we should be in a position to rely less and less on imports. This effort has been viewed in different angles. One set of people thinks that the terms and conditions should be so laid down or so tightened that the payment which we have to make by way of royalties and such other benefits to foreigners should be as less as possible. The other set of people says that we should not tighten our terms and conditions so much that in the process our own people who are to benefit from the provisions of this legislation will suffer. You have of course gone through the Bill. What do you think about the term of a patent? You know what we have proposed? What is your opinion about the rate of royalty? Should the rate fixed be so rigid or there should be a ceiling over it or it should be left to the discretion of the authorities? What I am

really wanting to say is that in the last analysis our efforts should not result in defeating the very purpose, the purpose of promoting indigenous pharmaceutical industry.

Dr. B. Shah: This is a very difficult question, but I would try to answer it in my own way. After all, what we are now trying is to get into the country the technical know-how from abroad. There are different types of know-how, some adopting the latest technology and some obsolete technology. We have to decide what is best for our country and in that respect we should not get lost in the rates of royalties, terms and conditions and things of that sort, because we may not be doing any good to our pharmaceutical industry in getting some obsolete know-how at a low price. We have to weight the various circumstances and after all the know-how is given voluntarily by the party; you cannot force him. You could only use his process, but the know-how is something that comes voluntarily. We have to consider the rate of royalties that exists for different technologies in other advanced countries. This is the aspect you have to consider.

Shri P. C. Borooah: In answer to Question 6(b) you have stated that facilities available in India for Group Research are limited. May I know what, according to you, will be the ideal condition for promoting Group Research in our country?

Dr. B. Shah: Group Research is something new to this country. Few of our industries have put up laboratories for carrying out Group Research. We need organised effort and a number of scientists in different disciplines of science; it needs a huge laboratory, a lot of equipment and a lot of money: There must be somebody who is prepared to spend all the money, even with the chance of not getting any return, because after all the discovery of a drug is a chance; you may spend lakhs of rupees and you may not get anything; on the other hand you may not spend very much and yet get something. It is more a lottery. It is only the pharmaceutical industry that can do this. They can always plan their expenditure in such a way that what they lose in a particular place they gain somewhere else. You cannot expect the Government laboratories to try Group Research in a big way by spending a lot of money with a chance of not getting any result and then answer questions later on. It is not possible for the Government to spend so much money on Group Research.

Shri P. C. Borooah: You say that a number of foreign firms are interested in setting up research facilities, but they are waiting for the decision of the Government on patents. For what decision of the Government they are waiting?

Dr. B. Shah: They probably want to see how the results of their research are going to be protected by this country.

Shri Kashi Ram Gupta: In developed countries, the pharmaceutical industry is on a different footing. The big concerns have got their own basic research arrangements and facilities. In India, we totally lack in that. Either the public sector in our country should do much of the basic research or we should invite foreign firms to put up their own laboratories. You have just now mentioned that these foreign firms are waiting for the enactment of our Patent Law, which means they want to see whether it will be beneficial for them or not. Should we not lay stress on our public sector enterprises for basic research because in the long run that can only pay us?

Dr. B. Shah: It is working both ways. Public sector enterprises are entering the field of research and the private institutions have also produced good results.

Shri Kashi Ram Gupta: I am talking about pharmaceutical industry only.

Dr. B. Shah: In the public sector, the Hindustan Antibiotics have developed several new antibiotics. CIBA Research has developed 5 or 6 synthetic drugs, which are promising. I don't think we should cut off one for the sake of the other. There should be competition from all sectors. Research is a vital thing for pharmaceutical industry and development of research should be given a free scope so that new knowledge may contribute to the supreme effort of ameliorating the suffering of humanity.

Shri Kashi Ram Gupta: The foreign concerns want to come only when it suits them. Seeing to the limited resources in the country the private sector in the country is not able to undertake big research programmes. Such being the condition, the collaboration arrangement also may not work well. In that event also, we have to depend on our own public undertakings. What I mean by this is that we should base our patents in futures more on research done by public undertakings side rather than on the private sector side. That is my point.

Mr. Chairman: He says that it should be based on both sides.

Dr. B. Shah: I do not agree that the pharmaceutical industry as such cannot undertake research. There are big concerns which are certainly undertaking research in this country. There are small concerns which may not be able to undertake research. But, bigger concerns (private industry, can certainly afford to undertake research and they should be encouraged to undertake research. Public sectors also should undertake research. All of them should contribute to the research. There is no special stress to be laid on a particular sector.

Shri Kashi Ram Gupta: So far as the period is concerned, it has much to do with the type of research being done by the concern. Therefore, I am stressing on this point. If we do not get that type of quality research from the private sector, at least, we cannot wait for a very long period. From that point of view, whether the hon. witness is of the view that the public sector undertakings must play a more important role than what they have been playing uptill now?

Dr. B. Shah: There are research institutes run by Government.

Shri Kashi Ram Gupta: No doubt the institutes are run by Government. And more institutes may also be there.

Dr. B. Shah: I think that there is scope for more research institutes being run both in the private sector as well as in public sector. For such a vast country like ours, the research done at present is very limited.

Shri Kashi Ram Gupta: Are our scientists getting their due share in the research in the present set up?

Dr. B. Shah: This is a question on which I have no information.

Shri Kashi Ram Gupta: You have stated that in your Council, formerly, they considered so many points about the industries. May I know whether the point about the period of a patent was also taken into consideration at that meeting?

Dr. B. Shah: All these details were not discussed by the Council at their meeting. It has been reconstituted very recently.

Shri Kashi Ram Gupta: From the period point of view, was this at all discussed?

Dr. B. Shah: They have not considered that.

Shri Kashi Ram Gupta: You have mentioned that units should be fairly large for production purposes. Of course the producers should be seeing to the demand about the consumption of the products. Has it been

analysed as to what should be the basic minimum standards by which a unit can be measured to be economical or uneconomical so far as pharmaceutical industry is concerned?

Dr. B. Shah: There is no yardstick for this. Actually, from my personal experience, I can say when I visited factories in 1956 in Europe I found that a particular product was being produced with a capacity of 50 tonnes. We set up a certain unit with a capacity of 10 to 15 tons with the hope that it could be expounded later on to 30 to 40 tonnes. In 1964, all these units were producing 300 tonnes annum. It is all a question of demand and production. We produce more when the demand is more. But, if there is no demand, there is no use putting up a higher capacity. We have to weigh various factors before establishing the capacity. We have to see whether it is very uneconomical and the production is not too small. We always examine this aspect.

Shri Kashi Ram Gupta: In answer to question No. 6(b) about the facilities that are available in India, you have mentioned the names of the Central Drug Research Institute, CIBA etc., etc. Whether any assessment has been made about the future set up of the institutes in the next Five Year Plan?

Dr. B. Shah: In the Plan to be drawn up for pharmaceutical industry, we have not included the number of research units to be set up. Probably in the Research Department of the Council of Scientific and Industrial Research and so on, they might have planned this.

Shri Kashi Ram Gupta: On page 13 of your replies to the questions, it has been stated that 'cooperative research organised by pooling the resources of a number of firms set up under the auspices of the association is not common in the pharmaceutical industry'. What are the reasons for this?

Dr. B. Shah: Because it is mainly competitive research. One firm produces a product more economically than the other. It will produce a new drug and profit by it before the other has an access to it. There is a certain amount of competition. There are few general problems which these cooperative research organisations can really tackle. It is a question or trial and error. Somebody might have screened 4,000 compounds and spent a lot of money which may not be useful. There are some who might have screened about 400 compounds of which some might be useful. There is a sort of competition between one and the other unit in the industry to have something new. It is very difficult to have a cooperative research. That is the sum and substance of this.

Shri Kashi Ram Gupta: We are judging all these industries on the basis of their being of commercial value. Now, in the future set up of the country, the Government which is wedded to socialism or socialistic pattern of society, might take their help for production of medicines both on the protection as well as on the treatment side. If a large proportion of the population is to be covered by the health insurance schemes, in that case, the commercial aspect of the pharmaceutical industries will have a definite change. Has this been considered by the Government for the future set up at least for the next ten or fifteen years?

Dr. B. Shah: If you are referring to the National Health Schemes of UK, I don't think that it has anyway changed the pattern of prescribing the medicine and treatment. It has not changed the whole set up of the pharmaceutical industry in that country at all. There are a number of private firms as well as government establishments producing drugs and competing with each other.

Mr. Chairman: It has been brought to the notice of this Committee that

certain foreign firms have tried to profit by the exploitation of Indian products such as the Chloromysitin, Tolbutomide and some other drugs. Like that, what is the remedy you would suggest in this Bill to prevent such abuses?

Dr. B. Shah: As far as my knowledge goes, most of the difficulties have arisen when the parties try to import the know-how from the third party and not develop on their own. We have similar problems in India not only for pharmaceutical industry but also in the chemical industries. When somebody develops the know-how, what he actually does is that he makes efforts to get a compulsory licence and goes ahead with the production and waits for results. He is not prevented from doing that. When he has to get a know-how from the third party, probably, it amounts to infringing the rights. Then the difficulty comes in. The other difficulty comes in only where they have developed processes in certain research laboratories and they have not been able to translate them into commercial production due to various lacunae which, I have mentioned, and the people have not been able to get the desired results. These factors have been more or less responsible rather than the efforts of these firms in preventing anybody to utilise any research of know-how locally developed

Mr. Chairman: Is it your opinion that the claim put forward by the Indian scientists is not quite correct?

Dr. B. Shah: No, Sir. I don't say that their processes are wrong. But, they have not been developed to that stage of commercial exploitation which is very essential for any industry to take up. Our country has to overcome this difficulty. Then only our research becomes more useful. It is not very much the patent but it is this aspect that comes in the way.

Mr. Chairman: India is a very large country, has a very large population and the people are poor. It has been brought to the notice of this Committee that foreign firms are only importing the final stage of the product and then perfect it and sell it at a very high price, thereby exploiting the country. What are the measures you are taking to prevent such abuses and to enable the foreign firms to start the manufacture here of the basic products and sell them at reasonable prices and in sufficient quantities to meet the demands of the country?

Dr. B. Shah: We have established production of various drugs from basic stages. I can give you the saving in foreign exchange which will give an indication as to how final products are being made from mainly indigenous raw materials. We have instances where this saving in foreign exchange for bulk drugs manufacture is as much as 90 per cent—where only 10 per cent of the value as raw materials is being imported. Some save 50 per cent; still others in the later stages 20—30 per cent. Government is always seeing that whenever production is established within the country there is a saving in foreign exchange by way of basic production. In other words, the product really becomes available to the consumer in the country at a much lower price in terms of foreign exchange than it would have been available if the product is imported in the final stage. It may be that the prices are higher, but what we pay in the form of foreign exchange is much less. For example, tetracycline we pay only 10 per cent of the imported price in the form of imported raw materials. So we see when the schemes are taken up for production that they are based on as many indigenous raw materials as possible and schemes which had been taken up from the penultimate

stages—most of them—have disappeared by adopting a phased programme which ensures production from more and more basic raw materials. We have also, as I mentioned earlier, taken up the production of these very intermediates to improve further the saving in foreign exchange. Of course, some of the intermediates cannot be legitimately taken up for production in the pharmaceutical industry. Some of these have to be pooled with the requirements of same or similar items required by other industries. If you see this brochure, (IPI booked) on pages 36-37 we have given the various raw materials of the pharmaceutical industry which are at present either being produced by our units or are still being imported. If you see page 36, you will find a much larger capacity has been licensed than what is required by the pharmaceutical industry. Take Acetic Anhydride. We need only 1400 tonnes for the pharmaceutical industry. Its capacity is more than 5,000 tonnes. That makes it more economic in production. So, this way, we are trying to cover up most of the requirements of the intermediates by pooling with the requirements of other industries, but it still leaves certain intermediates which are required in small quantities which it will be very uneconomical for us to produce and will have to continue to be imported. If you see these various intermediates given on pages 36—45, it covers an import of intermediates of the value of about Rs. 7 crores which we need to achieve our Fourth Plan target. Schemes have been undertaken to produce as many of them as possible within the country which will bring down our import bill for the industry to something like Rs. 4-5 crores ultimately which the industry can always earn by developing its exports.

Shri Kashi Ram Gupta: There are a lot of patented medicines whose patents have lapsed, but in spite of this the industry is not able to produce such medicines in this country. Did you consider this point and what are the reasons behind it?

Mr. Chairman: No know-how.

Dr. B. Shah: As I told you earlier if it is a complicated process. We need the know-how. When it is a simple preparation we can develop our own. It is again a question of developing our own technical base so that we may be able to produce all the items within the country either with our own know-how or with imported know-how.

Shri Kashi Ram Gupta: Whether efforts have been made in this direction to produce our own know-how so far as such medicines are concerned whose patents have lapsed?

Dr. B. Shah: Yes, Sir. There have been several efforts. This is the aim of all our various Plans, Third Plan, Fourth Plan, etc. Based on our demands we fix our targets and license the capacities. We request the research laboratories also to develop the know-how for their manufacture and we encourage entrepreneurs to take up these processes and start producing them within the country.

Shri Kashi Ram Gupta: Have you been successful?

Dr. B. Shah: Yes, we have achieved more or less our Third Plan targets to a great extent. We hope the same co-operation will come forward to achieve our Fourth Plan targets.

Dr. C. B. Singh: Dr. Shah just now read some statistics from some paper. We would like to have a copy of that.

Dr. B. Shah: I will send it to you.

Mr. Chairman: Thank you, Mr. Shah, and your colleagues.

(The Witness then withdrew)

II. Dr. M. L. Dhar, Central Drug Research Institute, Lucknow

(The witness was called in and he took his seat).

Mr. Chairman: Those of us who had gone to Lucknow had the benefit of his evidence and that has been circulated to the members. If you want to ask any new questions, you may ask.

Mr. Dhar, the evidence that you give is published and whatever you say will be printed and published and given to our Members and also laid on the Table of the House and even if you want any particular portion to be kept confidential it will be published and given to all the Members and laid on the Table of the House.

We had a discussion with you at Lucknow. The gist of that discussion has been distributed to all the Members. If you want to add anything you may kindly do so and then our Members will put some questions.

Shri Kashi Ram Gupta: I would invite the attention of the witness to one aspect that has been raised again and again, and about which a great controversy is raging—that is the period for the patent. One view is that it should be protected and it should not be more than 3 or 5 years. There is another view that it should be 10 years and another view is that it should be 16 years. I want to know the basis on which the period should be fixed.

If it is on the basis of return on the investment and all these things, it must be backed by some data. On that occasion no such data was given by you. If such data is there which can rather go to prove that such and such period will suffice—in certain special cases it may not be so; in general cases it may be so—please give us that data. This is the most crucial and controversial point. On the one side, there are the scientists who say that the period should be the minimum. On the other side, there are the industry people who say that the period should be more. There is a midway between the two, which is the Government side and which is before us. Please elaborate on this point.

Dr. M. L. Dhar: I said in Lucknow, my personal opinion is that in the interests of the country and scientific and technological advance in particular, abrogation of patents is ideal. I still hold to that view. However, if a stand is to be taken that patent in some form or other has to remain, I suggest that a patent must be given from the date of first filing for a maximum of 10 years, because filing of detailed specifications takes some time, or from the date of sealing 7 years, whichever is lower. The other part of the question is: on what do I base these figures of time? As a laboratory worker, I should like to point out that a research worker in a laboratory, as soon as he has found out that one of his materials has biological activity and has potentiality of being used as a drug, files a patent. He works on this and tries to complete the biological data on this point within a period of one to one-and-a-half years. During the same period, a good laboratory gets going on developing the industrial method of making this compound. Then comes the stage of chronic toxicity tests, that is, you want to find out over a period of time whether it is going to be toxic to the human system or whether it is going to be harmful to the progeny of the person who is taking this drug. So that takes another one year. So it comes to $2\frac{1}{2}$ years. I am talking of a good laboratory which means business. So, $2\frac{1}{2}$ years is, in my opinion, sufficient for this. Then comes the clinical pharmalogical test where the drug is tried on normal human beings, which again is done by the laboratory itself. This test is to find out what will happen if the compound is given to a normal person who is not suffer-

ing from any disease. That takes another six months. So you have in all 3 years. By this time, the laboratory must have developed also the know-how for the production of this compound on a commercial scale. Then you must take one to two years for complete clinical trials. If the clinical trials indicate that there are no harmful effects from this drug, it comes to the market. From this date, five years is a very very considerable time to make whatever money anyone wants to make.

Shri Kashi Ram Gupta: This is the main point on which I put the question. How can it be possible for a concern to take out money in five years when the amount of investment is very huge? Has it been calculated on a commercial basis or only on a pilot project basis?

Dr. M. L. Dhar: I am a research man essentially and my opinion is based upon the data which I have gathered from the industrialists in this country, in the United States and in Europe. It is well-known that any industrialist must make most of what he has in the first three years after the introduction of the drug because they make a very very pronounced effort on advertisement or what they call 'market promotion' of the drug as soon as the clinical trial is over. As a matter of fact, they invest very nearly twice the amount and sometimes more on this aspect of the problem than they do on research. Therefore, it is my belief that a period of five years is thoroughly sufficient for a drug. Further it is now accepted by people in this field of drug research that the average life of a modern drug is 5 to 7 years and at the outside, ten years. So if the life of a drug is that limited, the drug industry must make the money in the shortest possible time.

Shri Kashi Ram Gupta: The industry has given us a different picture altogether. They try to show that 5 years is not at all sufficient for them to make up the money. So, is that a wrong statement of fact according to the information that you have given us, or that has got some other aspect which remains unexplained?

Dr. M. L. Dhar: I am not competent to comment upon the data provided to you by the industry. I am only saying that I am a scientific worker and I have been in the research field for over a quarter of a century and I think that I am supposed to know a little about what happens in this field. Of course, one can get together statistics on points which are favourable to the view one holds. But I want to emphasise the basic point that the industries invest very much more money on the selling aspect of the various drugs. Here in India, we don't spend very much money on this, but in the U.S. and other countries, they spend 8 to 10 per cent on research and 25 per cent on propaganda. Now one can make all the money in one year if the drug is good. But if the drug is not good, one may not make any money. We had discovered an anti-thyroid drug at the CDRI, but fortunately there are not many people suffering from this disease and we cannot cover the expenses in too short a time. But there are life-saving drugs like tetracyclines and penicillin, where money gets made much faster than most people imagine.

Shri Kashi Ram Gupta: Is it possible for you to give statistical data on an average scale?

Mr. Chairman: How can he.....

Shri Kashi Ram Gupta: My point is whether statistical data of this sort can be prepared to show that 5 years would be enough.

Mr. Chairman: He is not a statistician. I don't think he has got statistics.

Dr. M. L. Dhar: I would like to answer that point. As I said a little

while ago, I would not like to comment on data given by an agency which is doing business. I am a laboratory worker and my contacts are fairly wide in the industry. There are drugs and drugs. There are life-saving drugs which save millions of people, and on which money gets made. There are other drugs, prestige drugs, on which money never gets made, but they are put on the market. I am sorry it will not be possible for me to give statistical data on this point.

Shri V. B. Gandhi: Is it your experience that in most advanced countries the period or the term of licence is as short as you propose. Our impression is that the term of a patent is much longer than you have proposed in most of the advanced countries.

Dr. M. L. Dhar: My principal belief is abrogation of patents. That is my ideal.

Shri B. K. Das: Only one point I want to know. We have got in evidence from other scientists also, they think that after invention of some drugs, it takes several years for clinical and other tests, but you are saying that it does not take more than three years or so to put in into the market as a medicine..

Dr. M. L. Dhar: I said 4 or 5 years from the date of filing the first patent. That is an sufficient length of time for a laboratory to get going.

Shri B. K. Das: There may be certain drugs which may take a longer period.

Dr. M. L. Dhar: I do not think so, Sir.

Shri B. K. Das: The other day we asked something about investigation on indigenous medcines and plants and certain information was given to us about that. And here also in your note, we have some figures on the work that has been done in this field. But I am not sure whether out of these so many plants that you have experimented upon, only a few have been found to be effective. What is the reason?

Dr. M. L. Dhar: I think the reason is obvious. I think I explained the reason why one does not get as much success in indigenous medicines as one ought to. My personal opinion is that if ultimately we get one drug out of these 489 (the figure that you have before you), the Drugs Research Institute will be exceedingly lucky. Even these figures are high. They are at the primary and secondary stages. Many we drop at the secondary stage and even later.

Shri B. K. Das: Is it your opinion that out of these plants that you have experimented upon in your laboratory, only on these few you want to have follow up studies and others you discard. In that case, where is the chance of success?

Dr. M. L. Dhar: My data is based upon laboratory findings.

Shri R. P. Sinha: I would like to know from the learned witness as to what is the annual budget of his laboratory.

Dr. M. L. Dhar: I have said our annual recurring budget is today 28 lakhs and an odd thousand rupees.

Shri R. P. Sinha: I would also like to know how many patents have been taken by this institute.

Mr. Chairman: That also he has given.

Shri R. P. Sinha: Probably if he says it will get recorded.

Dr. M. L. Dhar: I thought it was on the record. I have provided all the information in the note that you have before you.

Shri R. P. Sinha: May I know what time it takes for a basic new drug to pass. Once it is established as a new

drug which is good for clinical purpose what time it takes for him to get it passed by the Drug Controller, so that he can use it on human beings.

Dr. M. L. Dhar: I did not have any difficulty with the Drug Controller.

Shri R. P. Sinha: I am not saying that. I want the time taken.

Dr. M. L. Dhar: I get my replies within 15 days.

Shri R. P. Sinha: I am not talking about replies to letters. What I am saying is this. What I understand as a layman, the Drug Controller has prescribed certain clinical tests, certain procedure that must be undergone, certain tests must be done before the Drug Controller sanctions a new drug to be used on human beings on a large scale. Now what is the time taken for completition of that?

Dr. M. L. Dhar: I thought I had answered that question earlier. It is at the outside 5 years, in a good laboratory. For the colletcion of this data, it takes upto a maximum of 5 years in a good laboratory. I would like to underline the words "good laboratory".

Shri R. P. Sinha: How many such good laboratories have you got in India?

Dr. M. L. Dhar: This is a very interesting question, Sir. I wish there were a hundred. We have one drug research, laboratory which is sponsored and provided for by the Government of India with a budget of 28 lakhs of rupees. We have one more laboratory sponsored by Ciba at Bombay who have a nice staff, about one-third our staff and about twice our budget. Effort is being made also by a few firms in Calcutta like the Bengal Chemicals, and at Baroda and so on. The total amount of money that this country spends on drug research, in my opinion, is of the order of 1 crore. As a sequence to this question—because I think my answer will assume a meaning—I should like to explain, Sir, what expenditure is invested in other countries of the world on drug research. As I told you when you came to Lucknow, according to the information that I have, the United States of America's drug industry spent 360 million dollars on drug research last year, and the Government of the United States, through their National Institute of Health, have spent I billion dollars. Now this 1 billion dollars was not all spent on drug research as is understood commonly. It was spent on the understanding of the disease conditions as also on the finding of new drugs, so that the total research effort of the United State of America in 1965 was 1 billion 360 million dollars. Our total research effort, I said a little while ago, is of the order of 1 crore of rupees, or 10 million rupees, and our other research effort corresponding to that of the National Institutes of Health U.S.A. is of the order of about 1.5 crores or 15 million. So it comes to a total of 25 million rupees. If you want to stretch it as far as you wish to and put everything in, it comes to something like 3 crores of rupees, as against 1 billion 360 million dollars.

Shri R. P. Sinha: The witness has given very interesting figures. I will come to these figures later. At present I will take the thread of my original question. The witness has said that it takes for a good laboratory 5 years time to complete the clinical tests before the Drug Controller can certify a drug for commercial marketing.

Dr. M. L. Dhar: I said from the date a scientist discovers an activity in a particular material and upto the stage of clinical trials in a good laboratory it will not take more than 5 years. It may take less.

Shri R. P. Sinha: You have said because of our research expenditure being low there are not many such laboratories. Now, I would like to

know for an ordinary laboratory where the facilities are not adequately provided how many extra more years, *i.e.*, more than 5 years, will be taken?

Dr. M. L. Dhar: I said a good laboratory. What time an indifferent laboratory will take, to that my answer is....

Shri R. P. Sinha: An average laboratory and not an indifferent laboratory.

Dr. M. L. Dhar: An average laboratory in various universities in India may never find it.

Shri R. P. Sinha: What would the correct average, say in India, for getting a clinical test?

Dr. M. L. Dhar: Not more than five years.

Shri R. P. Sinha: Mr. Chairman, he says five years period is taken up with regard to getting to the clinical test. Now, my second question is: how many years it will take for a laboratory stage pilot plant to pass into a commercial stage? Has that point been studied by the learned witness? Can he tell us in Indian conditions of technology what time it will take for developing a laboratory stage plant to commercial stage. Here we are not discussing any proposition in a theoratical way. We are here called upon to apply our mind to give a practical hape to this Bill which will be a workable proposition for the development of industry in this country. We are not concerned with theories. Therefore, I would like to know from the practical experience of the learned witness, of his own experience, that in the Indian conditions how many years it will take to get the commercial stage production after the laboratory tests are over?

Dr. M. L. Dhar: This will require an extended answer. The answer is two-fold. Firstly, are we dealing with a drug which has been discovered today or are we dealing with a drug which has been announced and has been patented & produced by somebody. If we are dealing with a drug which has been discovered *de novo* under our conditions as they are today—I may point out in this connection that the conditions of technological development, availability of raw materials, availability of equipment which we need for working up these raw-materials we had nothing at all in this direction a few years ago. We are still getting most of the equipment from abroad. We still import a large number of intermediate chemicals. But in the recent past and now, very serious efforts are afoot by Government agencies and by private sector to get fine chemicals and intermediates and the equipment made in this country. Sir,—in the meantime naturally the technologists get trained. I will give an example. At the Central Drug Rerearch Institute we started a process development unit roundabout four years ago. It took 1½ years to get it equipped. We started functioning about 24 to 30 months later. In this period we have worked on 15 different processes, synthetic processes, of producing drugs. I am talking about known drugs. We have developed the technical know-how about these. We have demonstrated the technical-know-how of a number of these to the industries. Two products are under-production by the industry in the country now.

Mr. Chairman: His simple question is: what time does it take from clinical stage to commercial stage?

Dr. M. L. Dhar: Sir, the words used are 'Indian conditions' and it wants an extended reply. Under the Indian conditions, if I know what I have to make, I should be able to bring it to commercial stage in about a year's time.

Shri R. P. Sinha: Will it be correct to say that on an average it will take one year to develop from pilot stage to commercial stage?

Dr. M. L. Dhar: I have said normally it will take, for a simple known drug, one year whereas it may take more than one year in others. On an average I said one year.

Shri R. P. Sinha: Is the witness aware that at Pimpri for haymycin it is now more than three years when they completed their pilot production and they have not yet gone into commercial production because of the technological development available in India and so many other difficulties are there.

Mr. Chairman: We have already gone to Pimpri and the information is available with us.

Shri R. P. Sinha: I want the answer from the witness.

Dr. M. L. Dhar: If you like, I would perhaps say something about haymycin because I happen to be concerned with Hindustan Antibiotics. I have earlier said we are making efforts to make equipment in this country. If we have to import equipment it must take time. I know the difficulties involved. Some of the equipment had to be imported.

Shri R. P. Sinha: What I understand from the witness is this: it takes some time in Indian conditions because we are technologically backward, we have got to develop our own process, we have got to import technology and equipment, therefore it takes some time to develop from the initial stage to the commercial stage. Now, supposing 6 year's time is required for clinical test, if I would say one to three years may be required for developing commercial stage production, that means that seven to nine years will be taken up before the commercial production starts. The witness has stated that seven years' period should be enough for grant of patent . . . .

Shri Kashi Ram Gupta: From the date of sealing.

Shri R. P. Sinha: Now, if 7 to 9 years, according to the witness, will be taken up for the purpose of coming into commerical production then the patent will have expired before it goes into commercal production. The witness has given very informative information with regard to research work that is being done in India. He has stated the amount of money spent in India and the amount of money that is spent in America. What is necessary according to the witness is that more and more money should be spent both on the research in the private sector and in the public sector. For the public sector Parliament can provide money to the Drug Research Institute without asking whether we are getting adequate return or not. So far as the private sector research is concerned as in America and other places, there should be adequate investment in it in time to come. We are going to have a patent law of seven years period and if we take about seven to nine years, according to the witness, to go into commercial production, how do we expect that the research in the private secter will develop either with the assistance of the Indian investment or by inviting foreign capital for research work? These are contradictions. I shall be greatful if the witness can throw some light on this subject.

Dr. M. L. Dhar: In my first statement that I made I said that the people in the laboratory do two things. They do biological tests of the compound. They also go on simultaneously developing a process for the production of the drug. So, by the time the drug is clinically tried the method for its commercial production is ready. Therefore, the figure of 7 to 9 years is not correct. I will say five years. I think I have answered the question, Sir.

Shri Kashi Ram Gupta: Question is this. CIBA spends, with one-third scientists, double the amount which our Institute spends. Is there some

reason behind it? What is the correct position?

Mr. Chairman: He does not say it is sufficient. He says more must be spent.

Shri Kashi Ram Gupta: No, Sir; I want to know the reason behind it. The point is that CIBA's expenses are unusually high.

Dr. M. L. Dhar: I would like to answer this question, Sir. It is common knowledge all over the world—I am not talking about the USSR, I am talking about Europe, USA and also our country—that industry always pays a lot more to their scientists, provides much better facilities than what the Government provides. Yet, it does not mean that spending a lot more money for lesser effort is wise.

Shri K. K. Warior: In the ancient Ayurvedic system, in our place in Kerala, we are told that there are about one thousand combinations. Then it is called 'Shastra yoga.' I wish to know whether the Lucknow Laboratory is passing it only as a single substance or in combination with herbs, etc.?

Dr. M. L. Dhar: The correct assessment of the combination can be done in a hospital. If the hospital establishes the usefulness of a a combination then the laboratory can work on the components of these combinations. I have been trying to say this before the Indian Council of Medical Research and Health Minister that clinical trials and introduction of modern medicines must go on simultaneously.

Shri K. K. Wariar: Now I wish to know whether the activity of a single substance will be the same or different?

Mr. Chairman: It has to be different. It cannot be the same.

Shri K. K. Warior: Thirdly, how our old knowledge is integrated into the new system I speak from political knowledge and not from scientific knowledge. What is the activity of the Lucknow Laboratory to enrich itself and enrich our knowledge already there? It has stagnated for some time. It is my information. Otherwise, I don't mind exploiting our drugs by somebody else—which they are doing.

Dr. M. L. Dhar: I would only say, as the learned Member here has himself said, that there is stagnation in this. The whole system has remained stagnant for about 2000 years. Knowledge has advanced. I, as a scientific worker, would like to look at it in an analytical manner. I would like to be assured that the knowledge that was available about 2000 years ago has not been passed on to us in an adulterated form. If this could be resolved it would be a wonder, and this is the effort which we have to make.

Shri K. K. Warior: Is there any mutual understanding to integrate the modern scientific technological knowledge with the old wisdom so that we will have an indigenous content in the system with modern standardised pharmacology.

Mr. Chairman: That is what they are trying to do.

Dr. M. L. Dhar: We are doing our best to find out objectively by means of modern scientific methods what we can get out of the ancient drugs.

Shri K. K. Warior: How long will you take to have a complete indigenous pharmacopoea in which all our Indian drugs would be included?

Dr. C. B. Singh: All of them!

Mr. Chairman: Out of about 4000 drugs how many CDRI has taken up?

Dr. M. L. Dhar: About 400 of them.

Shri K. K. Warior: In how many we have succeeded so far?

Mr. Chairman: It takes time.

Shri Warior: I don't say that all of them should be taken up at a time. I only want to know whether they are inclined to take up these ancient drugs also or whether they will be guided purely by the modern technology.

Dr. M. L. Dhar: The CDRI was set up to find out new drugs; whether they came from the ancient system or from the modern system was not emphasised. Naturally, we as a laboratory are anxious to discover new drugs from whatever system it may come. We are doing our utmost in that direction.

Shri K. K. Warior: How many patents this Institute has taken now? How many of them are successful?

Dr. M. L. Dhar: I think I have given all the information in my note. We have reluctantly taken 36 patents.

Shri K. K. Warior: Is there any possibility of foreigners stealing our processes?

Dr. M. L. Dhar: I don't think I can answer this question.

Shri K. K. Warior: Have you taken patents for your drugs in foreign countries?

Dr. M. L. Dhar: Two or three.

Shri K. K. Warior: Has it given foreign exchange earnings?

Dr. M. L. Dhar: We are not expecting at present.

Shri Prabhu Dayal Himatsingka: You know the difference between the patented drug and the developed drug as sealed for use. You think that your drugs will be accepted by the Doctors very quickly immediately after the drug is perfected, which will enable you to realise your investments?

Dr. M. L. Dhar: In a democracy, it will depend upon how much sales promotion the manufacturer is able to do and also on his persuasion of the Doctors. In a more rigid system of Government, if it is prescribed that the Doctors will use Drug A then the Doctors will have to use the Drug A.

Shri Prabhu Dayal Himatsingka: Will it be possible to sell these drugs quickly for the ordinary people who are not big manufacturers?

Dr. M L. Dhar: I don't think that the drug industry can be run by an individual or as a cottage industry.

Dr. C. B. Singh: There was a proposal to have a hospital for drug trials.

Dr. M. L. Dhar: There was a proposal to have a hospital. But my personal belief is that a research laboratory finding out a drug must not have a hospital attached to itself because the clinical tests must be completely objective and independent of the influence of the laboratory.

Dr. C. B. Singh: Where are these clinical tests done now?

Dr. M. L. Dhar: King George's Medical College, Seth G. M. Medical College and also in the Indian Council of Medical Research.

Dr. C. B. Singh: As the proposal was to send them to Kanpur or Lucknow. I asked this question for my information.

Dr. M. L. Dhar: The Lucknow Medical College has tried one of our drugs on over a 100 patients by now.

Mr. Chairman: We thank you, Dr. Dhar.

(The witness then withdraw).

(The Committee then adjourned)

Minutes of Evidence given before the Joint Committee on the Patents Bill, 1965

Saturday, the 27th August, 1966 *at* 10.05 *hours.*

PRESENT

Shri S. V. Krishnamoorthy Rao—*Chairman*

MEMBERS

Lok Sabha

2. Shri Bibhuti Mishra

SECRETARIAT

Shri M. C. Chawla—*Deputy Secretary.*

WITNESSES EXAMINED

I. (1) Shri S. K. Borkar, *Drug Controller, Government of India, New Delhi.*

(2) Shri P. S. Ramachandran, *Deputy Drug Controller, Government of India, New Delhi.*

II. (1) Dr. A. Joga Rao, *Controller General of Patents and Designs, Government of India, Bombay.*

(2) Shri R. V. Pai, *Joint Controller of Patents and Designs, Calcutta.*

1.(1) Shri S. K. Borker, *Drug Controller, Government of India, New Delhi.*

(2) Shri P. S. Ramachandran, *Deputy Drug Controller, Government of India*

(The witnesses were called in and they took their seats)

Mr. Chairman: I must repeat the formula. You know the evidence that you give is public. It will be printed and circulated to the Members of Parliament and placed on the table of the House. Even if you feel that any part of the evidence to be confidential, it will be printed and circulated. Have you got to say anything on the Patent's Bill? You may please give us your opinion.

Shri S. K. Borkar: Sir, the period of the validity of a patent as proposed in the Bill is ten years. I would submit that ten years is more than adequate to meet the needs of the situation, and if it is possible it may be lowered to seven years, because 7 years period is more than adequate to compensate for the research costs that the manufacturer incurs and will also give him sufficient returns for the expenditure that he makes on drug research.

The provision for licence of rights is absolutely a must because merely having compulsory licensing which provision exists in the present Act is not enough for the development of this industry in this country. If it is possible by some ways to provide for getting the technical know-how from the patentee that would be a desirable addition to the present provisions.

These are the general remarks I have to offer in regard to the provisions of the present Bill and if there are any questions, I would be glad to answer.

Mr. Chairman: You said that the period of patent should be 7 years. The present Bill provides 10 years from the date of specification.

Shri S. K. Borkar: From the date of final specification.

Mr. Chairman: Suppose we make it 7 years from the date of sealing?

Shri S. K. Borkar: It depends upon the time taken between the date of filing the specification and the date of sealing. If it is about a year or so, one would not mind, but if it takes an inordinately long time, the actual period to which the patent would be applicable should be 10 years from the date of filing.

Mr. Chairman: 10 years from the date of specification?

Shri S. K. Borkar: From the date of filing the complete specification.

Mr. Chairman: What is the time given for filing the complete specification after the application?

Shri S. K. Borkar: It is 18 months.

Shri K. V. Venkatachalam: It is about a year. One year is given for filing the complete specification.

Mr. Chairman: The present Bill provides 10 years from the date of specification. Suppose we make it 7 years from the date of sealing?

Shri S. K. Borkar: After filing the complete specification till the date of sealing—that period we will have to take into account.

Mr. Chairman: What is that period?

Shri S. K. Borkar: That could be reduced to one year—that is from the date of filing the complete specification till the date of sealing. In that case, 7 years after the date of sealing is acceptable.

What shall have to be done could be done better perhaps by administrative action. Under the Industries (Development and Regulations) Act there are certain provisions which the applicant for patents has to comply with and perhaps these provisions could be made use of for getting the knowhow. Merely providing in law perhaps may not meet the situation because we cannot force the party to give the know-how. Then again we are not quite sure whether the know-how that is available is the best know-how. This is a matter which will have to be examined by a very high technical Committee. Even at the moment we are not quite sure whether the technology that is available here is the best technology. After all the criterion for a good technology and the index of that would be the ultimate price at which the product is made available. The better the technology the lower should be the cost. But our experience here has been quite the opposite.

Mr. Chairman: Can administrative measures get us the technical know-how? Is it possible? It may be done by administrative measures—you said.

Shri S. K. Borkar: Both administratively and there should also be some provision in this Act.

Mr. Chairman: That is what I say. What do you propose as Drug Controller? Suppose you want to provide some provision whereby the technical know-how is made available.

Shri S. K. Borkar: At present the maximum rate of royalty has been fixed at 4 per cent. That is only to enable one to work a patent. If there was an additional incentive given—say if the best know-how is also made available, the rate of royalty could be slightly increased or some *ad hoc* money sanctioned—that would be a sort of incentive.

Mr. Chairman: What will be the proper percentage you would suggest?

Shri S. K. Borkar: If the know-how is made available, another 4 per cent. To-day I find a lot of money is spent by way of giving know-how to us.

Mr. Chairman: Have you got any idea of what they pay now for the know-how?

Shri S. K. Borkar: Those figures I do not know. Royalty is a sort of perpetual payment. If some *ad hoc* money could be sanctioned, we could save a lot.

Shri V. B. Gandhi: Is not the royalty a kind of consideration for giving the know-how?

Shri S. K. Borkar: I will come to you.

Mr. Chairman: Can we provide by law here for the additional percentage for know-how? Or should it be a matter for negotiation?

Shri S. K. Borkar: It would be a matter for negotiation. I cannot suggest what provision can be made in the law.

Mr. Chairman: Can you suggest how it could be brought into the Bill itself?

Shri S. K. Borker: I will think over it.

Mr. Chairman: You consider the licence of right is a must. If the Government is to have that power, is it not necessary to pay some compensation to the man?

Shri S. K. Borkar: That does not preclude the paying of royalty. There is a provision in the Bill—clause 88(5).

Mr. Chairman: Where the Government want to import, do you think that the Government can import or get those medicines without even payment of the royalty?

Shri S. K. Borkar: You refer to Section 48, the right of Government to import. It would be quite fair if a provision is made for paying compensation.

Mr. Chairman: Yes, there should be some compensation; otherwise, it means expropriation.

Shri S. K. Borkar: Rate of compensation may be the same as provided in the case of royalty. About a—maximum of 4 per cent subject to tax.

Mr. Chairman: Suppose a patent is taken and then what steps are carried out? What is the time taken by your office to give a licence to the manufacturer?

Shri S. K. Borkar: In the case of an entirely new drug it takes on an average about 2 years.

Mr. Chairman: When it takes so much time, can you not reduce that period?

Shri S. K. Borkar: That depends upon the facilities available in the country for carrying out clinical trials and the nature of the drug. At the moment we do not have enough facilities. Suppose a new drug is developed at a stage where it has passed the toxicity and other pharmocological trials. When it comes to trial on human beings it has to go to the hospitals and the trials should be carried out under expert supervision. We try to see where the specialists are available and where the facilities exist. At present these are not enough. The result is if one individual specialist is busy trying one drug it takes him quite some time before he undertakes to try another drug. Unless these facilities are expanded, the time cannot be shortened. There have been some drugs which have taken as much as 36 months whereas there are others where it has taken about 8-9 months depending upon the nature of the drug.

Mr. Chairman: Also the side effects have to be taken into account.

Shri S. K. Borkar: Naturally clinical trials and toxicity tests are for that. We are trying to expand the facilities. In the case of drugs which are liable to be used on a long-term basis for chronic cases, as for instance the drugs for diabetes or drugs which patients have to live with such as anti-hypertension drugs, it is necessary to be very very cautious and you should also see the long term effects of using them.

Mr. Chairman: Does it take the same time in other countries?

Shri S. K. Borkar: In the United States, of late, since the Thalidomide incident, they are more cautious than what they used to be. There again they have got greater facilities. They spend a lot of money on medical research. We cannot strictly compare the facilities available there with the facilities that we have here. I should

say that for complete investigation, a period of about 2 years would not be too much. After all we must be sure that the drug is safe. Then it must be efficacious.

Mr. Chairman: We have heard that it takes about 5-7 years to bring it into use. How can we reduce the period to the minimum?

Shri S. K. Borkar: There are certain trials which cannot be accelerated, particularly if you want to see the long term effect of the drug.

Dr. C. B. Singh: Evidence has come before the Committee that it takes about 7 years.

Mr. Chairman: First the discovery is made and then tried on animals and then tried on human-beings. Evidence has been given before the Committee that it takes about 7 to 10 years before it reaches the production stage and the marketing stage. So there is hardly any time to recoup the research costs and also to make some profit. Your argument is that this period cannot be reduced.

Shri S. K. Borkar: I was making the point about the clinical trials only.

Shri R. P. Sinha: What are these clinical trials and who does them?

Shri P. S. Naskar: The Chairman has put three points specifically and you may answer those three points.

Shri S. K. Borkar: I stated only the time taken for clinical trials on human-beings. I was not referring to the earlier period.

Mr. Chairman: The point is that it takes about 4 to 5 years to discover the drug and then including the trials on animals and on human-beings it takes about 7 years to reach the production and the marketing stage.

Shri S. K. Borkar: It all depends upon the facilities that the manufacturers have. In most cases, the various operations are collatual.

Dr. C. B. Singh: The CDRI has got the best facilities—will you agree with this?

Shri S. K. Borkar: I agree with that.

Mr. Chairman: It takes about 3 to 4 years earlier also; that is what the evidence before the committee says.

Shri S. K. Borkar: Maybe in the case of some drugs the time taken is that much.

Shri R. P. Sinha: There is a point of order which I would like to submit for your ruling. This is a parliamentary committee and we enjoy all the privileges of Parliament. I would like to say that the Ministers and the officers must be careful before they answer our questions and should also be conscious of this fact that on factual matters they do not mislead the committee. The Ministers and the officers may mislead the Cabinet and we don't know what happens there. But misleading the parliamentary committee involves a breach of privilege.

Mr. Chairman: I agree with you, but there is no point of order.

Shri Bibhuti Mishra: You just now mentioned that the period of validity of patents after sealing should be 7 years. What did you suggest to the Government about this period?

Shri S. K. Borkar: Our original proposal was 7 years. We tried to put our own views....

Shri P. S. Naskar: To the Health Ministry.

Shri S. K. Borkar: Yes. 7 years from the date of final specification. 7 years has been made into 10 years perhaps to accommodate the various views as represented to Government.

Shri Bibhuti Mishra: How much time will it take for the department to finally seal the patent from the date of application?

Shri S. K. Borkar: The Member probably wants to know how long it will take for anyone to put into the market a drug from the date it has been patented.

Shri Bibhuti Mishra: How much time your department will take to finally seal the patent from the date of its application?

Shri S. K. Borkar: My department is not concerned with the granting of patents.

Mr. Chairman: Mr. Mishra, he is the Drugs Controller.

Shri Bibhuti Mishra: But he is an expert and he may give his views about this.

Mr. Chairman: The Patents Controller is coming to give his evidence and you can ask him this question.

Shri Bibhuti Mishra: What is your view about India becoming self-sufficient in drugs and medicines and how long will it take?

Shri S. K. Borkar: First we have to build up our basic organic chemical industry and till such time as we don't have the basic organic chemical industry we cannot hope to become self-sufficient. Attempts are now being made to start Hindustan Organics; maybe next year it might go into production. It is only then we can think of self-sufficiency.

Shri Bibhuti Mishra: Can you give us any idea as to how much of medicines and intermediates we get from abroad?

Shri S. K. Borkar: About the patented medicines, as it is commonly understood, there is a slight difference from what we mean by patents in this Bill. The common conception of a patent medicine is any tonic. But anything that you take as a patented medicine is commonly deemed to be a patent. That is not the meaning conveyed by patents in this Bill. The total import bill in respect of drugs including the chemicals and intermediates comes to about Rs. 13 crores.

Mr. Chairman: Can you give the break-up?

Shri S. K. Borkar: I will certainly send the information. Intermediates worth about 2½ to 3 crores are imported. We don't allow the finished drugs to be imported. We get the things in a basic form; basic drugs are imported and then formulated.

Shri Bibhuti Mishra: In India certain factories have been set up on collaboration basis. As the Drug Controller, are you in favour of collaboration?

Shri S. K. Borkar: In the absence of our own industry and in order to maintain the health of the people, collaboration is a second line of approach. The first line of preference would certainly be to have our own industry whether it is in the pubiic sector or in the private sector. Collaboration will come next. We must have our own industry. But if that is not possible, then we can go into collaboration.

Shri Bibhuti Mishra: You said that we import Rs. 13 crores worth of drugs and out of that Rs. 2½ crores worth are intermediates. Can we get alternative supplies? For example, if we don't get sugar, we can use gur.

Shri S. K. Borkar: Whether it is sugar or gur, what is needed is sugarcane. Now when I mentioned the Hindustan Organic Chemicals, I was referring to the basic industry. It is only then we can think of a lower chemical or a higher chemical. At the moment, we don't have any basic industry.

श्री विभूती मिश्र : पटेंट दवाइयां क्या आप समझते हैं कि १०० परसेंट सही होती हैं।

Shri S. K. Borkar: The quality of the drug has no relation to patents. The quality is governed by the Drugs Act. Whether a drug is patented or not, the standards are controlled under a separate legislation.

Shri Bibhuti Mishra: In Ayurvedic medicines there is no patent. But it has also got some formula. Any doctor can produce the medicine from that formula, like Chavanprash. If the doctor makes it well, then it works. So patent is harmful to India.

Shri S. K. Borkar: Patents relate only to the basic drugs and not to the formulations.

Shri Sham Lal Saraf: To what extent have our laboratories shown all-round progress in ensuring creative capacity so that they are able to manufacture these basic drugs?

Shri S. K. Borkar: So far as the development of new drugs is concerned, our contribution has not been very sizeable. But so far as formulations are concerned, our industry has done very well and it can compare with any in the world. About basic drugs, there are a few factories where we have started making them from intermediates and even lower chemicals. In this connection, I would refer to the attempts made in the Calcutta and Baroda regions. There are two or three firms there who have been poineers in this effort and I might make myself bold to mention their names—the Bengal Immunity, the East India Pharmaceuticals, Bengal Chemicals and Alembics. Benticals and Alembics have done their best to make their drugs from the basic stages without any foreign know-how and without any foreign collaboration. They have done much better in the manufacture of basic drugs than some of the Western India counterparts.

Shri Sham Lal Saraf: Out of the total drugs that are being prescribed, only 2 per cent are patented drugs and out of this, 98 per cent is imported. Now keeping that in view, may I know how our Drug Controller proposes to remain in touch with the creative capacity vis-a-vis the life-saving drugs being achieved or maintained in the foreign countries, particularly in the advanced countries? How does he propose to do it when he suggests that against the accepted period of registration of these patentable drugs in the rest of the world, particularly the advanced countries, and a period of 10 years initially as recommended in this Bill, he still wants 7 years?

Shri S. K. Borkar: In regard to the first question, namely, that out of the drugs that are consumed in this country, only 2 per cent constitute the patented drugs, Sir, I beg to differ ...

Shri Sham Lal Saraf: It is not my statement; this is what we have been given.

Shri S. K. Borkar: I really do not know the source. Here I have got only a cross-section of the drugs which are currently marketed in this country and out of a total turnover of Rs. 150 crores in drugs, the patented items constitute about Rs. 60 crores worth. It may be, Sir, that the drug ingredient in a tablet or in an injection forms a small proportion of the total cost or the price of the formulated product. For example, I will take the case of a drug which is used against inflammations. Now if you go into the cost of the drug itself, it may be about 8 paise in a five milligram tablet—I am only giving you a rough idea; if I am allowed to calculate, I will be able to give a correct figure, but now I am only giving a case in point. When it is sold, I will have to pay something like 80 paise. If you take 80 paise as the turnover, the ingredient is only 10 per cent. From that point of view even, I guess that the statement that only 2 per

cent of the patented drugs are in use in the country is far below the factual position.

Mr. Chairman: What is the percentage according to you?

Shri S. K. Borkar: About 60 per cent of the drugs currently marketed consists of patented drugs. That is to say that in these formulations there is an ingredient which is patented. Now we say that our drug industry has made phenomenal progress. Certainly from Rs. 10 crores in 1948 to Rs. 150 crores today is really phenomenal progress. But if you analyse the figures to see how this amount of Rs. 150 crores is made up, I would say that at least 50 per cent of Rs. 150 crores consists of drugs which are sold over the counter. Tonics and vitamins and medicines like anacin and aspro constitute by and large a large share of this Rs. 150 crores. So, if we exclude this, the remaining portion of the drugs—say about Rs. 80 or Rs. 90 crores—is actually prescribed by the physicians. Out of this amount of Rs. 90 crores, I would certainly say that at least Rs. 60 crores are those which are patented, or which contain an ingredient in them which is patented.

Shri Sham Lal Saraf: Another thing. It is corollary to this question. Is it 60 per cent from the point of view of ingredients as far as the drug is concerned or from the point of view of the total cost factor?

Shri S. K. Borkar: It is from the turn-over.

Shri Sham Lal Saraf: You mean the sale price, not the cost.

Shri S. K. Borkar: Yes.

Shri Sham Lal Saraf: I was under the impression that it is too less a proportion. Because of the explanation that he has given, it seems the proportion is much more. All the same it becomes very necessary for us to know one thing. Most of the foreign know-how is imported into this country, particularly with regard to these basic drugs and advanced drugs and all these life-saving drugs. When compared to the rest of the advanced countries of the world, he suggests that the patentable period under these registered patents should be brought down to 7 years. May I know whether it will be compatible with all that is prevalent in other such countries, whether they could be prepared, or such persons who are in the possession of this know-how in those countries will be prepared to come to this country or allow this country to import the know-how.

Shri S. K. Borkar: Foreigners may be reluctant to come under these conditions. But that itself might promote our own industries. That might be conducive to ourselves becoming self-reliant. If anything comes in the way today in our becoming self-reliant, it is the Patent Law.

Mr. Chairman: They say, necessity is the mother of invention.

Shri Sham Lal Saraf: A little earlier, the Drug Controller said that we are pretty backward in creative capacity with regard to the basic drugs and at the same time he says if we almost ban indirectly or discourage import of foreign know-how or inventive inventions, it will help us, because, as you said Sir, necessity is the mother of invention. We agree. But how will he balance the two. Whether in his view the first position will be correct or the second. If the first position is correct, he will have to explain how it will be possible for this country to remain in touch with the modern progress in the advanced countries of the world if we directly or indirectly ban import of know-how into this country.

Shri S. K. Borkar: In any case, we shall have to be in touch with the developments in other countries. Now to be in touch, to be acquainted with

the developments in other countries, whether it is necessary for the foreigners to come here or can we not do it ourselves is the question. The literature is there, the patents are published and it is for us how to organise our own services, our own departments and to get the know-how.

Shri Sham Lal Saraf: Another question. It may not have a direct bearing on this subject. Will you please apprise us as to the prevalence or the presence of spurious drugs in the market? Whether you have got anything to do with that, whether you have in any way been able to lay your hands on the spurious drugs that are being manufactured. You may be knowing that spurious drugs that appear in the market today are almost the drugs that have been patented. To that extent also, spuriousness has come into the market. May I know what he has got to say with regard to that.

Shri S. K. Borkar: A reply to this question will involve entering into the provisions of the Drugs Act, but without trying to enter into that I might say that first of all the common conception of a spurious drug is that any drug which is not standard is spurious.

Mr. Chairman: Sub-standard drug.

Shri S. K. Borkar: Yes, sub-standard drug. There must be a clear distinction between spurious and the sub-standard drug. Every drug manufacturer in this country must be licensed, otherwise he cannot make drugs. The Government of India had appointed a Committee under Mr. Naskar—the Drugs and Equipment Standards Committee. They went thoroughly into this question and they did come across spurious drugs in the market *i.e.* drugs which were quite different from what they were represented to be, and they came to the conclusion that the incidence of spurious drugs is not so large as it was originally supposed to be. Then again, spurious drugs were manufactured by unlicensed manufacturers whose whereabouts were not known and who were not licensed of course. But amongst the licensed manufacturers, there are a large number of drugs which do not conform to standards. It is all uniform whether it is a big manufacturer or a small manufacturer. Even we have got reports on samples manufactured by very good manufacturers which were not found to be of standard quality. It is mostly in respect of vitamin preparations which are liable to deteriorate, whose standards go down. But in regard to spurious drugs we are concerned with it and we are taking whatever steps we have to take to see that spurious drugs are not coming into the market.

Dr. C. B. Singh: I wonder if you have seen the Supplementary Memorandum on the Patent Bill of OPPI. If you see Appendix No. 5—it is a very important Memorandum and I want you to look into it carefully—they have given statistical figures of the various drugs and the time it took to bring them into the market from the date of filing of the application, from the date of the patent right being given, in the two countries—India and the U.S.A. If you look to the figures given for India, you will be surprised that except one drug, majority of them have taken more time—you can see from top to bottom, I have drawn a line there. In view of the statistical figures that are given there, would you like to change your mind that it takes round about 5 to 6 years to introduce a drug into this country.

Shri S. K. Borkar: Now I will read only the first item—Chlortertracycline. Under that in India patent was granted in 1950, but the product was introduced in 1959—*i.e.* space of 9 years. Now to what this is attributable is the question.

Dr. C. B. Singh: That is not the point. Kindly see the figures. The figure is given all along about the

period taken in India from the date of the filing of the application, figure is also given from the date of grant of patents right and then the date of introduction. Kindly see that and let me know what time you think it takes to produce the drug in this country.

Shri S. K. Borkar: With due respect, unless you know what is it that prevented them from intorducing the product earlier ,it is difficult to say. There might be various reasons which may be coverd by the provisions of the Drugs Act or Industries (Development and Regulation) Act. They may not be wanting to introduce the product because they may not be wanting to manufacture it here if they could import it. These are some of the considerations which weight with them before introducing the product in the country.

Dr. C. B. Singh: Explanations are also given. I wanted your opinion. In view of these statistics will you still stick to the figures you have given? This is an important point.

Shri R. P. Sinha: I would like the Drug Controller to examine the reasons given there and give us a note as to whether the reasons that are given here are correct or not. Secondly, we in this Committee are to be guided by the time actually taken. We are not going behind the reasons. We have to go by the factual data available in this country. Based on that we will draw our own conclusion. We want more help to correctly assess the situation. Based on that we will be guided by our own judgment.

Mr. Chairman: Before the manufacturer produces a particular drug, he has first of all to pass through the patent process. Then he must obtain clearance from you. Then he has to get clearance from the Industries (Development and Regulations) Act. Is there anything else?

Shri S. K. Borkar: So far as regulations are concerned, these are the only three.

Shri R. P. Sinha: The fourth one is obtaining foreign exchange.

Mr. Chairman: Please give us an idea of the time each of these takes.

Shri R. P. Sinha: We have to go by the actual position. We should not proceed on theoretical basis.

Mr. Chairman: You take two or three patent drugs and give us what time each has taken.

Dr. C. B. Singh: This is an important point. Otherwise we will be groping all the time in the air.

Mr. Chairman Then he has to obtain the raw-materials; then machinery. Please give us a note on all these.

Dr. C. B. Singh: The Health Ministry has produced before us a comparative statement showing the prices of drugs in India and Pakistan. First of all, is there a patent law in Pakistan.

Shri S. K. Borkar: The patent law is the same there. Both of us inherited it from the British.

Dr. C. B. Singh: What according to you is the reason why the drug is cheap in Pakistan? Will you be able to throw some light on this?

Shri S. K. Borkar: That will be a hazardous guess on my part.

Shri R. P. Sinha: Then we can adopt the same method here also.

Shri S. K. Borkar: Perhaps the importer brings it at a lower price.

Shri R. P. Sinha: Please don't say 'perhaps'.

Dr. C. B. Singh: How many of the drugs are locally manufactured?

Shri S. K. Borkar: About India I can give this information. None of these drugs mentioned here under Imperial Chemicals is manufactured here. All of them are imported. Even the basic drug is imported.

Dr. C. B. Singh: Do you think that the import duty and customs are lower there?

Shri S. K. Borkar: I won't be able to say.

Shri R. P. Sinha: Will it be possible to find out?

Dr. C. B. Singh: This information may be gathered by your office. This is important.

Mr. Chairman: With the present relationship with Pakistan, we do not known whether we will get the information. Anyhow they will try.

Dr. C. B. Singh: Thank you. This is a statement giving the comparative prices of drugs in several countries. It is commonly said that the prices of drugs in this country are the highest. If you see this statement you will find that it is not a fact.

Shri S. K. Borkar: I will go through these figures. My guess is that in absolute terms you may be right. But in terms of the earning capacity, they are very high.

Shri R. P. Sinha: I could not follow.

Shri S. K. Borkar: If a drug costs in the United States five dollars, then that amount can be converted into rupees at the pre-devaluation rate and then you get Rs. 22. This drug may cost in India Rs. 18. On this basis you may say that it costs less in India than in the United States. But that is a fallacy because in India to earn Rs. 18 an average man has to work for ten days. From that point of view the price in India is very high. We shall not go by the absolute figures that may be available.

Dr. C. B. Singh: I think these are your figures. It gives you a comparison of current domestic and comparative prices in USA, Germany, Italy, Japan and India.

Shri S. K. Borkar: It is not mine.

Dr. C. B. Singh: These are the figures which are supplied to us by the office. Here we find that the prices of these drugs in India—with the exception of one or two countries—are lower than in many other countries.

Shri R. P. Sinha: If the earning capacity is less, if the cost of production of drugs in India is more, the selling price will also be more; because the selling price has to be equated with the cost of production.

Dr. C. B. Singh: Let his study and give the reply. This is an important point.

Shri R. P. Sinha: Mr. Chairman, I have only one question for you, and not for the witness.

Mr. Chairman: I am not an expert.

Shri R. P. Sinha: From the way you put questions, I can say you know much more than what we know. The point to make is this. They are Government witnesses. They are part of the same Government machinery, whether it is the Health Ministry or whether it is the Ministry of Industries.

Mr. Chairman: Birds of the same species!

Shri R. P. Sinha: Now, for us it becomes very difficult if we get two different sets of facts from the Ministry of Health and from the Ministry of Industry. I would like to have your ruling. I suggest that both the officers of the Ministry of Industry and the Ministry of Health sit together and check up the facts, instead of giving contradictory facts—I think in the presence of Shri Venkatachalam. Let us first bring out the facts. They have given two different sets of figures. Mr. Shah yesterday deposed before us that the production is two-third from the basic stage and we permit only such quantities of bulk imports of such drugs which are now being manufactured here. Now, he

says that ICI are only formulating drugs and they are not making any basic drugs. Two different statements are being made by two Government offices. I would like you to appreciate my difficulty. I suggest that both the officers of the Ministry should sit together and sort out among themselves and tell us what the facts are. I will illustrate. From where the manufacture is started? What is the quantum of manufacture of basic drugs here? They say something and they say something else. Both are quoting documents. Both cannot be correct. Evidence has been recorded and they have given statements which are contradicting each other on facts—on price, on formulas, on fact wherefrom the basic manufacture starts.

Shri Bibhuti Mishra: It is beyond our scope.

Mr. Chairman: It is all right.

Dr. C. B. Singh: One more question—important one. You know Prof. Kilbridge from USA has produced before us a chart which shows that the prices of patented drugs available in the general market have fallen over a number of years while the prices of non-patented drugs have more or less remained the same. Are you in a position to give your opinion on that?

Shri S. K. Borkar: I do not know the basis on which the Professor made the statement. But our experience is—I can support by facts—that drugs which are patented remain at a high level though in course of time they come down, but generally they remain at a high pitch. When the Japanese delegation came, they also gave some graphs and if we see those graphs we will find that there are certain drugs and that the prices of patented drugs remain at a high level I can give you one concrete example. I will take the question of Tetracyclines—a life-saving drug. Its price was Rs. 3000 per Kg.....

Dr. C. B. Singh: We are not discussing this point.

Mr. Chairman: Let him finish.

Shri S. K. Borkar: The price did fall down. Today it is about Rs. 1157 per Kg. There is no doubt there has been a fall here, but the fall has not been appreciable as compared with the non-patent drugs. Penicillin, which is not patented, sells even in this country at 40 paise per m.u. If it is imported, it is 6 paise per m.u. In the case of non-patented drugs there is a steep fall in prices as against the patented drugs, and to support my submission. I can submit definite information on the patented as well as non-patented drugs.

Dr. C. B. Singh: I will like Mr. Borkar to give us a graph of the cost of non-patented drugs and patented drugs for the last ten years in this country. I will be sastisfied.

Shri S. K. Borkar: I will do that.

Shri Prabhu Dayal Himatsingka: Penicillin is being manufactured by Government?

Shri S. K. Borkar: Both Government as well as private sectors.

Shri Prabhu Dayal Himatsingka: Government charges the same price as private sector?

Shri S. K. Borkar: Almost the same.

Shri Prabhu Dayal Himatsingka: The cost must be more; that is why they are charging more?

Shri S. K. Borkar: Might be. We may not have the latestest technology on Penicillin. But the fact is that prices are higher here than of imported Penicillin.

Shri Prabhu Dayal Himatsingka: Patent or no patent; the position is that because we cannot produce cheaper things, therefore the price is high? Patent does not come in the way?

Shri S. K. Borkar: Patent is only one of the contributory factors.

Shri Prabhu Dayal Himatsingka: Just assume that if there is a patented drug and the manufacturer says 'well, you are free to manufacture it'; can it be manufactured without some know-how being given by the party who had been manufacturing it?

Shri S. K. Borkar: That depends upon the drug. If it is entirely new, it will be difficult to manufacture with our old units without the know-how. There are a large number of drugs which could be manufactured and they are being manufactured even today by a process which has been developed in our own country.

Shri Prabhu Dayal Himatsingka: If the process is only patented, and not the drug, then there is no difficulty in manufacturing this drug?

Shri S. K. Brokar: There should be no difficulty, excepting, of course, if it requires entirely new techonology, such as the anti-cancer drugs, in which case it may be initially difficult for our own people to do it on their own.

Shri Prabhu Dayal Himatsingka: The delay in introducing a drug manufactured here may be due to many factors and these factors will always be there. You will agree that if a drug is manufactured, having been manufactured the manufacturers will certainly be anxious to put it in the market as quickly as possible. He will also try to find all possible ways He would not be a party to the delay?

Shri S. K. Borkar: This is an assumption. Naturally the manufacturer will see to the profitability of it. If the size of the market is small and his investment is relatively large, he may try to postpone the manufacture of the drug till such time as the market develops. That condition will always be there.

Shri Kashi Ram Gupta: The witness has stated that out of Rs. 150 crores worth of drugs about Rs. 60 crores wroth of drugs include patented drugs —may be in proportions. Now, how much of it is such which is totally patented drug and how much is there where ingredients are there in large proportions.

Shri S. K. Borkar: That will have to be worked out. If I have a multiple composition preparation, for instance, a tablet containing Aspirin....

Mr. Chairman: You may not give for each tablet but on the whole.

Shri Kashi Ram Gupta: My question is: how much out of these Rs. 60 crores worth of drugs—what percentage—are patented drugs.

Shri S. K. Borkar: I could give the exact information later but just to give the Committee an idea—I have taken production in 1965 of about 21 drugs—the cost of basic drug, as such, when manufactured here is Rs. 15.7 crores. If they were imported they will cost us Rs. 5.3 crores. When these drugs are formulated into products and sold in the market the total sales turnover is worth Rs. 61.2 crores.

Shri Kashi Ram Gupta: So it comes to 1/4 of the total production. Now, there are two kinds—onewhich can be used on a mass scale and the other which can be used in a particular disease. Can you categorise the value of these in these two categories, that is, how much is there which is used in mass scale and how much is there which is used in a particular or specific disease?

Shri S. K. Borkar: The items mentioned earlier,most of them, are used in mass-scale except for two or three. If the Member insists I can work out.

Shri Kashi Ram Gupta: Please work out and send it to us.

You are well aware that uptil now patents have been taken by foreign

concerns and under the present Bill we are hoping that our own people will be able to come forward and have new patents. Are you in agreement with this idea of the present Bill or not?

Shri S. K. Borkar: Sir, our own people may not come forward for patents but the provisions of the Bill will enable them to manufacture the drugs here which are already known and patented. To be able to patent it must be entirely a new drug and that may take some time before our industry develops to that extent but the provisions of the Bill certainly will enable them to put up their own plants.

Mr. Chairman: So far as you are concerned you are in favour of this Bill.

Shri S. K. Borkar: Subject to the remarks I made in the beginning.

Shri Kashi Ram Gupta: The main point is: the witness says that they may not be able to have new patents whereas the purpose of the Bill is to enable them to have patents. That is the first purpose of the Bill and when he says they may not come forward..

Mr. Chairman: That may take some time but they will come forward.

Shri Kashi Ram Gupta: After what time they will be able to come forward.

Shri S. K. Borkar: That will depend on how our research progresses? How much money we are able to spend on research?

Shri Kashi Ram Gupta: Until and unless we specifically know where we stand....

Mr. Chairman: By and large this Bill will promote research and development and he says that this Bill is allright.

Shri Kashi Ram Gupta: My next question is: One is the invention side of it and the other is production side of the present drugs. Now are you of the opinion that a clause like this may be put: 'That those who invent in this country may be given greater period and those who do not invent in this country may be given a smaller period'. Are you in favour of such a clause?

Shri S. K. Borkar: There should be uniformity. If you go for one principle that should be uniform. I personaly am not for discrimination.

Shri Kashi Ram Gupta: What is generally the period taken by your Department for giving a certificate to put the drug in the market? Does it vary from drug to drug or is it uniform?

Shri S. K. Borkar: It does vary from 9 months to 3 years.

Shri Kashi Ram Gupta: Has it been compared with other countries?

Shri S. K. Borkar: Two years, I said, was the average. There are many drugs which have to be tried for longer period but the average comes to 2 years.

Shri Kashi Ram Gupta: It means it may take even three years. Have you got a list of such patented drugs which are in mass use and which are used for very important diseases and which are required at such intervals when such diseases occur. Have you got a list of such medicines?

Shri S. K. Borkar: I have got a list but that list is not exhaustive. I do have a list but I do not have the complete information about every drug that has been patented in this country

Shri Kashi Ram Gupta: You may scrutinise the list and categorise.

Mr. Chairman: What is the use?

Shri Kashi Ram Gupta: It will be useful for us in determining the period.

Shri P. C. Borooah: You are a Drug Controller for a long time and one of your main functions is to see that spurious drugs and sub-standard drugs do not find their way in the market. Are you satisfied that in the present Bill enough has been provided in regard to that?

Mr. Chairman: This is a patent bill and not drug control bill. We are not concerned with it.

Shri P. C. Borooah: Are you satisfied that the Bill, as drafted, will go, at least, to some way in putting down the spurious and sub-standard drugs?

Mr. Chairman: There is nothing he has to say.

Shri P. C. Borooah: If you have no suggestion that means you are fully satisfied—

Mr. Chairman: Does this Bill in any way help in controlling the spurious drugs?

Shri S. K. Borkar: It is entirely a different aspect.

Shri R. P. Sinha: I would like to know what does the Controller think as to the impact of patents on the price structure of the drugs?

Shri S. K. Borkar: Sir, the impact of patents on price structure is that the prices of drugs are high and they are maintained at a high level for a considerable time.

Shri R. P. Sinha: I want to know: (i) whether it is a fact that our drug prices have been pitched at 1963 prices level; (ii) while determining the prices the machinery of the Government—whether it is Drug Controller or Ministry of Industry—go into the entire cost structure of the drugs and then they fix up the price at which any particular drug will be sold. If that is so, how can we complain that the patent system is responsible for the high prices? If the Government is satisfied that there is profiteering going on in a patented drug can they not force that manufacturer to bring down the price? Do they not take into account the cost structure while determining the price of any drug under the Essential Commodities Act?

Shri S. K. Borkar: Sir, the first part of the question relates to the pegging of the prices at the level of April, 1963. This was done under the Defence of India Regulations and now it has been done under the Essential Commodities Act. All that the Government at that time, following Chinese aggression, did was to accept the prices as were available in April, 1963 and they did not question the price structure of the manufacturers. The anxiety of the Government was to see that there was no further rise in the prices of drugs. Government had not determined the cost or price structure of those drugs.

In regard to the second part of the question, Sir, to determine the cost structure of a patented drug requires a large machinery. Now a patent drug is assumed to be a new drug for which you cannot have a parallel to compare even the prices. It is only when you have a corresponding drug with which you can compare that you can arrive at some approximation of price but in the case of an entirely new drug it is not possible unless a Body like Tariff Commission goes into the question.

Shri R. P. Sinha: One of the main complaints is that because of patents the prices of the patented drugs are high. Now, I would like to understand from the Drug Controller whether he has got enough powers under his armoury, under the various laws, under the Defence of India Rules or Essential Commodities Act so that when he feels that a particular set of drugs or a particular new drug or a patented drug is

selling at a very high price and the particular manufacturer is profiteering he can enquire into the cost structure of that particular drug or he does not have any control over the selling price?

Shri S. K. Borkar: So far as the Drug Controller is concerned he does not have the powers. The Government does have both under the Industries (Development and Regulation) Act and also under the Essential Commodities Act.

Mr. Chairman: Government has powers....

Shri S. K. Borkar: It is the Ministry of Industry and Petroleum and Chemicals.

Mr. Chairman: And you don't have powers.

Shri S. K. Borkar: I do not have.

Shri R. P. Sinha: He may not have the power. What I want to understand, to check up my own self, is if a patented drug is there of which the Drug Controller brings to the notice of the Government that a particular manufacturer is charging high and we have got the machinery to control the price of that drug. So, we can very safely construe that the patent cannot stand in the way of bringing down the price of any patented drug.

Here is a statement which has been given by the Drug Controller in which he has given a list of the drugs with the quantity of imported drugs and the indigenously manufactured; then he has given the retail price and sale value. Could you tell us to which period it refers to?

Shri S. K. Borkar: The figures in the statement pertain to 1965 and this was compiled only recently.

Shri R. P. Sinha: The figures given in the statement refer to 1965. Now, I would like to know whether you have given the retail prices of all these things. If so, can you give us the cost of production of some of the items to see whether the retail prices are proper or not; or they are reasonable or unreasonable.

Shri S. K. Borkar: This statement was prepared with a specific purpose of giving information to the Committee as to the extent to which patented drug figures in the overall turnover of the drugs.

Shri R. P. Sinha: Do you mean to say that all the names of the drugs mentioned here are of patented drugs?

Shri S. K. Borkar: Yes, Sir.

Shri R. P. Sinha: The retail prices are given here. Whether the retail prices of patented drugs are reasonable or unreasonable? All these prices mentioned here, I presume, must be prices as settled by Government.

Shri S. K. Borkar: No, Sir. They are those that are given in the price-lists of the manufacturers.

Shri R. P. Sinha: If the manufacturers charge more price than 1963 price, you will always come on their head.

Shri S. K. Borkar: That is correct. One can presume that these were also the prices which were available in 1963.

Shri R. P. Sinha: Quite right. May I know whether this is the retail price as approved by Government of India under the Defence of India Rules?

Shri S. K. Borkar: I would not call it as approved price but as pegged price.

Mr. Chairman: Does it mean that that is what is accepted by the manufacturers?

Shri S. K. Borkar: It does mean. But, the Government does not go through the price structure.

Shri K. V. Venkatachalam: Just prior to the Chinese invasion, certain prices were in force. Government, at that time, wanted to see that there was no unreasonable rise in prices. They used the Defence of India Act to peg those prices at that level. So, it is not correct to say that there has been an investigation into prices and you cannot take it that the Government has agreed that those prices were reasonable.

Shri R. P. Sinha: Prices which are given in this statement are those that have been pegged under the Defence of India Rules, 1963.

Shri S. K. Borkar: I would not like to answer this question. I would only say that for such of them as were marketed in 1963, the prices were the same as were prevailing at that time.

Shri R. P. Sinha: This is the pegged price of those items.

Shri S. K. Borkar: That is correct.

Shri R. P. Sinha: Am I correct to assume—this is my misunderstanding—that if a new drug comes out, under the Essential Commodities Act, you have got to obtain the sanction of the Government before fixing the prices?

Shri S. K. Borkar: It is so now.

Shri R. P. Sinha: Nobody can market any drug without getting the prior approval of the Government.

Shri S. K. Borkar: That is correct.

Shri R. P. Sinha: I think all those items have got the approval in that sense.

Shri S. K. Borkar: No, Sir. These are the prices of drugs as in 1963.

Shri R. P. Sinha: I know that. There was also a press report that many manufacturers wanted the price to be raised again because the production cost had gone up. There are many new things which have come out in the field. They wanted the approval of the Government of India. I presume that for every drug that is marketed in India, the prices are checked and approved by the appropriate ministry. Are these figures in the statement related to those drugs?

Shri S. K. Borkar: I will explain that. Those figures that are shown here relate to the price-lists that were available to 1963. At that time, the Defence of India Rules did not require probing into the prices. Now that is required under the Essential Commodities Act.

Shri R. P. Sinha: Will you kindly send us the price-lists to check up whether these are correct figures or some variations have taken place.

Shri S. K. Borkar: Are you talking of the approved price-lists?

Shri R. P. Sinha: I am talking about the items which are mentioned in the lists.

Mr. Chairman: How could that help us?

Shri R. P. Sinha: I would like to have the list as approved under the essential Commodities Act for patented drugs as mentioned here.

Shri S. K. Borkar: We do not have the approved prices of the drugs. These are the prices fixed under the Essential Commodities Act. At the moment the re is not a single preparation which has been examined and price determined under the Essential Commoditions Act.

Mr. Chairman: Government has not fixed any price.

Shri S. K. Borkar: They have not fixed any price.

Shri R. P. Sinha: But, the Government have powers to go into the cost structure of any drug.

Shri S. K. Borkar: Yes, Sir.

Shri R. P. Sinha: I would like you to refer to this statement. Let me draw your attention to column 5 in which you have given the quantity produced indigenously. You have given only three, four or five items which are being produced indigenously according to the statement. Am I to conclude that the rest of the items which are shown here are not being produced indigenously?

Shri S. K. Borkar: There are two or three items which are made indigenously *viz.*, Chlorpropamide (fourth from the bottom), Amodiaquin etc. I do not have the figures of the local production. That is why it does not figure in this statement.

Shri R. P. Sinha: Dr. Shah of the Ministry of Technical Development has also given some figures about these items. He says that most of these items are being manufactured and many more are going to be manufactured indigenously. Then, there are figures which I will give you There are certain items which, Dr. Shah says, are not included in the Fourth Five Year Plan. Number one is the first item 'Flouthane (Halothane)'. Next is the item 'Spiranolastone' on Page 2. The others are Chlordiazepoxide and Thioridazine on page 2. These are shown as not being manufactured. Now, what happens is this. Every product in this country is governed by the Industries Development Regulation Act. It is controlled by that. Only those items can be manufactured which get clearance from Government. I understand that the items that you have mentioned just now are being put in the Fourth Five Year Plan as to be manufactured. The Government would not like to manufacture them for the reasons best known to them. There are good reasons for that. There are other items also which have recently been included in the production programme. They are: Neomycin, Erythromycin, Triamcinolone and Ethisterone (page 2.) These are the new items which have recently been brought under the programme of manufacture. Industrial licensing procedure has undergone some change under which some have been given licences while others have not been given a licence. They have given us certain figures which were also circulated to us the other day. What is the target that has been fixed for that. Unless those figures are also given here, this statement of your's appears to be misleading. Therefore, what I suggest is: this statement given to us shows as to what are the items that are now being manufactured and What are the items that are now not being manufactured. Different things have come to us from different Ministries. Therefore, both of them should sit together and give us one set of figures so that there may not be any complaint later on.

Take item No. 3—Chloromphenicol—25 tons. One thing we have finalised is: the patent is not so important; it is not an important factor for controlling the price.

Mr. Chairman: We are not on the control of prices of drugs now. Your query may be interesting from that point of view. How is it important from our point of view—I do not know. We have to get whatever information we want on the Patents Bill.

Shri R. P. Sinha: Patents Bill is an instrument for bringing down the prices of drugs.

You may give that information afterwards.

Mr. Chairman: You are going far beyond the scope of the Bill.

Shri R. P. Sinha: The Patents Bill is an instrument for manufacturing any patented drug. What I say is that both the Ministries should sit together and give us a complete statement.

One Ministry says that the Patents Bill is important from the point of view of regulating production and controlling and regulating the prices.

Mr. Chairman: He has said that certain drugs have been sanctioned for manufacture here and others have not been sanctioned. Prices we are not concerned with. So far as the cost is concerned and so far as the manufacturing programme is concerned we have nothing to do.

Shri R. P. Sinha: I am glad you have confirmed this.

Mr. Chairman: Still you are pursuing.

Shri R. P. Sinha: As you have said, I will not pursue that. I would like to know from the learned witness something about the clinical tests. I would like him to explain to me how these clinical tests are being conducted and what are the different stages and how it works.

Shri S. K. Borkar: It is a test carried out on human beings to verify whether a particular drug about which certain claims are made is effective and whether it is safe. This, in substance, means clinical trial.

Shri R. P. Sinha: How do you do it. What are the stages?

Shri S. K. Borkar: First of all we screen the pharmacological data and the toxicity data. Once it is found that when used on animals the drug can be considered to be safe, it is then given to experts in the particular field. If it is a cardiac drug, then we send it to the specialist in cardiology and we prefer those institutions which are attached to medical colleges and hospitals so that a full-time officer there devotes himself to carry out the clinical trials. Then he chooses the patients under his supervision and finds out the defects in the drug. This takes quite a long time. Then there are certain drugs which are to be used for diseases which are life-companions like diabetes. The long term effects of these drugs have also to be found and it has to be seen. whether the kidneys or any other organs are affected. After the specialist is satisfied or if he is not satisfied, he gives his objection on the drug and he gives his recommendation that the drug has to be administered in such and suchway. If the investigator says that the drug is quite perfect but such and such precaution has to be taken the manufacturer takes note of it and mentions it in the literature so that any physician may know exactly how to administer that new drug.

Shri R. P. Sinha: I have read some books and I have found that in some of the new drugs which were experimented clinically in foreign countries, particularly, in America, they had a very bad effect on the progeny and after that they had become very strict in these matters. I also understand that these clinical test sometimes kill the patients. There is a lot of criticism against these clinical tests being done on human beings. We have, therefore, to be very very careful and not in a haste to get a new drug, especially at the cost of many patients Therefore, I would like that this clinical test should be not so much with a view to test its efficacy but it should be seen that no harm is done on the patients on whom the trial is being done. Keeping that in view—where that abundant precaution is necessary not to injure any patient who subjects himself to clinical tests, what do you consider should be the time for clinical test that because of the lack of facilities the time taken should be such not with a view to get a patented drug to commercial production quickly but to see that no harm is done to the patient and that maximum precaution is taken.

Shri S. K. Borkar: It will depend upon the nature of the drug. In acute diseases where there is some infec-

tion the chances of a drug being used will be only for a limited period—may be about a week; so the question of chronic toxicity of such a drug will not arise. On the other hand, in case of drugs such as hypotensives and anti-diabetics which are bound to be used frequently and continuously we must lay greater emphasis on the safety aspect. So, we cannot compare both the types of drugs in the same plane. Whereas in one case you require to be ultra-cautious to see that as a result of a long-term action there is no harm done, in the other case where the diseases are acute, you cannot prolong your trial to the same period. So there are types of drugs where this period will vary. That is why I said earlier that on an average our own experience is that the average is about 24 months.

Shri B. K. Das: In the beginning Mr. Borkar said that he is in favour of some compensation to be provided in the case of Government use. Can he give instances of other countries where such provision is there?

Shri S. K. Borkar: I won't be in a position to give that.

Shri B. K. Das: Cl. 48 there is no provision for compensation, but in clause 100 there is a provision. In that case, can you not do away with clause 48 altogether?

Shri S. K. Borkar: How it should be framed is a matter for the committee. But the principle, Sir, is this that Government should not be prevented in particluar circumstances to import a drug for their own use.

Mr. Chairman: Thank you, Mr. Borkar.

(The witness then withdrew).

II. (1) Dr. A. Joga Rao, Controller General of Patents and Designs, Government of India, Bombay.

(2) Shri R. V. Pai, Joint Controller of Patents and Designs, Calcutta.

(The witnesses were called in and they took their seats).

Mr. Chairman: Well, you know the formula; the evidence that you give is public and it will be printed, published and distributed to our members. Even if you want anything to be confidential, that will also be printed and distributed to our members. We have visited your institute and seen all the sections. What are your views about this Bill? Let us have a brief resume. Then members will put questions.

Dr. A. Joga Rao: I may be permitted to mention a little about my background prior to my joining as Controller-General in the department. That was about $3\frac{1}{2}$ years ago. Prior to that I had about 25 years of experience, as a scientific research worker, relating to both pure and applied sciences in the Government departments and in the CSIR. I was also for sometime in charge of the Central Salt and Marine Chemicals Research Institute and the Central Electro-Chemical Research Institute, under the CSIR. I had some acquaintance with work in the Defence Metallurgical Research Laboratory and one or two private sector laboratories, so that I have a little background about the importance of research and what exactly is meant by technical know-how with respect to particular industries, and what generally are the problems which we as research workers, and also as those responsible for the development of industries on an industrial scale, are up against. I may be permitted to introduce Mr. Pai, who is the Joint Controller of Patents and Designs; he holds a degree in Engineering from the Banaras Hindu University. Incidentally I also hold a doctorate of science from the Banaras Hindu University.

As far as the present Patents Bill is concerned, I have studied it not only from the point of view of the Act as

it exists in our country but also comparative legislations which are currently on the anvil or which have recently been passed, as in Canada and in Ireland, and also the manner in which the socialist countries of the Soviet bloc are trying to develop their industries, because all that has a bearing on this problem. The main purpose of patents, of course, is that it should help invention and the development and establishment of industries by way of giving incentives and so on. It is almost an axiomatic thing and it is more or less accepted by the developed countries that the original purpose for which the patent grants used to be made is no longer very much there and the reason has been beautifully summarised in just one or two paragraphs in the Melman's Report. I shall read out those paragraphs just now.

At the same time, the developed countries are still very actively thinking and very actively involving themselves in the ramifications and in making the clauses more and more sophisticated as far as the patents laws are concerned. For the consideration of grants of patents, one had to locate or identify the inventor; that was so back in the years probably a century ago when you had to locate the inventor because it was the individual initiative that counted.

That position has completely changed now if the researches in the modern times which are to be applied on a large-scale are to be considered. If you permit me, I may just read out one or two sentences . . .

Mr. Chairman: Now it has passed on to the hands of the manufacturers.

Dr. A. Joga Rao: Yes. The fundamental purpose for which these incentives are to be provided to the individual inventor for doing his best, is not so much served because it is really difficult in modern times of industrial development to really identify who is the inventor. It is a big problem, Co-operation, Collaboration, team-work and that kind of things are necessary now. In view of these things, it has assumed a different significance. Therefore, broadly speaking, the inventor nowadays may be regarded as the concern which is financing the research. So the definition of inventor which is required in some of these laws has to be carefully studied in the light of this.

Now I may read a few sentences from the foreword to Melman's Report, 1958. "The industrial and technological economy of today bears little resemblance to that of yesterday . . . The garret, garage, or basement inventor to a marked extent has given way to the laboratory technician who is both scientifically trained and versed in the latest techniques of experimentation and invention. The independent 'lone wolf' inventor"—Prof. Sir C. V. Raman used to put it as the 'lone furrow'; that is all right for fundamental research because it comes from intuition, but here it is a lot of development work—"has given way to the co-ordinated group activity of the research laboratory. What do these changes augur for the patent system? How shall the patent system respond the better to discharge its constitutional purposes? Professor Melman addresses himself to these issues . . .". I shall read the next important part—Prof. Melman is an Industrial Engineer himself of long standing of the Columbia University—" . . . The historical justification of a patent system is rooted in two propositions; first, that it is possible to identify the creators of new articles and techniques; second, that the privilege of exclusive property rights granted for a given period will yield a material return to the creators of new things . .". Two problems are at the centre of this study. What are the conditions under which technical knowledge is produced? The answer to this question should indicate whether it is indeed possible to identify inventors and inventions in a workable way. This problem is surely of more than formal interest, for the course of recent patent litigation has

indicated that the criteria for invention—often tied in with the identification of the inventor—lie at the heart of many cases in which patents granted by the United States Patents Office have been held invalid by the courts". He has given figures. "Of 50 inventions held invalid by the U.S. Court of Appeals, 43 were invalidated on grounds of "lack of invention or anticipation". The second problem of the enquiry was: "what has been the effect of the patent system on the promotion of science and useful arts. This question is a critical criterion for the evaluation of the function of the patent system. Clearly, it is possible to suggest many criteria by which to evaluate an institution like the patent system". Now what he goes on to say is, undoubtedly the system of patents may be necessary and is necessary for the establishment of industries, for the development of industries by so many other ways but not necessarily by providing incentive to "inventors". This is how he puts it: "Patent arrangements have far reaching effects on economic institutions, on property relations, on profits of industrial firms, on concentration of control in industry, on monopolistic practices (anti-trust policy), on the role of Government as a decision-maker in industry, and on the scope and characteristics of the legal profession. Any one of these areas of effects could be utilised for the purpose of evaluating the functioning of the patent system." In other words, he does not dismiss the patent system as worthless. It is very useful from those points and for those purposes. But the fundamental point and the basic idea with which the patent system originally came into existence is not served. That is, granting of patent will enable more inventions to flow out from the individual inventor. It need not. It can flow, of course, from a team-work; for that purpose of course, the patent system is very necessary. And for enabling foreign investment and other things also, the patent will serve as a very good means for negotiations and other things. That is the value of the patent system and it is for these reasons that the Judge, considering all the aspects, had decided that we must have the patent law. Of course, each country of the world is constantly revising its patent laws to suit the current circumstances and the current needs. There is nothing wrong in it. Now, our Patents Bill, as far as I have seen, therefore, serves that purpose in the present context of circumstances and probably at any time afterwards, changes will have to be brought about and may be brought about even after the Bill is passed into law, just as various other countries are doing.

Again, this team-work is very important in foreign countries. It has not yet developed in our country. Still here we have to look for an occasional individual incentive and so on. How best this can be done may be a fairly important question in the present level of the development of the country. For this kind of thing in the USSR, what they have established is an Inventor Certificate. The United Nations, the Paris Convention and all the important international agencies and various other developed countries have also recognised these Inventor Certificates as at a par and equivalent to the patents, and that is how the USSR became member of the Paris Convention.

Mr. Chairman: What is actually an Inventor Certificate. Can you give us an idea?

Dr. A. Joga Rao: An Inventor Certificate often arises from the effort of a single individual inventor by reason of his own skill. The right of inventor certificate automatically vests in the State in return for some consideration and recognition which the State accords to the inventor. He himself cannot exploit it in any way he likes, *viz.*, by establishing industry and all that. The Soviet citizen can still have it exploited provided it is approved and for approving it they send it to their workshop and when favourable report from the workshop comes, then it can be used. But he

has no rights at all. If he wants the right of exploitation, he has to apply for patents and he is free to take a patent. The only difference is that in the case of Inventor Certificate, the charges that are paid are absolutely negligible or 'Nil' for the grant of the Inventor Certificate. But for the grant of patent the charges are exorbitant.

Mr. Chairman: What is the use of the Inventor or Authorship Certificate to the inventor?

Dr. A. Joga Rao: The use is like this. He gets monetary reward from the State, he gets a roll of honour, he gets credit and recognition for it. Another aspect in which also we may have some kind of similarity is the smaller inventions which are more possible in our country because of various reasons. (It is very difficult to have more sophisticated inventions here). For these small inventions in the USSR, they give rationalisation proposals. They are legally recognised, and they are less than the Inventor Certificate in their worth and magnitude. Possibly that kind of thing might be useful in some of the developing countries. Then as far as the Patents Office is concerned, any details of course of a procedural nature or factual data, Mr. Pai will be able to give. He is directly incharge of the Patent Office. In my capacity as C.G., I am in charge of both the Trade Mark Registry and its branches and the Patent Office; the various offices are day to day administered by the Joint Controller and the Joint Registrar.

I have noted down a few important points relating to the clauses, a few which might involve procedural matters, a few which might involve administrative complexities in the administration of these particular provisions when the Act is brought into force and a few others which are of policy nature, in which I have nothing to say as that is Government policy, and a few, of course, are verbal changes here and there of a drafting nature or typographical nature. These I have noted and I shall submit these.

Mr. Chairman: If you could give any suggestions regarding how we can improve the Bill. That also you may give.

Dr. C. B. Singh: Mr. Joga Rao said just now he has got certain suggestions. Will it be possible to give them to the Members of the Committee. It will be helpful.

Dr. A Joga Rao: I have no suggestions. Some provisions which are of a procedural nature . . .

Dr. C. B. Singh: Whatever it is.

Mr. Chairman: I have you got anything more to say.

Dr. A. Joga Rai: No, Sir.

Shri Bibhuti Mishra: What is the total number of patents and out of these how many patents are Indian, how many in collaboration and how many foreigners?

Dr. A. Joga Rao: The total number of patents so far granted is about 67,000. Out of these, roughly 10 per cent are Indians and between 87 or 88 to 91 per cent are foreigners. This ratio has remained practically the same throughout the First Plan period, Second Plan period and the Third Plan period.

Shri Kashi Ram Gupta: Is this the total for drugs? He wants for drugs.

Dr. A. Joga Rao: I have got the data from 1912 to 1965. The total number of patents so far granted is 75,000. Of these 7,700 and odd are Indian and about 67,000 foreigners, *i.e.*, a ratio of 1 : 9.

From 1912 to 1965 this is the ratio.

Now, patents granted for drugs and medicines: Indian—386 and foreign 8,000. The ratio is 1:20. This is an interesting fact. While the Indian inventive skill or Indian investment in

other industries is fairly good, in pharmaceutical industry it is not upto that mark.

But I must mention that a similar ratio generally does prevail in all the countries with the exception of West Germany, Japan and USA. That is for the simple reason that soon after the invention, the inventor applies to 70 or 80 countries and takes patents there. Sometimes he applies for patent even for an invention which he knows is useless and which he is not going to exploit. Why? Because he does not want others to tread on his toes.

Then, patents other than for drugs: The total number of patents in force as on January 1966 is 31,000. Out of these 31,000 the ratio of Indian to foreign is: 1:11. Out of this the ratio in respect of drugs and medicines is 1:30.

Shri K. V. Venkatachalam: You can give the absolute figures and that statement you can circulate.

Shri Bibhuti Mishra: To what extent these foreigners have been helpful to make Indians now know the know-how and develop Indian industry regarding drugs and other things?

Dr. A. Joga Rao: It is a very important point. There are three or four ways in which they can help. One, they can set up full-fledged research institutions in the country. They have not done it except that CIBA have set up an excellent research laboratory for pharmaceutical and drug research near Bombay.

Dr. C. B. Singh: Pfizer has done in Chandigarh.

Dr. Joga Rao: That is only for production. They are anxious to set up factories to produce. Sandoz and Glaxo have done it.

Secondly, they can enter into collaboration agreements for starting factories where Indians and foreigners have some kind of participation. The Punjab Government have given to the Pfizer's some facilities for this in the form of land, water, local amenities etc. They are running it in Chandigarh. When I look at some of the factories what impresses me is that our own young men are fully manning these institutions. They are in complete charge. They are really the masters of the show as far as production aspects are concerned.

Shri Bibhuti Mishra: We have visited this in Chandigarh. They are doing it with selfish motive because our boys can only manage other's factories.

Dr. A. Joga Rao: I am not denying it. But incidentally, at least as a by-product, our people do learn and get some kind of acquaintance with the job.

The third kind of help they can do is to give some kind of grant to some of the research establishments here or invite some of these people to foreign countries for giving them training. But this is very insignificant.

Shri Bibhuti Mishra: Is it not a fact that Pfizer's perior has expired and still they are doing it?

Dr. A. Joga Rao: Yes.

Shri Bibhuti Mishra: How far this Patents Bill is helpful to develop our industry?

Dr. A. Joga Rao: It is helpful because it gives large powers to the Government while it does not deny patents. It enables others just to walk into the country for the purpose of securing patents. Having secured patents and having divulged their specifications, at any stage, it is possible for the Government to control some of these factories which they set up, on payment or without payment.

Dr. C. B. Singh: We are not trying to do that.

Shri Bibhuti Mishra: In Ayurveda they do not get their medicines patented. They have got a formula for Chyavanaprash, Yogaraj, etc. and anybody can see that formula and manufacture these medicines in their own way. But this patent here is a sort of monopoly. How is it? It is because of the materialistic view of people.

Dr. A. Joga Rao: I am not very competent to say on Ayurveda. What they do in Ayurveda is like this. There are books like Chintamani and Sarangadhara Samhita etc. They contained most of these yogas. In those days even the wives in a family used to prepare medicines. My grandfather used to prepare medicines and his brothers also prepared them. If they could not get Amalaka for a particular medicine, they had recourse to substitute because it is prescribed somewhere else or they thought it was useful. For instance, Sataputha Abhraka used to be prepared using cow-dung cakes as fuel. But modern people may use electric furnace for the same, rightly or wrongly. Now in the case of modern industry also, for instance, if a more competent scientist were to take up to the application of the modern technology, to the implementation of the requirements as given in these books, it is possible because by appropriate regulation of electrical controls the temperature can still be regulated and can be controlled. There are some who try to go in for substitution. Now, in the matter of patents the specifications, of course, are laid bare. anybody can get a copy of it easily for one rupee or two rupees or five rupees in any country. There is no control. But the question here is having got a patent specification, in what industries is it possible, and for what type of countries to straightaway set up production, which they can do, of course, in case they have no patent law, and in what kind of industries and in what kind of setup of a country can it not be done, even if all the specifications are laid before them? I tell you, for example, in the case of metallurgical industries, it is possible for our country to do it provided the law does not come in the way. Alloys etc. have been grouped for two reasons. One, these we can produce based on the specifications or slight variation in the process. The other kind of things are more sophisticated. Even if the patent specifications are laid bare for us, it would not be possible, and therefore for these things we do not want to give any kind of patent rights for the products. There is nothing strange in this. Many of the foreign and developed countries have also similar exceptions and this is nothing unuseual. It is decided by the Government in, what they call, public interest. What public interest is and how it is to be estimated are very complex matters.

Mr. Chairman: Which are the foreign countries?

Dr. A. Joga Rao: Germany, Neitherlands, Austria. These are there in the statement which was originally submitted to the committee. If necessary, we can submit a complete list.

Shri Bibhuti Mishra: Practically the period for patents is from 8 to 10 years. One gentleman said that it should be seven years. What is your opinion?

Dr. A. Joga Rao: The period was 14 years in India in 1930 and before. It is only in 1930 or after that it became 16 years. But then we had a different set-up and a regime. Possibly each Government looks on these in different ways and they bring out regulations, such changes, as they think necessary in the contemporary state of affairs. So 16 years is now being brought back to 14 years. I do not think it is unreasonable, though a matter of fact, there is a general trend in international circles to push it up to 20 years. Many countries which had lower periods in the past have now begun to replace it.

Shri Bibhuti Mishra: Do you think that even after granting patents,

Dr. A. Joga Rao: The law of universal novelty as opposed to local novelty is of a highly important nature and most valuable. The Government guarantees the patent as far as novelty and all the things are concerned. In West Germany they have universal novelty and along with that the guarantee is also there. In our country we have accepted that part of the process, but the Government does not give guarantee. But all the same once we do the worldwide novelty search at the examination stage, the value of patent is enormously enhanced. To the extent I have studied this problem, in this process of worldwide novelty, things get bogged down and there are delays of 3 to 5 years even, for acceptance. Unless the novelty is determined, neither it is accepted nor refused. It is estimated that one million applications will be the back-log by 1980 in the U.S.A., they give the figures of back-log for the year 1970 and also 1980. Therefore, the general trend has been more or less to step down from the universal novelty to local novelty or to mere registration of patents. That will not give any value to the patent, though it may have financial or other usefulness. The trend of thinking seems to be that the Government is allowing patents to be granted and if it is a wrong patent it will go into the dust-bin and if it is a worthwhile patent, somebody will exploit it. We in the examination stage cannot undertake this stupendous amount of work which may lead to 5 years back-log. Another alternative is to introduce mechanised searching system, mechanised computorise system, just as is done for administrative studies, even for novelty search, limiting for the time being to certain categories. This of course is a helpful thing, but it is a costly thing. Japan has started this recently as an experimental measure in 4, 5 categories.

On novelty examination—just like a computorised system—this is also being done. I think that in Sweden, they have got an equipment for that. They have been making experiments on that. Experiments have been started in one or two countries.

Some countries have introduced what is known as "deferred examination system". Under this system, a patent need not be examined as and when it is filed. It is only after five years that they will take it up for examination. During these five years, unless any other party evinces any interest, they don't examine. So, less examination work devolves upon the Patent Office. They are already overburdened with their work. What is known as "common searching system" is prevalent in the Scandinavian countries where they receive scores of applications. E. C. M. countries have similar conventions. Swiss have their own conventions. They also receive scores of applications. Their Patent Laws' aim is that they can pool their resources so that the examination work can be shared more or less by all. If one country examines a certain thing, others can accept their findings more or less. The International Patent Institute at the Hague undertakes examination on novelty on payment under the Paris Convention. The general trend in all these things is to give this up more or less. As a matter of fact, in Netherlands, they have given this up; West Germany is also going to give up the 'universal novelty examination.'

Shri Kashi Ram Gupta: May I know whether the period for acceptance includes the period for novelty examination as well?

Dr. A. Joga Rao: Yes, Sir.

Shri Kashi Ram Gupta: Fifteen months are there within which the examination should be completed.

Dr. A. Joga Rao: Yes, Sir. From the date of completion of specification it should be completed.

Shri Kashi Ram Gupta: Just now you have said that if we put the period for the date of selling, it may

not be possible to complete the examination. How much time does this take?

Dr. A. Joga Rao: I am sorry there is a mistake in what I said. With Chairman's permission let me correct that. The period is 15 months from the date of the examination report from the Patents Office and not from the date of completion of specification.

Shri Kashi Ram Gupta: What is the time taken for the date of sealing?

Dr. A. Joga Rao: That time can be indefinite. Because of the worldwide novelty, it has to be left like that.

Shri Kashi Ram Gupta: The time is indefinite; we don't guarantee the period for the date of sealing. From the date of specification, it may take years together till final sealing is done. We have got ten years period from the date of completion of specification. That means the period is practically over.

Dr. A. Joga Rao: My submission on this is that in any case even if the time is statutorily fixed as 16 years, for a compulsory licence for example being granted to a party, there are so many other factors under which the compulsory licence is really issued to the party. The party may not be able to accept the case. Suppose there is a patentee. He goes on dragging his case for eight or ten years out of the 16 years statutory period. And ultimately, he wins his case. There will be only five or six years left. There are other causes and considerations also which reduce the effective term that a patentee may enjoy. We do not expect that this universal novelty will take inordinate time; we need not fix a time-limit.

Shri Kashi Ram Gupta: The model law has provided a clause for the period to begin from the date of sealing. If we begin the period from the date of sealing—whatever may be the period—then, the argument of the patentee will not be real that the period has been covered by litigation etc. There should be one way of safeguarding this interest. Are you in agreement with that?

Dr. A. Joga Rao: I was present at the deliberations, when the Model Law was discussed, as a Member from India. The Model Law was completely directed to helping such developing countries as are very much less developed than our country. It is not intended for a country like India which has a well-developed Patent system and which has a beautiful Statute and all the best experience, I believe, there are many other developing countries in the world. In Africa, for instance, a number of States have gained independence. Similarly, some States in other parts of the world, have just gained their nationhood. They do not have any such law. The model law is designed to improve their present stage of development.

Shri Kashi Ram Gupta: You have given an example that in Russia there is an inventor's certificate. Is there a group system also in Russia as is present in other countries?

Dr. A. Joga Rao: In the U.S.S.R., an inventor's certificate shall be granted only to an individual inventor. It is never granted to any group of persons.

Shri Kashi Ram Gupta: Whether the group system of research is there?

Dr. A. Joga Rao: Yes, Sir. There is some group system. The inventor's certificate is only to encourage the precocious persons who have rendered some account of themselves.

There are also what are known as rationalisation proposals which are of a lower order than the inventor's

certificate. In the U.S.S.R., they give some kind of credit to these things.

Shri Kashi Ram Gupta: In what way the present policy will accelerate basic research on medicines in our country?

Dr. A. Joga Rao: As I mentioned by way of general observations, no Patents Law either in this country or in any country can help in the making of inventions though it may help in the development of industry.

Shri Kashi Ram Gupta: My point is this that the group research is the main-stay of the industries these days. We have also to follow the group system in our country. In what way the Patent Law or Bill as it is can help us in the research?

Mr. Chairman: It can only help in formulations and developments of industries on basic research.

Dr. A. Joga Rao: It can help in one way. A big financier or a number of financiers can gather together and establish a good research centre and as any of the private foreign concerns are doing, patents can be taken of course in the name of that concern.

Shri Kashi Ram Gupta: My point is different. All the foreign concerns have an argument with them that they can establish research institutes on their own here provided a longer period is given. While the other's point of view is that we must have our own institute in India. It may be a subsidised institute even which may be do research work. We do not need any foreign research if the period of patent is to be increased. These are my points.

Dr. A. Joga Rao: The question is as to in what sector the research organisation will function better. This cannot be answered by me though I have some experience of it. Dr. Govindachari of the CIBA, the other day, did point out when this question was put to him. It seemed to him somehow that—he originally belonged to the Madras University Laboratory—certain conditions prevail there where he is working. That enabled not only him but many of the younger men also to undertake research in a cooperative way with a team-spirit. Team spirit is not so easy to obtain.

Shri Kashi Ram Gupta: The main point was this. Research is a main-stay for the drug industry. Which pattern is fit for our country he cannot very definitely say. That is my point.

Mr. Chairman: He has said enough on this.

Shri Kashi Ram Gupta: We would like to know as to whether research has anything to do with the period of the patent?

Dr. A. Joga Rao: I don't think it has.

Shri Kashi Ram Gupta: We have here in India at present some Institutes. Are you of the opinion that in future the research institutes shall have to be of the size as is prevalent in other countries or we need not copy other countries?

Dr. A. Joga Rao: We have already copied other countries in the matter of our Research institutes and as far as the equipment and laboratory facilities are concerned.

Shri Kashi Ram Gupta: Magnitude also?

Dr. A. Joga Rao: Yes, magnitude also. I can say that every Indian can really be proud of these National Laboratories from the point of view of equipment and other laboratory services, materials and especially working-space, for which they are very hard-pressed in those countries.

Dr. C. B. Singh: You are a graduate of Metallurgy from Banaras?

Dr. A. Joga Rao: I am a pure Electro-Chemistry M.Sc., not Metallurgy though I had occasion to study it.

Dr. C. B. Singh: Supposing your process or whatever processes you employ was patented by you, for what period for which you would like to have the benefit of it?

Dr. A. Joga Rao: In that particular patent I never thought of it.

Dr. C. B. Singh: You are so unfortunate—that I know. Have you become wiser? But we have got to think about the young men who are working. Supposing it was patented by you, what would you like to be the royalty or the period for the patent?

Dr. A. Joga Rao: Even if it was patented and even if the period was 20 years, in that particular instance I would not have benefited much because the lion's share would have gone to the organization of which I was an employee and for doing the research I was paid the salary.

Mr. Chairman: He is giving evidence here as Controller-General of Patents & Designs and not as an individual.

Dr. C. B. Singh: I am asking from an entirely scientific point of view. He made a great invention. If he made that invention on his own as many others have done, what would have been the period for the patent? Now for what period he would like the patent to be given to him?

Dr. A. Joga Rao: In the case of pharmaceutical patents, I believe it is not worthwhile to give a longer period even from the patentee's point of view. In the case of non-pharmaceutical industries like heavy industries I think it is worthwhile to give a longer period.

Dr. C. B. Singh: You said that in the case of pharmaceuticals it is not worthwhile. On what grounds you are basing this?

Dr. A. Joga Rao: The grounds are mostly those that I find in the rapid manner in which any drug, whether it is sulpha drug or whether it is anti-biotic, is more or less superseded faster by a further development and the further development is generally found to be better.

Dr. C. B. Singh: Here I have got an appendix—a statement. What time does it take for a firm to bring the product into the market after it has been sealed in the Patent Office?

Dr. A. Joga Rao: I am sorry—how can I say that?

Dr. C. B. Singh: Please see the comparative statement there.

Dr. A. Joga Rao: In USA it is stated that it takes one year; in India it is 9 years. The ratio is more or less like that.

Dr. C. B. Singh: It takes round about 8-9 years to bring the product in India to the market—majority of them like that. You said that you will not like them to be given a longer period.

Dr. A. Joga Rao: Once a patent is granted and once they have worked the technical know-how and set up the base—they can almost remove a chunk of land from Switzerland and set up a base here—if they are permitted, they will be able to put the product in the market within 2 years at the maximum though they are not able to do it now. Why they are taking 6 or 7 years—for that one has to look for reasons elsewhere.

Dr. C. B. Singh: What are the reasons elsewhere?

Dr. A. Joga Rao: That I cannot say because I do not know what are the reasons.

Dr. C. B. Singh: Without knowing them how do you say that the reasons are somewhere else.

Dr. A. Joga Rao: Elsewhere in the sense—in the necessity for permits, in the necessity for securing foreign exchange and in the necessity for having available the necessary land and other services nearby and also the technical base with which to start.

Dr. C. B. Singh: That is not connected with the Patents Bill.

After all you fix the period on a certain basis. It is not an arbitrary figure. That figure has got to be based on certain basic factors which go into operation.

Dr. A. Joga Rao: In this case some of these listed pharmaceutical products are anti-biotics. The question depends again on what particular product he wants to take the patent. If it is a completely new drug for the first time discovered and if it is to be put into the market, I doubt very much whether anybody would make any headway.

Dr. C. B. Singh: When we think about patent it is always a new drug. Patent means a new drug and a novelty something very new. We are talking about that novelty only. We are not talking about something which is produced somewhere else.

Dr. A. Joga Rao: These figures relate to the present position as uptill now. The question of novelty and worldwide novelty is involved when this Bill comes into force. Till now it is not necessary whether it is a new drug as far as the world is concerned. Only it is novel as far as India is concerned for the purpose of patentability.

Dr. C. B. Singh: In C1.87 there is a provision for licence of right. Have you any idea as to how many countries in the world have got this provision?

Dr. A. Joga Rao: This is an automatic endorsement—deemed to be automatic endorsement of licence of right. I don't think in that form it is there in any other country.

Dr. C. B. Singh: No country has got it—there I agree with you. Can you give any reason why we should have it here? You have come as an expert from the Government side. That is why I want you to tell us as to what are the reasons.

Dr. A. Joga Rao: My reasons are of course the Gov't views.

Mr. Chairman: That question we may better put to the Minister.

Shri P. C. Borooah: One of the important objects of the Bill is to provide incentives for inventions and also for development, and it is guided by two things: one is the time factor and the other is royalty. Some of us feel that this time factors is a bit too much. Suppose we cut down the time-limit and increase the rate of royalty. Will that serve the purpose of giving incentives? Or let there be less of royalty and increased time-limit. Which one would you prefer?

Dr. A. Joga Rao: It cannot be said which will be better uniformity or universally in respect of all kinds of inventions. But in the field of pharmaceuticals, food, drug or chemicals and alloys, where process patents are allowed and not product patents. I think it may be better to give a higher royalty; I am not suggesting that, but of the two, if one were to be selected, it would be better to give a higher royalty rather than increase the term for the simple reason that even if you increase the term, the manner in which the process is actually operated can become known fairly soon and by

slight variations in the process, it is possible for others more or less to copy that. Therefore, a patentee would prefer an increase in royalty rather than an increase in the term. That is what I feel in certain kinds of industries. It may be different in the case of other types of inventions.

Shri Kashi Ram Gupta: I am not able to understand his reply. Royalty is charged when there is compulsory licence and licence of right. Otherwise a patentee has no right to charge royalty. Royalty cannot be charged in all cases. Therefore, the period has nothing to do with the rate of royalty. There is no coordination between the two.

Shri R. P. Sinha: It has been said by many witnesses who have come before us—I am only talking about the Patent Office and patent procedures—that the whole process of granting a patent has been made so elaborate and cumbersome in this Bill that it will be very difficult for the applicants to furnish all the information. One or two instances were given that they have got to give all the information in different languages which the patent office will not be able to make use of unless they have a very elaborate system of translation. Then they have got to keep the patent office furnished within a certain prescribed time with all the suits that may be going on in other countries. Therefore, they say that the procedure should be more easy not only from the point of view of the applicants, but also from the point of view of the Patent Office itself. It has been represented to us that if the whole procedure is to be implemented, the Patent Office has to be expanded vastly. We have not got the resources—technical resources, not financial resources—to fully carry out the intentions of the Bill. Now what has the Patent Controller to say about this?

Dr. A. Joga Rao: I do agree that it is very necessary to grately fortify the Patent Office both in the matter of strength, that is numbers, as well as quality, that is at higher supervisory levels. Besides, extensive facilities will have to be given an sufficient finance provided in order to implement the various provisions. Some of the clauses which are of particular relevance to these administrative aspects of implementing the various provisions, I have got here, but it will take some time. I have also listed some of the matters where procedural changes in the provisions may be considered by the Committee without loss of any time to anybody, which will probably facitilate the work of the Patent Office well as the patent applicants . . .

Mr. Chairman: When we visited Calcutta, after we visited the Institute, I had a discussion with the Director-General and a note was distributed. I have also written to the Minister and the Minister, Mr. Sanjivayya has replied saying that he will consider those suggestions and take steps.

Shri R. P. Sinha: Now I would like to refer to the financial memorandum that has been drawn up in this Bill. Is that memorandum adequate, financially speaking, to fortify the Patent Office to the extent that is needed?

Mr. Chairman: That we will discuss with the Minister when he comes here.

Shri R. P. Sinha: What I feel is that the financial memorandum that has been given along with this Bill is not very adequate . . .

Mr. Chairman: Let us discuss it. Afterall he is an official. Let us discuss it with the Minister.

Shrn R. P. Sinha: We must have figures. This figure which is given to us is too little to carry the entire Bill

into effect. He must get what is the amount involved in the matter of expenditure.

Mr. Chairman: Can you give it?

Dr. A. Joga Rao: I was trying to put it this way. Rupees four lakhs as the recurring expenditure which, I think, we have mentioned in the financial memorandum, excluding a small sum—probably Rs. 20,000—for the non-recurring expenditure. But this provision relates to the financial requirements during the first year or so when the Bill actually is passed into Act and brought into force. The work has to develop and it has to develop in stages. So depending on the phase-wise or stage-wise development of the work, you will have to gradually enhance the financial provisions. I agree that the provision made here would appear to be rather small, but I submit that this would suffice during the first year or two. This would certainly need further strengthening afterwards and this could possibly be taken care of by the increased revenue that the Patent Office may get or may not be taken care of, because as the Judge mentioned in his report, this system of granting patents is to be regarded not as a revenue earning service but as a public utility service, and, therefore, about the financial aspect we need not very much think what it is going to be in the years to come. In the first one or two, probably that would suffice. Later it may have to be increased.

Shri B. K. Das: Then there are some provisions regarding appeal against the decisions of the Controller. Have you any comment on that?

Dr. A. Joga Rao: There are quite a number of appeal provisions. In fact the strong objection which most of the Memorandists from abroad have taken is on the basis of some kind of dictatorial powers which either the Controller or the Government have kept to themselves in some of these important clauses. Some of them, the Committee must have noted, have stated that the appeal provisions more or less are like an appeal from Caesar's decision to Caesar. That is what they have expressed, but with the experience and whatever knowledge I have of the working of these appeals which have gone to the Central Government. I have every confidence that the Central Government, whateve is the decision that they give, are not in the least worried as to whether it is going to be against or in favour of the earlier decision of the Controller. The past experience too is, it has never been uniformly O. Kaying the earlier decisions, thereby annuling more or less in effect the appeal provisions which existed. It has not been so. The Central Government would be more expeditious and it does not do any injustice to any party. The thing is it is expeditious and as against that I am aware of the elaborate time even in the trade mark cases that is taken when the parties go in appeal to the Bombay High Court or to any other High Court. The Trade Mark Agents' fees in many cases are very very high—three figure fees are charged. Considering these high figures, an appeal directly made to the Central Government would be much simpler. Then the High Court proceedings even in Trade Mark cases have been dragging on at least for 6 to 8 years in quite a number of cases. There is hardly a case which has been finished by the High Court in 3 years.

Shri B. K. Das: If there are Special Appeal Tribunals?

Dr. A. Joga Rao: As regards the Special Appeal Tribunal, I think it can be considered, but it should be open—of course as it is the Bill does make a provision for having a notification—to take advantage of the technical knowledge in any case.

The decision by the Central Government must necessarily have to be based on the technical content of the patent specifications no less than the legal aspects. As far as the technical content is concerned, the Central Government will normally have to either secure it from any one of the technical experts who are at the same time in the service of the Government, or alternatively they can secure it from independent technical experts. Now it would reassure the parties and instil greater confidence if this kind of technical opinion is openly sought and made use of by the Central Government from any outside expert.

Shri B. K. Das: You mean there is no obligation for seeking that opinion openly. But the Government must seek that opinion openly. In that case the Tribunal may create greater confidence in the appellants.

Dr. A. Joga Rao: It will, because it is said: Justice should not only be done, but it should also appear to be done.

Shri R. P. Sinha: Will you kindly direct the Government to give us a correct Financial Memorandum, because as it is it is absolutely misleading.

Mr. Chairman: We will discuss that with the Minister. We are discussing the whole Bill with the Minister. You may raise this point.

Shri R. P. Sinha: The time will be short. If you write to them....

Mr. Chairman: We are sitting for 7 days.

Shri R. P. Sinha: If you write to them that Members are not satisfied, that would be better.

Mr. Chairman: Mr. Misra will please make a note of this.

Shri R. P. Sinha: You may say at the next meeting, we must be given a revised Memorandum.

Mr. Chairman: Mr. Misra may make a note. What is your suggestion for reducing the period for the date of sealing? You said 6 to 7 years. We want that period to be reduced. It should not take more than 2 years.

Dr. A. Joga Rao: That will depend on a number of factors. If there is no opposition.....

Mr. Chairman: Even if there is opposition.

Dr. A. Joga Rao: If there is opposition, normally the due process of law has to be gone through. Notices have to be issued. They will ask for time. That has to be served and they will be submitting affidavits....

Mr. Chairman: Can't that period be reduced?

Dr. A. Joga Rao: Statute can fix it that all procedures should be completed within the such and such period. They can say that submissions have to be made by either party once and not again. But that will be denying more or less one of the important rights which the contending party has. He will say I have not looked into the report or the affidavit which he has placed before me. I have seen it just now. For that I may be given time. How can you meet that objection?

Mr. Chairman: He can be given 15 to 20 days. Why should he take years? Just as they had fixed 2 years in the previous Bill....

Dr. A. Joga Rao: In the existing Bill, it is there.

Mr. Chairman: We can also fix a period like that. Are you in favour of that?

Dr. A. Joga Rao: If a period like that is to be fixed, under normal conditions, when there is no opposition, when there is no application

for extension of time at any stage, I believe that period can be fixed in relation to date of acceptance of the application or in relation to the date of the first examination report issued.

Mr. Chairman: All right. Thank you.

(The witnesses then withdrew)

(The Committee then adjourned)
